THE BUILDING NEWS
AND ENGINEERING JOURNAL.

GUESS ESTIMATES AND VERBAL AGREEMENTS.

THE old complaint against the architect of under-estimating the cost of his designs has been fought out again in the recent important action of "Cutler v. North," a full report of which case we gave in our last issue. Into the particular circumstances of that suit we do not propose to enter, as they concern only the parties to the action; but there are certain points which are of considerable interest to architects, and a few questions that are likely to be asked. The decision of the jury is a just and welcome one, and the ruling of the judge, Lord Chief Justice Coleridge, will become a precedent of value in future questions of this kind. The main defence set up—that the architect had exceeded his estimate—is the old one, and after all, what does it mean? In very many instances it merely amounts to this: that the architect has given a rough idea off-hand of the approximate cost of carrying out a design which has not assumed any definite shape or been definitely agreed upon, or its limits ascertained; and the client has foolishly accepted the figure as a final and exclusive estimate, or, as in this last case, has wrong-headedly made it a defence to the action of an architect to recover his commission. The professional evidence adduced the other day, to the effect that an approximate estimate might have been formed which could not be less than £80,000 if the cube had been taken out, does not amount to much, as it is well known that when an architect is asked off-hand for his opinion of the cost, he has not the time or the drawings at hand to get out the cube contents, even roughly. Mr. Cutler probably, and for his own credit we cannot believe otherwise, did not like to commit himself to any definite sum when the question was asked in a vague manner by his client, and, in fact, he denied having given the limit of £30,000, as alleged by the defendant. The lesson is one, however, that might be taken to heart. Fellows of the same Institute with Mr. Cutler did not hesitate to prove the inadequacy of the amount alleged to have been given; but they could not have affirmed that any architect would hurriedly, without going into a calculation, commit himself to any definite statement of cost. That any reasonable business man should attach any value to a guess made before even an approximate cubing had been entered into, is surprising. Nor, on the other hand, is it wise of an architect even to venture a figure as to the cost of large, extensive buildings, before he has made himself acquainted with the whole extent of the requirements, which guess is so often used against him if any disagreement subsequently occurs. We blame an architect for being so precipitate as to give any undertaking as to cost at this stage. Early estimates are generally low—there is a desire not to make them look formidable; further, they are often made on sketch plans which are always imperfect. On these data the client is not unwilling to proceed, and even to hurry on the business. We have an instance of this in Col. North's wish that operations should be commenced at Averyhill, Eltham, even before the necessary quantities, specifications, and contracts had been prepared, which his architect insisted should be done before his departure for Chili. The work was commenced accordingly. We have heard cases of this sort before, where a client leaves the work in the hands of his architect to make contracts to large amounts, and to carry on the building. Such a course is never satisfactory. An architect is safer not to make himself responsible for large amounts without some definite agreement in writing. In the case referred to, the architect prepared contracts to the extent of some £85,000, which, however, was to be measured up when done—a large amount beyond the verbal rough guess by the architect of £40,000 alleged to be given for a preliminary design. A disagreement arose, as might be expected, and the defendant contended that the architect had been guilty of negligence in giving an estimate which he knew must be exceeded. On the other hand, it was not denied that the defendant had obtained a luxurious mansion, replete with every convenience and accessory, and that the work was well done. The charge of negligence is one of the easiest an employer can bring, but in this case it was not made. The admission that the work was well executed, and there was nothing to complain of, was a strong point for the plaintiff. Very often a fault is "discovered"—inferior workmanship or something not carried out as specified; but we have no allegation of the sort here, perhaps because such a charge would have injuriously reflected upon the assistant architect. Be that as it may, it is necessary to point out that some employers who complain of excessive cost very seldom consider the value of the work actually executed. If they have value for their money, they ought to be satisfied. If they say that the design is more than they desired, and that a less costly building would have satisfied them, they are still to blame for not making the cost an essential condition with their architect, instead of allowing him to run away with the idea that expenditure is a secondary matter, and their purse-strings are not tied. As we pointed out lately, both architect and building owner often mislead each other in this matter. If the employer is extravagant in his requirements, asks for a splendid mansion with large rooms, marble staircases and halls, picture and sculpture galleries, conservatories, and winter gardens, stabling and other accompaniments of a gentleman's residence, he cannot reasonably turn round upon his architect and charge him with having exceeded the cost. No restriction is put on the designer's freedom, and if the value of the materials and labour expended on the work can be guaranteed by actual measurement and valuation, how can the client be said to pay too much for his requirements? Unless, perhaps, he thinks the brains of his architect are his property, he has no right to expect him to give an explanation of every hundred pounds expended. There are not a few clients, like Colonel North, who refuse to pay their architect's commission on an amount which is trifling to them, expended on their own self-gratification to possess a splendid mansion. Such employers never regard the study and labour necessary in the design, the selection of good models and details, of appropriate decoration and fittings. Their one object is to obtain all they want at the least possible expense, and to cut down the architect's commission to a minimum. Even with such sums for builder's work as £99,396, and decorative work as £35,456, the architect's commission of 5 per cent. on the first and 7½ per cent. on the latter is begrudged.

An important question which arises out of this action is, on what amount the architect can claim to recover commission? That is to say, Is he entitled to recover his percentage beyond the amount he had first estimated? The defence alleged that he was not. Thus if an architect gave his client a rough idea that the building would cost £40,000 and it actually cost over £99,000, he should only claim a percentage of 5 per cent. on the smaller amount—a proposition too preposterous to entertain. But the idea commends itself strongly to the unprofessional mind, which thinks that if the estimate is exceeded the architect should bear the loss for his negligence or inaccuracy: a conclusion that would be fair enough if the additional expenditure were incurred by the architect. Again, it was contended that the commission should not be recoverable on the cost incurred after the architect was suspended—a plea which does not take into account that an architect's design and services are for the whole and complete work for which he has prepared plans and specifications, and cannot be divided or cut off at any point. The "commission note" from architect to defendant confirming the conversation as to professional services was the turning-point in the case, as there was nothing mentioned about the amount, but simply the rate of commission —7½ per cent. on the total amount of the decorative work and 5 per cent. on the building, the latter being divided between Mr. Cutler and his assistant architect. The memorandum was accepted by the defendant, who had no leg to stand upon. Had this note not existed, the issue of the case might have been different. The importance of a written agreement between architect and client is brought prominently to the front in these

proceedings, and is a point that deserves the attention of everyone engaged on works, especially on those which are likely to exceed the estimate. In buildings of the extent and character of those at Eltham it would be fair to owner and satisfactory to the architect if there was an agreement to pay the usual percentage up to a certain amount—say that of the contract, and a smaller commission on any further expenditure. When an architect's charges are calculated on so large a sum as £104,000, it may be reasonable to make some reduction in the rate. A very unfortunate and prejudicial public opinion exists that it is to the architect's interest to run up expenses, hence it is necessary to remove the impression. The percentage commission has, on this ground, not been favourable to the profession, and the sooner some more rational mode of remuneration is devised the better. Why an architect should not charge a "lump" sum like a painter or a sculptor, is a question that has never been clearly answered. The architect would be saved many anxious moments as to supposed conversations about limits of cost, and the public could not run away with the idea that it was the architect's interest to increase cost. Another weakness is brought out in the case: that of reliance on verbal understandings. We have repeatedly shown how worthless these understandings are in building transactions. A client may extort from the architect a kind of hap-hazard statement as to cost, which means practically nothing more than a random guess about work of which he does not know the limit; while the architect may receive a verbal assurance that his 5 per cent. will be paid, but upon what amount is not clear. These are matters that should be fixed unalterably by writing. Young architects appear to be afraid of this course: others do not like to commit themselves to written statements. But the source of all difficulty and all trouble with employers is the hasty and ill-considered answers to questions before any calculation either by cubing or more detailed process has been made. A few hours' labour will enable a fair approximation of the cost to be ascertained, and surely it is better not to satisfy the curiosity of the client, who on the spur of the moment may commit one to a statement that cannot so easily be repudiated.

ONE-STORIED BUILDINGS.

FEW arrangements are satisfactory, architecturally, in which the buildings are spread over a large area of land, and for the purpose of illustration we may cite a large county infirmary or hospital, the several blocks of which are separated by wide spaces from each other, and are of single story. The chief satisfaction an architect gets out of a design of this kind is that of grouping his buildings, and in arranging his blocks on some symmetrical plan, so that when they are seen at a distance, or from rising ground, the design may be comprehended as a whole. When such a bird's-eye view cannot be had, the result is by no means an agreeable one, as the single-story pavilions or offices destroy all architectural solidity and mass, and the appearance presented is that of a hetereogeneous collection of buildings or sheds without cohesiveness. The single-story building is not a favourite one with the architect. Even in those cases where he is not limited in cost, and where he can give an architectural character to the walls and roof, the problem is not easy. Soane, in the Bank of England, has shown the possibility of making a one-story, or at least a one-Order, façade, and although some portions of this building is three storied, the treatment externally has all the effect of a single-story building. Of course, we except such edifices as St. George's Hall, Liverpool, the Birmingham Town Hall, and other colonnaded structures of large top-lighted apartments and halls, which have a height and dignity which give them a monumental character, and confine attention to those smaller and more modest buildings with which the architect is so often called upon to deal.

What to do with a single-story pavilion to make it presentable externally, is not very obvious. The facile pencil of the artist may invest such a building with a piquancy or expression of its own by a few of those touches and licenses of the pencil which are so telling in perspective drawings; but where the stern realities of practical construction have to be considered free from those little exaggerations of scale and proportion which are permissible in a drawing sent in for competition purposes, the matter becomes a very different one. The use of high parapets and corner piers carried up as turrets, with lofty roofs of the Mansard form may give a dignity to the structure, but when one has to deal with certain heights, with plain, overhanging eaves and plain walls with sash windows in them, a by no means exalted effect is the reward of our labours. Practical, commonsense, and ugly are terms which express more fully the result. Elevation can be given by raising the ground-floor level as high as possible, and by adopting high-pitched roofs. But how can these expedients, useful as they are, make a row of single-story pavilions look anything but a very "sorry" row of sheds? We can commiserate with the architect in having to design a building of this character; but we know that hospital authorities have unanimously decided upon the advantages of this mode of ward construction.

The requirements of ventilation and top-lighting often make it imperative to adopt single stories. Large areas covered by buildings are necessarily made up of buildings of single stories. Take, for example, the administrative block of a large hospital or school. The kitchen offices and stores are generally one-story high, the front portion only being carried up. When the building is erected the appearance of the central block has an unfinished look, and where a massive structure was expected nothing but the roofs of lower buildings appear. Incorporation with the higher portions of the building is almost impossible. The joining of the lower roofs against the walls of the higher structure is never pleasing, the junction of gutters and valleys often awkward, insecure, and expensive, and the general effect of the whole group is spoilt. The habit of mentally seeing what parts of the structure are carried up and appear is not one of the faculties which those who prepare plans for competition acquire very readily. The plan is delusive on this point: it shows a good arrangement of rooms and corridors; but directly the walls that go up appear above the surrounding roofs, the ideal is lost. This delusiveness of plan in disregarding the actual effect of the building when completed is often to be observed in competition designs. For instance, let us take as an example a set of designs for public baths and washhouses. By the necessities of a design of this nature the buildings are mostly of one story. The swimming-baths are necessarily carried up to a certain height, and lighted by a lantern in the roof, which is of iron; while the smaller private baths are roofed over at a much lower level, together with the washhouse, laundry, and other offices. How slight is the opportunity of making such a set of buildings architectural? The semi-engineering character of this kind of building would be a reason for handing it over to an engineer; but the notion is repugnant to the pretensions of the architect. Yet, after all, there is very little that will admit of architectural treatment: the swimming-bath, in its usual form and construction, is by no means capable of being made a feature of attraction. The roof must be economical, and admit light through it, and the type of iron roof with skylight used by engineers in railway stations is frequently met with. Economy also dictates a similar roofing over the private baths and wash-houses. The whole design resolves itself into a number of single-story compartments top-lighted. The large baths may be built high, and are made to represent halls with windows above the roofs of the lower portions; but there is little to suggest an external design, except the front, which may be a block of administrative offices. Polytechnic and technical school buildings are also composed largely of single-story compartments. The workshops and the baths attached to the former are kept low; but as these parts can be arranged behind or be inclosed in the blocks of the main buildings, their lowness does not so materially affect the whole group.

It may be argued that architecture is very little concerned with designs of these descriptions, in which the "plain shed" enters so largely. But the problem is one of the day, and it is for the profession to see how an assemblage of one-story structures can be made agreeable and coherent. To make a façade we must have two or more stories or an elevation of some height; but the low, single-story structure seems to defy all canons of good architecture, as far as external conditions are concerned. There seems to be only one way by which single-story buildings can ever hope to be brought within the rules of architectural composition, and that is to study them on the ground plan—not at random to suit crooked corners of the site, and to be hidden by other higher blocks as if they were merely temporary sheds. Make them portions of the integral masses connected with the main and higher blocks in such a manner that they may appear to balance and become accessory features. The high blocks that appear in the general view or perspective ought to be made to have some connection with those portions that are low-roofed, instead of being totally indifferent to their humbler purposes. A large and ramified public building under one single roof, inclosing within its external walls every minor office, is imposing, but wastes room, unless mezzanine floors are provided, and is certainly less healthful, inasmuch as it sacrifices top-light and ventilation to windows for the sake of external uniformity.

A SANITARY CRUSADE THROUGH SOUTH AFRICA.

(*Continued from page 895 in last Volume.*)

PRETORIA, the capital of the Transvaal, which may be said to be the richest mineral country in the world, though only about forty miles from Johannesburg, is not an easy place to reach when, in the rainy season, the rivers are "up." The tracks are certainly the worst and most dangerous in the whole world to travel upon, accidents involving loss of life and limb being of frequent occurrence. A few days previous to Mr. Boyle's visit to Pretoria, the coach that runs between Johannesburg and the capital was washed away when crossing a river, and it was with the greatest difficulty the passengers were rescued, seven mules being drowned. A number of Boers crossing in a "pont" with cattle were also washed away and all drowned.

This state of affairs on the main highway is discreditable to the Transvaal Government, as bridges could easily be built over all these rivers, and a considerable annual saving effected in life and property. An attempt was at one time made to build an iron bridge across one of the rivers; but the first high-water washed the foundations clean away, and nothing has been done since, though it is understood that another attempt is shortly going to be made.

Pretoria is charmingly situated in a valley surrounded with low hills well wooded. The town is laid out somewhat after the plan of Salt Lake

TOWN HALL, DURBAN, NATAL.

City, which it resembles both in appearance and situation. There are a number of handsome and substantial buildings in the principal streets, and others are in course of erection, which, when finished, will greatly add to the appearance and importance of the place. The new Houses of Parliament, now drawing towards completion, form a very imposing and striking feature, and speak volumes for the advance the Boers are making in their appreciation of the higher forms of architecture. Mr. Boyle has submitted a scheme for the ventilation of the building, which he surveyed for that purpose. The air-pump ventilators are adopted for the new Pretoria Club, Court House, Hospital, and other buildings.

Messrs. Zwann and Van Dyck, the Dutch architects at Pretoria, report: "We have had the experience that your ventilators are highly satisfactory and prescribed for many works."

The pail-closet system is employed, and the water supply is abundant and good. The town will shortly be lighted with the electric light and provided with electric street cars.

After another rough experience of day and night travelling by coach, Mr. Boyle entered Natal, "the garden of South Africa," skirting the fatal Majuba Hill and crossing the famous Lang's Neck. He visited the graves of the gallant soldiers who were sacrificed there, amongst which was that of the ill-fated General Colley, and was glad to see that every care was being taken of the place, and that the fallen brave were not forgotten. Pietermaritzburg, the capital of Natal, is very finely situated, and seems to be embowered in a large park or garden. There are several handsome buildings in the town, the most imposing being the House of the Legislative Assembly, of Classic design, and which is ventilated with the air-pump ventilators. Colonel Hind, Chief of Public Works, under whose direction the ventilators were applied, states that the ventilation is "very successful." The air-pump ventilators are in use at the Barracks, and are adopted for the ventilation of the new Town Hall and Municipal Buildings, also the new railway station, which are in course of erection from the designs of Messrs. Street Wilson and Barr, who have adopted Messrs. Boyle's system for, amongst other buildings, the new railway station, Durban, and the hospital. In a letter to Mr. Boyle they say:—"We are glad to hear that you are arranging for a stock of your ventilators to be kept here. We have specified them to be used in the new Pietermaritzburg Town Hall, and other buildings which we are carrying out."

The business portion of Durban is situated on a sandy neck of land, the better class of residences being built on one side of a finely-wooded hill at the back, named "The Berea." According to the census of the South African Colonies, which has just been completed, the population of Durban is about twenty-five thousand, though the proportion of natives over Europeans in Natal is very great, being as high as ten to one. The pail-closet system is used in Durban, but it is proposed to adopt a complete water sewerage scheme which has been prepared by the borough engineer, Mr. J. Fletcher, C.E., and which seems to be a very perfect system, embracing all the latest improvements. Pneumatic ejectors will be employed, and the sewage have its outfall into the Bay Channel, where there is a very strong tide or race, which will carry the sewage with considerable velocity out to sea, and clear of the coast. It is proposed to ventilate the sewers by means of vertical shafts and ventilators, and plans and estimates of the Boyle system have been prepared.

Mr. Fletcher writes:—"I predict that your well-known air-pump ventilators will be largely used in Durban." There are a very large number of Hindoos in Durban, who, from their filthy habits are, along with the Kaffirs, a standing menace to the health and safety of the inhabitants. No female dare walk out unprotected after dusk, nor in unfrequented places during the daytime, the number and daring character of the outrages committed by Kaffirs being alarmingly on the increase, in spite of the death penalty being inflicted for this offence. Unless strong measures are taken to effectually put a stop to this scandalous state of affairs, a woman's life in Natal, as it, in fact, is at the present time, must be one continual terror.

The Town Hall, of which we give an illustration, is considered one of the finest architectural structures in South Africa, and it certainly is a very stately pile. It was designed by the late Mr. Dudgeon. The ventilation is carried out on the Boyle system, the central flêche on the roof containing an air-pump ventilator 6ft. in diameter. This building is esteemed to be the best ventilated in the colony. Mr. W. H. Powell, F.R.I.B.A., Durban, states:—"I have been in the habit of specifying your ventilators for several years; I know of nothing better of their kind."

The Masonic Hall is one of the largest and most conspicuous buildings in the town; it is also ventilated with the Boyle system. The architect, Mr. M. Holmes, reports:—"I shall always have much pleasure in recommending your air-pump ventilators for use in Durban and elsewhere, as from practical experience I know them to be a thoroughly good and useful article."

The water supply is fairly good, and a scheme is now under consideration to provide a practically unlimited supply.

Messrs. Parker, Wood, and Co. (Limited), Durban, who have branch houses all over South Africa, have been appointed Messrs. Boyle and Son's agents for Natal, the Transvaal, Kimberley, and Harrowsmith, Orange Free State.

Delagoa Bay, though a splendid harbourage, is an exceedingly unhealthy place for Europeans, and fever abounds, caused by the malarial exhalations from a very pestilential swamp, which, however, might, without much difficulty, be filled up, and the place rendered comparatively healthy. There is a probability that this may soon be done, but not by the Portuguese, when there will be a big contract for some engineer. The sanitary condition of the Port Lorence Marques is a disgrace to a people professing to be civilised. The Portuguese all along the East Coast, whatever they might have been at one time, are now mostly a degraded lot of half-caste rascals, whose principal occupations are the slave trade and selling to the natives strong drink of a most poisonous description, which is rapidly decimating the coloured population of South Africa. These scoundrels are a curse to the country, and the sooner they are ousted the better it will be for civilisation and humanity. The public indignation excited at the disgraceful treatment by the Portuguese of Sir John Willoughby and his party when they recently attempted to enter the Pungwe river from Port Biera on their way to Mashonaland will certainly go far to hasten the end, and from what Mr. Boyle learned from Sir John Willoughby himself and others of the party, whom he met at Durban on their return from Port Biera, the published accounts of the affair are in no way exaggerated, but, on the contrary, rather minimise the enormity of the outrage.

There will soon be a profitable opening in Mashonaland for all connected with the building trades, and it should not be lost sight of. Skilled artisans, for which there is even now a demand, such as joiners, bricklayers, stonecutters, and metal-workers, will have no difficulty in earning ten to twelve pounds a week. Labourers should not go to South Africa, as natives do all that class of work.

The Pungwe route is much the cheapest and most expeditious, though not at present the healthiest, being only 400 miles from Port Biera to Fort Salisbury, over a hundred miles of which

is by river. Transport costs at present one-sixth less than viâ Cape Town and Mafeking, Bechuanaland, though this is much the healthiest and most comfortable route. Mr. Boyle travelled through Kaffirland, and visited a number of Kaffir Kraals, or villages, which he was pleased to see were kept very clean and orderly, the natives being civil and obliging, and free from the vice and dirty habits of those who live about towns and become civilised (?)

Grahamstown reminds one of an old English town, and somewhat resembles Bath, the situation and surroundings being very similar. It possesses a handsome cathedral with a fine stone spire, which is a landmark for miles around. The cathedral is at present undergoing alterations, and a chancel is being added. The ventilation will be carried out on the Boyle system. The architect, Mr. W. White Cooper, M.A., Grahamstown, states: "I have very much pleasure in testifying to the value of your air-pump ventilators, knowing them from experience to be the best in the market." The Asylum, St. Andrew's College, and other buildings in Grahamstown, are ventilated with the air-pump ventilators. This town is considered very healthy, the sanitary arrangements being well looked after, and the water supply good. Port Elizabeth, which has a population of 20,000, and claims to be the principal commercial town of the colony, has a thriving and substantial appearance, being finely situated on the shores of Algoa Bay. From the natural advantages of its position it ought to be a well drained and thoroughly healthy town; but, like Cape Town, it is at present certainly not the one, nor can it truthfully be said to be the other, the smells arising from the defective drainage, so far as there is any attempt at drainage, being very bad indeed. It is now proposed, however, to have all this changed, and Mr. Boyle, along with the mayor and other officials, made a survey of the existing arrangements, and plans and estimates have been prepared for the application of the Boyle system, which it is proposed to adopt. A new theatre and opera house are in course of erection, the ventilation being carried out on the Boyle system. The architect, Mr. George W. Smith, the Government Surveyor, reports:—"Although, so far, I have not used many of your large-size ventilators, a good many of the smaller sizes have been erected in public and private buildings. I am quite sure if your valuable ventilators were easily procured here, nothing else would be used." The air-pump ventilators have been adopted for the Hospital, new railway station, and new schools, and plans have been submitted for the ventilation of the Town Hall and Municipal Buildings.

Messrs. Griffiths and Co. have been appointed Messrs. Boyle's representatives at Port Elizabeth and for the Eastern Province of Cape Colony. There is, without doubt, a great future before South Africa, and as a health resort alone it is unrivalled, especially for those suffering from pulmonary complaints, and many of the leading medical men in Europe now recommend their patients to go there. On his return journey, Mr. Boyle visited the Islands of St. Helena, Ascension, Teneriffe, and Madeira, the sanitary condition of which places were found to be fairly good. At St. Helena a visit was paid to Napoleon's tomb and "Longwood," the house wherein Napoleon died; but it was melancholy to witness the meagre remains of the internal portions of the house, which have been stripped of most of the original material and replaced with rough, common stuff.

There are few, if any, who possess such a thorough knowledge, gained from actual observation and practical experience, of the various methods of ventilation employed in the different countries in the world as Mr. Robert Boyle, he having, in the course of the last quarter of a century, visited, it may be said, every country, and noted the requirements of each, and the success of the ventilating arrangements adopted. The merits of Mr. Boyle's system are well known, and it has certainly achieved a success attained by few inventions, and made his name in connection with ventilation a household word throughout the world.

THE ROYAL COMMISSIONERS' REPORT ON WESTMINSTER ABBEY.

THE final report of the Royal Commission appointed to inquire into the present want of space for monuments in Westminster Abbey has just been issued. The Commission consisted of the Hon. D. Plunket, First Commissioner of Works, Sir A. H. Layard, Sir F. Leighton, P.R.A., Dean Bradley, Mr. L. J. Jennings, M.P., Mr. A. Waterhouse, R.A., and the Hon. Harold Dillon. The report opens with an historical review of the series of events by which the Abbey has from its foundation been constantly identified with English history. It groups the many suggestions made since 1854 for providing additional space for memorials in order of locality as follows:—

1. The addition of a building on the north side of the nave.
2. The adaptation of the existing Chapter-house.
3. The acquisition of a site and the erection thereon of a cloister or chapel to the east and south of Poets' Corner.
4. The utilisation of a vacant space adjoining and communicating with the south side of the Great Cloisters.

Each of these proposals for additions is dealt with in detail. The first is that favoured by Mr. J. L. Pearson, R.A., who brought out two plans for solving the problem, either by (*a*) an additional aisle to the nave with chapels attached for the display of monuments, or (*b*) a double cloister, glazed on both sides, inclosing a garth, with approaches from the Abbey. Notwithstanding the weight due to the high authority of Mr. Pearson, the Commissioners are unable to approve of the expedient he advocates, either on its own merits or as a scheme in competition with others suggested for the south and south-east sites. "The objections are grave and practical; and even admitting that it is free from any difficulties connected with the acquisition of a site, advantage so gained would be outweighed by obvious drawbacks and by the unpopularity which would certainly beset its adoption."

The proposals for the adaptation of the fabric and site of the existing Chapter-house and its vestibule are, we are glad to see, dismissed as impracticable, while as the Chapter-house passed three centuries since into the possession of the Crown, it is virtually unavailable as a monumental chapel. The scheme of the late E. J. Tarver to build a wreath of chapels round the Chapter-house would, the Commissioners think, "entirely change and destroy the character and charm of this ancient and picturesque edifice." Another proposal, one of four distinct parts of an extensive and costly scheme laid before the Commission by Mr. J. Pollard Seddon, on behalf of himself and Mr. Lawrence Harvey, is almost identical with the suggestions of Mr. Tarver. It is described by its authors as a design for "a cloister of six chapels surrounding the Chapter-house." In the opinion of Mr. Pollard Seddon these chapels "would materially improve the exterior effect of the Chapter-house," an opinion in which the Commissioners are unable to concur.

Both the late Sir Gilbert Scott and the late James Fergusson proposed the acquisition of a site and the erection thereon of a cloister or chapel to the east and south of Poets' Corner. Mr. Pearson has prepared a scheme on somewhat similar lines, showing a "monumental chapel" facing east and west (instead of a "transept" running north and south, as suggested by Mr. Fergusson), which would be erected on the site occupied by Nos. 2, 3, and 4, Old Palace-yard, and the ground at the rear of those premises up to the boundary line of the Abbey precincts. A somewhat similar proposition was submitted by Mr. Somers Clarke, F.S.A. It differed from Mr. Pearson's plan in that it would cover the sites of Nos. 1 and 5, Old Palace-yard, in addition to those of Nos. 2, 3, and 4, and would present a frontage almost identical in line with that of those five dwelling-houses, the leading principle and greatest attraction of both schemes (that of Mr. Pearson and that of Mr. Somers Clarke) being that the new building would be actually united with the Abbey church by a covered way.

Of these two proposals, that of Mr. Pearson appears to the Commissioners to be less open to the objection that the erection of any structure on a site cleared by the removal of the Old Palace-yard houses must mask the outlines of the Chapter-house, and interrupt the view of the Chapel of Henry VII. In order to meet the objection, which he acknowledged, Mr. Pearson prepared a modified plan, occupying a site 25ft. further to the south. The Commissioners agree with him that this would be less open to criticism. In the last place, the Commissioners considered the question of the utilisation of a vacant space adjoining and communicating with the south side of the Great Cloisters, on the site of the refectory, which was favoured by Mr. Pearson. He proposed to add a row of columns along the north and south sides of the building, and to groin over the whole space in stone. The arcading which exists in the north wall could be preserved, and columns could be built in advance of the wall, arches being turned at the level of the top of the Norman arcade, which would carry the walls. Mr. Pearson roughly estimated the cost of such a building at about £30,000.

In such a building room would be found for national commemorations for 100 or 200 years to come; and it might be the first instalment of a larger design for covering later on the whole extent of the refectory and Ashburnham-house, should it ever be restored to the Abbey, with another cloister, of which the proposed chapel should form the northern side. The adoption of this plan has, in the opinion of the Commissioners, a further special merit not shared by any other brought forward—namely, that it would be hardly, if at all, visible from the outside, and, therefore, could not interfere or come into comparison with the Chapel of Henry VII., the Chapter-house, or any of the other older buildings.

The conclusions and recommendations of the Commissioners are as follows:—

We have to report that space may probably be found beneath the floor of the Abbey for interment for at least 100 years to come if the duty of granting such burial be discharged sparingly and with careful regard for the greatness of the national honour thereby conferred; but that no room now remains in the interior of the building for important monumental commemorations. . . . We are of opinion that no interference with existing monuments short of removal or rearrangement on a large scale would provide adequate facilities (for the continuance of the roll of such monuments).

We find that provision adequate for such commemoration cannot be made in any existing building within the precincts of the Abbey, nor in any place not immediately connected with it. We have, therefore, taken evidence and considered plans for providing at the Abbey an additional place for memorials; and we have further to report that of the various schemes which have been brought before us there are two which we commend as specially suited to the purpose. The one proposes to clear an area now occupied by certain houses in Old Palace-yard, and to erect upon a portion of the ground so cleared a monumental chapel connected with the Abbey at Poets' Corner.

We recommend, whether the latter part of this proposal be adopted or not, that no time should be lost in removing the houses in Old Palace-yard above referred to, which not only conceal to a great extent the architecture of the Chapel of Henry VII. and the ancient Chapter-house, but are also a constant source of danger to the Abbey from fire. The other plan contemplates the erection of a monumental chapel on a vacant piece of ground, the site of the old refectory, lying immediately south of the Great Cloister and parallel to the nave of the Abbey. We believe that one or other of these last-mentioned schemes would provide a solution of the problem which has been submitted for our consideration. After a careful review of the arguments, we recommend that of the two schemes the latter should be adopted, and that, in order to carry it out, so much of the land required for that purpose as, under the Public Schools Act, 1868, became vested in the Governing Body of Westminster School, should be reconveyed by statutory enactment, if necessary, to the Dean and Chapter of Westminster Abbey.

All the Commissioners sign the report, but Sir A. H. Layard, Sir F. Leighton, and Dr. Bradley append a minority report, stating that they feel themselves obliged to dissent from its last paragraph, which recommends the adoption of the refectory site, and from such other passages as point to that conclusion; and advise that preference should be given to the site at the south-east of the Abbey.

THE MASTER BUILDERS AND THE LONDON SCHOOL BOARD.

A MEETING of master builders was held on Monday afternoon "to protest against the manner in which the School Board for London deals with their work, bills, and payments."

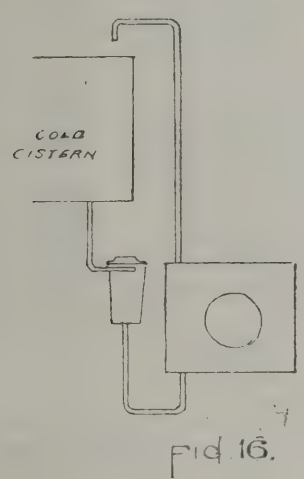
Mr. Dove was in the chair, and other firms represented included Atherton and Latta, Dearing and Son, Charteris, Cubitt, Seeley, Lathey, &c. It was stated that the meeting had been called because of the builders being so badly treated that some of them had refused to do further work for the London School Board under present arrangements. They not only had their bills shamefully cut down, but had to threaten legal proceedings before they could get their money. One builder stated, as an instance, that the Board at one time owed him nearly £500, and, in response to an application for a settlement, a cheque was sent for £3 17s. 5d The system adopted by the School Board for their repairing accounts and schedule prices was declared to be one that was worrying to the builder, and also one that must necessitate an increased staff of clerks at the central offices of the Board to check the bills. The builders had to insert every item of repairs, such as "one screw ½d.," "three yards of cord 2d.," and so on, leading to extra cost in the builders' offices as well. The system had become so intolerable, and the periods of payment so extended, that the builders had tacitly agreed not to work under present arrangements. Mr. Cook, a member of the School Board, sent a promise to the meeting to introduce a deputation to the School Board, and this offer was accepted, with thanks, the date to be fixed later on.

HOT-WATER ENGINEERING.—V.

SUPPLY OF HOT WATER FOR BATHS AND DOMESTIC PURPOSES.

THE TANK SYSTEM (*concluded*).

THERE remain two more essential features in the tank system to notice—viz., the cold-supply and the expansion, or steam escape, services. There used to be an idea that the cold-supply service from the house cistern to the hot-water tank had necessarily to have an intermediate cistern placed beside the tank, as Fig. 16. The real object sought to be attained by



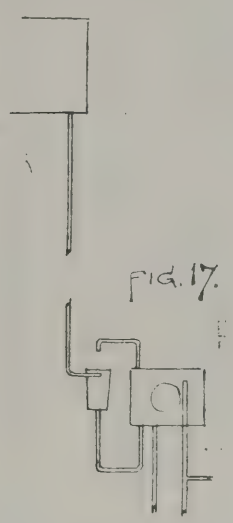


FIG 16.

this arrangement is obscure, if even there was one. It certainly introduces a great drawback in the use of the ball valve, as these articles, even the best of them, are very far from being perfect; and they are perpetually getting stuck or irregular in their action. The necessity of having a ball valve with a short arm that would work in these small cisterns, greatly aggravates the matter, as the length of the arm which has the ball on the end has greatly to do with the success of nearly all these articles. In addition to this, the small cistern had to have an overflow service fitted as usual.

If the tank is up anywhere near the house cistern, there is no occasion whatever to use this intermediate cistern, and the service should be brought down direct, as Fig. 12, the only special features being the stop-cock and the dip, or "siphon," as it is wrongly called, in the pipe near the tank. If, however, the tank was a long way, say 20ft. to 30ft., below the house cistern, by reason of hot water not being required in the upper part of the house, then an intermediate supply cistern could be used; but the only gain effected is that it makes it unnecessary for the expansion pipe from the top of the tank to extend up to the house cistern, as it would have to do if no intermediate cistern was used. Fig. 17 shows an apparatus in which the supply cistern might be used to save the erection of the high expansion pipe.

It is very important that the stop-cock in the supply pipe be of full size. If it is a 1in. cock, it should have a "full way"—that is, the passage through it should be of 1in. diameter

FIG. 17.

from end to end; these are a little more costly than the ordinary cocks, but decidedly necessary. If an inch cock of the common character were used, the passage through it would hardly be ¾in. clear, and this choking of the service would have the same effect as reducing the pipe to ¾in. all through, so that it is an unnecessary expense putting a 1in. pipe in if the tap has only a ¾in. way through it. The cold supply-pipe should never be less than ¾in., even in small works, as the size of this pipe controls the flow of hot water from the taps when they are opened. The stop-cock should be labelled, and it should have a loose key to be kept in charge of someone who will only permit authorised workmen to use it.

The object of the dip in the cold-supply pipe, the part that dips down below the tank a little way, is to prevent hot water finding its way up this pipe into the house cistern, where it would be very unnecessary, particularly in the warm weather, when water cannot be got cold enough.

In experimenting with a glass apparatus, it will be found that a sluggish, but nevertheless certain and permanent, circulation will set in up a *single* vertical pipe, the warm particles of water ascending up the centre and the cooler particles descending down the sides of the pipe. This circulation is not sufficient in its strength to be of any practical service; but it would be found sufficient to bring about ill results if it was allowed to act in the cold supply service from the house cistern. It will be seen that this circulation is too feeble to overcome obstacles, and by starting the cold-supply pipe from the tank in a descending direction, the circulation becomes an impossibility, and no hot water finds its way from the tank to the house cistern, although there is a free communication between the two.

The expansion or steam pipe from the top of the tank is provided for the free escape of steam when it is generated, and it also allows of the slight rise and fall of the water that necessarily takes place as it is heated or cooled, for water expands about one-thirtieth when heated from 45° to boiling-point. There must, of course, be this open expansion-pipe to every description of apparatus; it is, in reality, the safety-pipe, for if this were omitted—the tank being sealed up water-tight—it would be considered highly dangerous, although an accident could not actually occur while the cold-supply pipe was open. The pressure of expansion would relieve itself through this latter direction, and if steam was generated it would escape the same way, although it would create a terrible commotion in so doing. It would not pass out this way until it had gathered sufficient strength to lift and carry the water before it.

This expansion pipe should terminate some 3 or 4 feet above the cold-water cistern, to allow for the water-level in this pipe being higher (due to its expansion) than that in the cold cistern, and it may either turn over the cold-water cistern, as shown, or be carried through the wall or roof. It has to be remembered that if the apparatus overheats, boiling water may be ejected from this pipe. The lower extremity of this pipe should not be allowed to dip down inside the hot-water tank, and on this account it is best to have a flange for the pipe to be screwed into, rather than securing the pipe inside with a backnut. The effect of projecting this pipe through inside the top of the tank is the same as screwing the flow-pipe through the top of the boiler (see Fig. 13), although it is not so noticeable—in fact, it would only result in noises when the water was boiling up in the tank, a thing that does not commonly happen.

From the illustrations, it will be noticed that the tank is shown as being situated below the cold-water cistern. This is, however, not always the case, although, let it be clearly understood, it is decidedly preferable. Sometimes it is decided to place the tank in the roof, alongside the cold-water cistern, this position permitting the tank to be placed out of sight—there can be no other reason—whereas, on the other hand, the disadvantages and ill-results are very great.

In the first place, the tank necessarily loses heat rapidly in this cold situation, a loss that is directly opposed to the object for which the apparatus is erected—viz., to provide heated water from taps, and not to permit the heated water to diffuse and dispose of its heat in useless places. It is, of course, most extraordinary to erect an apparatus which permits of the fire being stoked and fed, with the result that only half the heat imparted to the water issues from the taps; yet how many such are there in use at this day—they can be met with everywhere. A perfect apparatus would be one which conserved every particle of heat that it absorbed from the fire, and only parted with it with the water that issued when the tap was opened; and the writer hopes to show presently that this can be very nearly effected with the most agreeable results at little trouble and expense, and a most decided economy in fuel.

When a tank is placed on a level with the house cistern, the cold-supply pipe has to be connected in the manner already described,

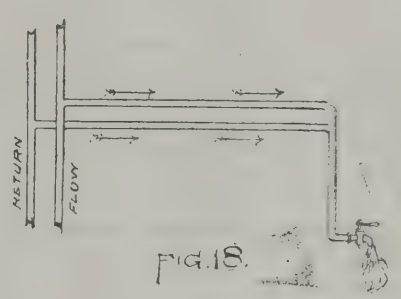

FIG. 18.

although some people consider the stop-cock is not needed, as the cold cistern being so handy it is thought this can be plugged as easily as closing a stop-cock when it is desired to shut off the water. It is not a commendable practice, however.

The particular objection to placing the tank level with the cold-water cistern is that as the day passes the water-level in the cold cistern sinks, which in all probability will cause the tank to run partially empty by evening time. If the demand for water is fairly great, and the cold-water cistern is not of ample size, the water-level may sink below the top of the flow-pipe in the tank, and this would entail the worst possible results.

The last important feature in the Tank system to be noticed is the connection of "returned" draw-off services. It has been mentioned that draw-off services in this system are taken off the flow-pipe at any point between the boiler and the tank. Now, if the nearest point in the flow-pipe is some 30 to 40ft. from the place where the tap is required, and a single pipe is run this distance, an objectionable feature is introduced, in the fact that the water in this pipe being stationary is cold, and has to be drawn off before any hot water can be obtained. When water is drawn the pipe becomes charged with hot water; but this quickly gets cold, so that as a rule the contents of this pipe have to be withdrawn and wasted whenever the tap is applied to. This is no objection at a bath which usually wants some

cold water, which might as well be drawn first as last; but at a lavatory basin it is a great annoyance, as the taps being small, it seems an endless time before hot water is obtained. At the servants' taps it is generally considered an annoyance, although of a less pronounced character. The remedy for this is to return the draw-off service, so that the water will circulate within it; but here an objection is introduced which is not as generally understood as it might be.

It must first be explained that a proper knowledge of what happens when a tap is opened is not possessed by every one, and if a person were asked from which direction the water came that flowed out of a tap—whether down from the tank or up from the boiler—few could speak with certainty; and the least would guess that half proceeds each way, as is actually the case. Now, if we take a draw-off service from the flow, and return it into the return, as Fig. 18, which is the customary way of doing it, the water will circulate in the service very well; but when we open the tap the water will proceed as indicated by the arrows, so that nearly as much cold water will be obtained as hot. The return of this service into the main return opens up a direct passage from the cold-water cistern to the tap, a very undesirable end.

There is no better way of returning the draw-off service than this, but the very bad feature just explained can be greatly minimised by using a small sized pipe for the return portion of the service, as we do not need a rapid circulation here, all that is needed being sufficient movement to keep the water from being absolutely stationary and getting cold. A very sluggish circulation is sufficient.

Sometimes a remedy is effected by putting a stop-back valve in this draw-off return, this valve permitting water to pass it one way only. Sometimes it can be conveniently arranged for the flow-pipe to be taken by a longer route, so as to come near all taps (the return pipe being taken by the most direct route between the tank and boiler.

The next paper will deal with the more modern cylinder system.

PRICES.—VIII.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

VESTRY *charges for opening roads, connecting to sewers, making good, &c.—(Continued.)*

WESTMINSTER (ST. JAMES'S, PICCADILLY).

The charges for connections to sewers are:—

	£	s.	d.
For a 6in. connection	0	14	6
Ditto 9in. ditto	0	18	6
Ditto 12in. ditto	1	5	0

Builders lay pipes in the roadway between the connection to sewer and house.

The charges for making good paving &c., are as follows:—

	£	s.	d.
Wood paving ..... per yard super.	0	12	6
Asphalte ..... ditto	0	18	6
Macadam ..... ditto	0	2	6
Granite pitching ..... ditto	0	2	6
York stone (relay) ..... ditto	0	1	6
Ditto new ..... ditto	0	9	0
Kerb relaid ..... per foot run	0	0	3

WOOLWICH.

There is no schedule here, but the actual cost is charged in all cases.

CITY OF LONDON (COMMISSIONER OF SEWERS, BASINGHALL-STREET).

No scale of charges exists, but each matter is treated separately, and charged on the cost.

MASON.

A list of the various stones not treated in detail here will be given at the end of this trade for reference.

BATH STONE (INCLUDING PROFIT).

ARCHITECTURE OF THE RENAISSANCE IN ENGLAND.

THE subjects represented in the second part of Messrs. Gotch and Brown's folio, just issued by Mr. Batsford* to subscribers, are in several instances taken from less known buildings than most of those grouped in the first part, which we noticed early in the year, at the time we gave a view of Park Hall, Oswestry, as a specimen plate.† This being the case, the illustrations are, if anything, more interesting. The descriptive text is certainly more copious, and the plans and detail sketches in the letterpress are more numerous than before. Bradfield, near Cullompton, a sadly mutilated mansion has a grand drawing-room, with much rich woodwork and a beautiful angle porch in it, besides a Jesse Tree chimneypiece. This apartment furnishes the first plate. The next is of the Guildhall, Exeter, with its projecting Council Chamber, erected in 1593. The Buttermarket House, Dartmouth, and another interior, with an angle lobby doorway from "A house in the West of England" follow. The first really big subject is Montacute House, near Yeovil, one of the great houses of Elizabeth's time, with its garden, pavilions, terrace walls, and "temples," built by Sir Edward Phelips, Speaker of the House of Commons and Master of the Rolls. Four plates are well devoted to this masterpiece, and they include a good sheet of details, besides a ground plan in the text. Lower Walterstone, Dorsetshire, a smaller house near Puddleton, far away from the roar of trains, has some admirable and suggestive points about it, though the whole composition, in the words of the author, may be described as a curious medley. It is undeniably piquant, and the entrance front is a "fetching" piece of work. Longford Castle, in Wiltshire, is better known, with its triangular plan, of which John Thorpe has a copy in his celebrated book of drawings at Sir John Soane's museum in Lincoln's Inn Fields. In execution the house was somewhat altered, and the drawings given by Mr. Gotch, aided by his photograph, display this singular building as it was intended, and also how it actually was executed. Burford Priory, Oxfordshire, is represented by a similar complement of illustrations, though a plan of the chapel to this house, and a large photograph of its western gable would have added greatly to the completeness of the book. As it is, the isolated details of the windows, without the plan and general section, are much lessened in value. The tribune at the entry end of the chapel, too, deserved illustration. In a few years, at the most, the whole fabric must fall into a mass of débris. It is already a ruin. The tombs from Burford and Braybrook churches are worth the space so well devoted to them, and Wroxton Abbey door is shown. The hall and gallery front over it would have been, if anything, more welcome because it is a specimen of fine woodwork. Bolsover Castle, in Derbyshire, is greatly admired by Mr. Gotch, who has devoted much space and energy in illustrating it with two good plans and some sketches of the fireplaces, which are unquestionably remarkable and unusual, like the vaultings in the hall and "Pillar-room." The exterior of the house is ungainly and coarse, particularly the work which Huntingdon Smithson, the architect, put up for Sir William Cavendish about 1629. Barlborough Hall, also in the same county, and erected at the end of the 16th century, concludes the part before us. The plan is of the same type as Bolsover, and may have influenced the design of that house, as Barlborough had already been built 30 years when Bolsover was begun. The four boldly-projecting bay windows, carried up in the form of turrets near the angles of the house, give the building an imposing outline and a character all its own. The quaint angular window at the rear of the house looks better undoubtedly on plan than in elevation, and reminds one of the Tudor-built oriel at Hengrave Hall, Suffolk, the ancient home of the Gages. We can speak warmly of this book, for the plates are well done, and so is the letterpress. The marginal studies are an improvement upon those given before, while the plans are more frequent. The sketches seem somehow a trifle hard and coarse, and wanting in "go." Mr. Batsford is clearly determined to make the work a success, and we think he will do it.

† See BUILDING NEWS, Feb. 27, 1891.

WAYSIDE NOTES.

"WHO shall decide, when doctors disagree?" The "doctors" consulted as to the future of burials and monuments at Westminster Abbey have disagreed. Who shall now decide? Opinions being so exactly divided on the main point—the site of the proposed *campo santo*—we have, practically, a deadlock. It would seem necessary to appoint a further commission to inquire into the report of the present one!

Though lacking in decisiveness, the Report is yet of much interest, and of undoubted value and usefulness. The Commissioners have most carefully sifted every grain of evidence, direct and indirect, bearing upon the subject of their inquiry. If wanting in unanimity, with regard to the proposed building in the rear of the great cloisters, they have yet been one in denouncing spurious schemes, such as that for the erection of chapels to the north of the nave, and that for spoiling the present fine effect of the chapter-house. It is something to be rid of the chance of these latter proposals being carried into effect. An astonishing number of persons seemed ready with plans for this and that; but all, more or less, would have been detrimental to the present old buildings. There can be no two ways of thinking as to the satisfactory nature of the process of selection by which the commissioners reduced the mass of proposals to the two recommended in the report. These we must now consider for ourselves. Opinions may be divided; but I rather fancy that the architectural profession will mainly accord with the Refectory site, not merely because Mr. Waterhouse has recommended this site, but because it seems to recommend itself, on several grounds. Chief among the advantages that occur to one are that it will be in a retired position, where there will be no chance of discord with the Abbey buildings; that it will not interfere with the chapter-house; and that access will be given to old portions of the Abbey without any material alteration of existing features. These are no slight advantages in a matter where the preservation of the old work and the old effect have to be considered before all else.

In the Report the Commissioners allude to the danger from fire that the Abbey suffers from the presence of the buildings fronting Old Palace-yard. If there be real danger, the clearing away of some of the offending tenements would be a good riddance. The laying bare of the external architecture of the chapter-house might also result in some additional effect. This sort of thing, however, is dangerous. Many a building would lose in effect if cleared of the old houses, &c., that crowd in about it, and partially conceal it from view. Certain it is that just at the present time the peep of the Westminster Chapter-house from among the houses and trees of Poet's Corner is charmingly picturesque, where it might be plainly prosaic if it stood naked and bare, as it would do if the block of buildings were cleared away.

When a building stands free, on a level site, and unsurrounded with trees or shrubs, it always reminds me of a model in a glass case. The Natural History Museum, fine as it is, invariably gives me this effect. No trial is so great for any building. Standing alone on a level base, unconcealed in the smallest degree by the ordinary accessories that assist an architectural composition—trees, irregular site, backgrounds, and harmonious neighbouring buildings—every line and detail is open to criticism. Nothing is so hideous as an ill-designed building standing on ground of prairie-like monotony. Site and surroundings go for a very great deal in architecture. What makes the chief glory of the ruin. Not so much the broken angles and softened lines, everywhere apparent, as the trees that partially conceal masses of masonry and the ivy that clings to the walls in rich clusters, climbs the piers, wreaths the columns, and throws its delicate tendrils up slender shafts—dark against light—and into hollow mouldings—light against dark.

If you get more than three hundred and fifty-five letters and two thousand nine hundred and forty-six post-cards—including thin ones—pointing out that "Goth" does not know what he is writing about, or he would not have confounded William Burges, architect, with E. W. Godwin, architect, then I shall consider it incumbent upon me to lessen my contributions to "Wayside Notes." Any fewer, I shall take as meant solely as a kindly correction at the hands of well-intentioned readers. Anyhow, I apologise to all for the slip of the pen occasioned by rather hurried writing of last week's "Notes."

I thought I would have a look at the drawings for a competition wherein one competitor had secured two premiums; so being in the neighbourhood of Islington one day last week, I went to the vestry-hall and examined the plans. It occurred to me that the assessor could not have required much time to pick out the three first designs, however long he may have taken to place them in order of merit. Also, it struck me very forcibly that many competitors thought the sun was going to warm the water in their baths through the glass in the roofs! Others seemed to have a vague notion that some sort of boiler might be required by an odd chance; but "boiler," "stokery," "coals," &c., written on the plans, evidenced, apparently, the whole of the attention bestowed on the matter. Competing architects will never win competitions for public baths unless they go fully and carefully into engineering details of heating, and draw them out on the plans as clearly as did Messrs. Spaulding and Cross in this Islington competition.

The hybrid committee of the House of Commons have thrown out the Metropolis Water Supply Bill, with the inquiry into which they were charged. So also with regard to the London Water Commission Bill of the Corporation, and two minor measures dealing with the water question were not proceeded with. This has the appearance of a very wholesale condemnation of attempts to deal with a much-vexed question. The hybrid committee, however, have taken the best course. Neither of the Bills put before them grasped the subject of London water supply. Something really comprehensive has yet to be produced. Meanwhile, Sir Mathew White Ridley, the chairman of the committee, will issue a special report. This should prove a most interesting and instructive document, tending not a little to show the right way for future endeavours.

The Central London Railway Bill has been more fortunate than others of a similar kind that have lately been before Parliament. It has passed through the Committee of the House of Lords, and, all well, seems destined to ultimately lead to the construction of the proposed line.

Some time ago I alluded to the Public Health (London) Bill as probably about to become law. I mentioned it then as emanating from the County Council, and containing a good deal of "grandmotherly" legislation. This Bill has now passed, and we shall await with interest its result on the public health. It was well overhauled in Parliament, and some new clauses added. If details in the matter of sanitary supervision could insure hygienic perfection, this new measure should bring about a most desirable state of things.

In *A.A. Notes* for July, Mr. F. M. Simpson, writing on "Impressionism in Architecture," says that the architectural work of the present day may be divided under three heads:—(1) Architectural work that is not architectural at all; (2) that is archæological architecture; (3) that is impressionist or progressive architecture. This is stating the matter pretty clearly, but the writer scarcely uses the term "impressionist" in its proper sense, either in this classification, or throughout the whole article. Nevertheless, it is brightly written, and helps to make the present number of the *Notes* interesting and readable. Whether the progressive architecture of to-day is rightly or wrongly termed "impressionist," Mr. Simpson is correct in the deductions he makes, save for some few details that may after all be merely matters of taste.

Mr. E. L. Garbett is as emphatic about the payment of architects by commission as ever. In a short but interesting communication to this week's *English Mechanic* on the ventilation of large buildings, he invites co-operation in the adoption of a wonderful ventilating exit he has invented, as follows:—"The first brickmaker in any county who likes to make the forms C, D, E, F, in patent 46 of 1884, may have the monopoly in that county if he applies to me, 26, Claremont-square, N.; but he must keep clear of the Devil's architects. Colonel North made a huge mistake in the fancy he was 'dealing with a gentleman.' He should have known, as Lord Chief Justice Kenyon announced a century ago, designing for a 'per-centage on the outlay' is no gentleman's idea, but a highwayman's, or, in short, Satan, the Devil's, idea. Long ere Colonel North's building, or any around, has done half the mischief it has to do, he will be a bit wiser." GOTH.

COMPETITIONS.

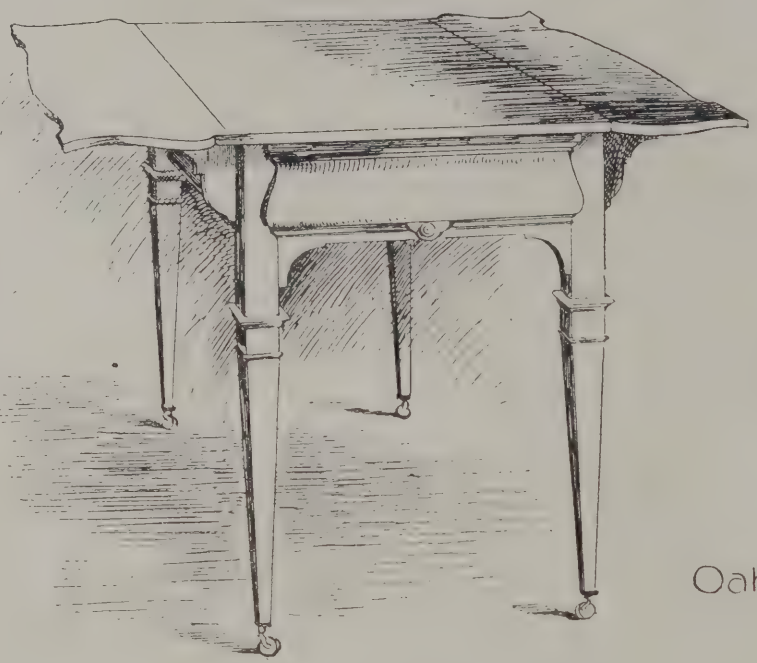
KENDAL.—On Monday in last week the committee decided as to the plans to be adopted for new Sunday-schools, Zion Chapel, Kendal. Six sets of designs were sent in under motto, each possessing undoubted merit. A committee of men considered to be the most practical in the congregation was appointed to examine the plans minutely, and after three prolonged sittings, occupying many hours, they ultimately decided by four to two that the design sent in under motto "Light and Air" should be placed first in order of merit, and that it should be recommended for adoption, the design under motto "Be his the palm who merits it" receiving two votes. This was subject, however, to a further decision of another committee consisting of 24 members, who, after a short deliberation, reversed by ten votes to seven the decision of the committee whom they had appointed to adjudicate upon the plans, and upsetting in a fractional part of the time the laborious work of the first committee. The general plan was very much similar in both designs, the ground floor being left for a school-room without obstruction; the first floor being divided into class-rooms on three sides, with open space in centre. One of the conditions was that the school-room should be lofty and well lighted. The premiated design shows this school-room 8ft. 6in. high. The design placed second shows the school-room 12ft. high. The school-room averages about 54ft. by 47ft. inside. The design bearing the motto "Be his the palm who merits it" is by Mr. Stephen Shaw, F.R.I.B.A., who will carry out the building. The design awarded second prize, and bearing the motto "Light and Airy," is by Mr. John Stalker, M.S.A., who received ten guineas. Both architects are practising in Kendal.

CHIPS.

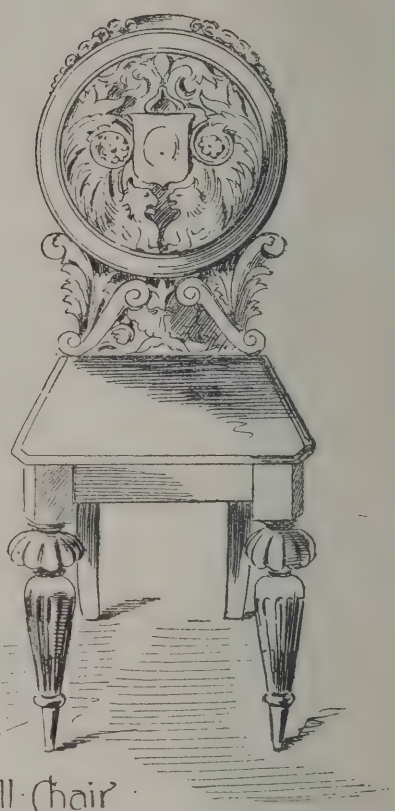
The foundation-stone of a new church, to be dedicated to St. Peter, was laid at Bentley, near Doncaster, on Monday, by Lady Mary Cooke. The church will be in the Early Decorated style. It will consist of nave and chancel, with north and south arcade. There will be porches on the north side and at the south-west angle; and from the latter will spring a tower and spire, rising to a height of 130ft. The church will accommodate 400 hearers. The interior fittings will be of teak. The cost, exclusive of site, will be between £6,000 and £7,000.

The death is announced of Mr. Robert Roberts, of Lowry Bank, Seacombe, a gentleman who has been a prominent figure among the Welshmen in Liverpool for several years. Mr. Roberts, who was a native of Carnarvonshire, was in business in Liverpool as a general contractor. He was also an owner of a considerable amount of property, and had an estate at Colwyn Bay. The deceased, who was 52 years of age, leaves a widow and one son.

Two pictures of the Sienese School have been added to the National Gallery. That numbered 1330, and named "The Transfiguration," by Duccio de Buoninsignia, *c.* 1263, is a piece of six figures, including our Saviour and five disciples, on a gold background. No. 1331, "The Virgin and Child surrounded by Cherubim," is by Bernardino Fungai, born *c.* 1460, died 1516.



The new Board Schools, Carlisle, are being warmed and ventilated throughout by means of Shorland's patent warm-air ventilating Manchester grates and stoves, the same being supplied by Mr. E. H. Shorland, of Manchester.



At Tuesday's meeting of the London County Council, the recommendation of a committee that Mr. Walter Emden's plans for a new theatre on the site of Waterloo House should be approved was rejected, and the superintending architect to the Council, Mr. T. Blashill, was instructed to report on the objections to the site of the proposed theatre.

LINCOLN COLLEGE, OXFORD.

Lincoln College was originally founded, in 1427, by Richard Flemmynge, Bishop of Lincoln. Like several other colleges at Oxford, the new society was at first settled in an ancient hall, which was bought for the purpose, and it was not till after some years that it had any buildings specially designed for its accommodation. The founder died in 1430-1, leaving his new college insufficiently provided for, and still inhabiting Deep Hall. The first considerable benefactor was John Forest, Dean of Wells and Prebendary of Banbury, who, in the year 1436, besides adding to their endowments, built the Hall or refectory, together with the kitchen, the buttery, and the chamber over it. He also built an oratory or small chapel on the north side of the original quadrangle, using for that purpose the materials of the old church of St. Mildred, which was taken down in the year above-mentioned. This oratory was converted into a library when the present chapel was built, in 1631, on a new site; but the original hall, kitchen, and offices remain to the present day. The Hall, however, was very extensively modernised in 1701, at the expense of Nathaniel, Lord Crewe, and others, when the walls were lined with plain Classic wainscoting, the old oak roof was concealed by a coved plaster ceiling, and the window traceries were at the same time cut out, and the openings filled with plain sashes. A more justifiable innovation was the introduction of a fireplace which blocked one of the ancient windows. The hall is now being gradually brought back, under the direction of Mr. T. G. Jackson, to its original character. The plaster ceiling has been removed, and the fine old open-timber roof of 1436 repaired and restored to view, and strengthened by iron ties and plates. Behind the modern panelling was found, during the erection of Mr. Jackson's new buildings some years ago, the tracery of the old window blocked by the fireplace; and from this, aided by the old engravings in Loggan's book, the original design of the windows has been recovered and is now being reproduced. As soon as funds will allow, it is intended to line the walls with new wainscoting of oak, suitable in style to the character of the original architecture. Like all Mediæval halls, collegiate or domestic, that of Lincoln College, built in 1436, was originally warmed by a brazier in the middle of the floor, from which the smoke escaped through an open lantern in the roof. At Lincoln the lantern still remains perfect, though no longer open to the hall below. A fireplace was formed, probably when the hall was panelled in 1701, in one of the old window recesses. The chimneypiece of that day, a very modest affair, is now to be replaced by that shown in the accompanying sketch, as part of the restoration of the hall under Mr. T. G. Jackson's direction. The new chimneypiece will be of Portland stone, and will bear the arms of the College in the centre, and those of Dean Forest and Lord Crewe in the spandrels of the hood. Above will be exposed the head of the original window, hitherto concealed behind Lord Crewe's panelling, from which the exact form of the original window traceries has been recovered, and by which the rest of the windows, now filled with plain wooden sashes, are about to be restored, as was shown in the previous illustration from the Royal Academy of the hall, published in our issue of June 12, 1891.

SELECTED DESIGN FOR THE BLACKPOOL EIFFEL TOWER.

This design, by Messrs. Maxwell and Tuke, Manchester, has been chosen in the late competition, and the new buildings are to be erected upon a plot of land containing about 6,000 square yards, bounded on the westerly side by the central beach and on the other sides by Bank Hey-street, the principal street approaching the town from the central station, by Victoria-street, and by a narrow street on the south side. The position is the most central in Blackpool, being midway between the north and south piers, and with 150 yards of the central station. The plan of the new building will be almost rectangular in form, with a tower 100ft. square in the centre. The base of this is to be used as a circus, with four entrances from the central beach and Bank Hey-street, besides performers' and horse entrances from the narrow street. On the right and left of the circus are large arcades for the sale of toys, jewellery, and other fancy articles. Each arcade will have six entrances, three being from the central beach and three from Bank Hey-street. The space between these important thoroughfares will be traversed by eight broad passages. The outside portion of the ground floor facing the three principal streets will be devoted to shops. The first floor will be occupied by the circus gallery, and the remainder of the floor by the menagerie and aquarium, which will be reinstated on this floor by an attractive wax-work exhibition, and by popular exhibitions of varied kinds either permanent or annual. The second floor will be a spacious promenade concert-room and floral hall, with an area of nearly 30,000 square feet, with two stories of open-air balconies and cafés facing the sea. The Eiffel Tower, between 400ft. and 500ft. high, will stand in the centre of the plot. It will be 100ft. square at the base, and will be reduced to 30ft. square at the foot of the cupola. The first or grand gallery, 70ft. above the level of the ground, will consist of an inclosure 80ft. square, with an open balcony surrounding it 18ft. wide, and at this level the lifts from the ground floor will terminate and the central lifts to the summit will commence. This inclosed hall will be fitted with shops for the sale of refreshments, confectionery, photographs, and other fancy articles, and with cafés raised several feet above the level of the gallery outside. The second gallery, 300ft. above the level of the ground, will comprise an inclosed hall 30ft. square, where the lifts will terminate, and in order to accommodate the crowd of visitors expected to be conveyed by the lifts, there will be five open galleries above this, containing about 27ft. square in each, and one open gallery 36ft. square with a double staircase so arranged that the visitors can only pass in one direction. By these means the directors hope to accommodate as many as 20,000 passengers in one day, which is a very important consideration in a place like Blackpool, where as many as half a million visitors are registered as visiting the town in one week. The lantern and cupola, in which it is intended to place an electric search light, will rise about 50ft. above the uppermost gallery, and will be approached by a narrow circular staircase. The means of access to the upper floors of the building and to the tower will be very commodious. For persons desirous of ascending the lifts, the large central hall, with entrances from the beach, will be arranged on the ground-floor, with a service of hydraulic lifts to carry visitors to the first or second floors of the building, or to the great gallery in the tower, 70ft. above the level of the ground. If visitors desire to go higher than this they must be transferred into one of the central lifts, travelling from this to the second gallery, 300ft. higher, whence they can ascend still higher by means of ample stairs to any of the six galleries over head, of which mention has already been made. In addition to the above mentioned lifts, ample provision is made for staircases leading to the different floors and to the summit of the tower. The first and second floors will be served with three staircases, each 10ft. wide, and four staircases each 5ft. wide. The broader staircases will stop at the level of the promenade concert-room, but the four narrower stairs will be carried to the level of the great 70ft. gallery. When the buildings are being cleared of visitors, these stairs will be equivalent to a staircase 50ft. wide, which would enable 35 persons to march out abreast. It is intended to construct the tower of wrought-iron and steel, but in order to make the fullest provision against the contingency of fire, the 16 great legs will be formed with square iron lattice pillars, filled and clothed with Portland cement concrete of a decorative character, with the light iron lattice work showing between. Besides giving great security in the event of fire, the additional weight of the concrete legs will afford immense stability against wind pressure, which is a power to be carefully considered in Blackpool. The materials intended to be used for the fronts are red brickwork, with terracotta dressings of a somewhat elaborate character. The buildings will be lighted throughout by electricity, which will be produced by machinery in the basement. The cost of the buildings is estimated at £120,000.

NEW PREMISES IN WIGMORE-STREET.

The whole of the front of this building is in terracotta supplied by Doulton, the modelling is by Walter Smith. Messrs. Mark Patrick and Son were the builders, Mr. T. E. Collcutt is the architect.

KIDDERPORE ESTATE, HAMPSTEAD.

The recent census returns show that no part of the metropolis has grown at a more rapid rate than its north-western suburbs, and it is not necessary to seek far for the cause of what may be called an almost abnormal growth. Hampstead is one of the few districts in London which, close to the doors of our enormous population, yet contains in itself all the qualities of a health resort. Its soil, its great elevation above the sea level (or, better still for Londoners, above fog level), its famous Heath, and its accessibility by rail and road, combine to mark it both as the residential suburb for the well-to-do classes and the holiday resort of the masses. Little wonder, therefore, that in the last two decades its salubrity has gained for it a larger increase of population than that of any other suburb of London. The considerable development of building operations in Hampstead has, of course, involved the removal of many of its fine old houses and the absorption of their spacious pleasure-grounds which, a generation or two ago, occupied its best positions. Among those mansions, one of the most prominent was Kidderpore Hall, so named by its owner and builder, a retired Anglo-Indian, who in the flourishing days of "John Company" made his fortune at Kidderpore, and associated its name with that of the "lordly pleasure house" which was destined, for many years, to be one of the best-known landmarks on the high ground in the north-west of London. The march of events has converted Kidderpore Hall and its grounds into a building estate; but the owners have dealt gently with the "genius loci," and not even the Society for the Preservation of Ancient Buildings could have more jealously guarded the interesting old house, or have preserved with greater care its beautiful old trees and shrubberies: even its old name has been adapted to the new condition of things. The mansion, with an extensive additional wing, containing lecture-rooms and classrooms, and all the adjuncts of a modern high-class ladies' college, is still intact on the Hampstead heights, and under its new name of "Westfield College" is budding into new life in an old neighbouhood full of historical recollections and associations. The old meadows have become a new building estate, which is destined to be, in the near future, an important addition to Hampstead, to follow, and perhaps surpass, the great success of Fitzjohn's-avenue and its surroundings, which have created a field for a much advanced style of domestic architecture with a special character of its own. The estate stretches northwards towards the Heath from the Finchley-road, to which it has a frontage of more than 1,000ft., and, rising

gradually to an elevation of upwards of 250ft. above Ordnance Datum, it is of such height that Windsor Castle on the one side, and the Crystal Palace on the other side, appear to lie in a hollow at its feet. It is closely adjacent to three railway stations, and to the principal omnibus termini, and is further enlivened by the numerous stage coaches now using, daily, the main road from London. The new roads which have been constructed on the estate appear to have been laid out with great care, so as to avoid serious gradients and all interference with the beautiful old trees and foliage. The satisfactory method of development, and the skill with which the first few houses on the estate have been designed, induce us to give this week a double-page illustration of the "Kidderpore Estate," and also a plan of one floor and a perspective view of one of the first houses in course of erection at the junction of the two most important roads. Later on we propose to give views of some of the other houses. The architects, from whose designs the whole of the works have hitherto been executed, are Messrs. Davis and Emanuel, of 2, Finsbury Circus, and the management and further development of the estate are in their hands. We are asked to state that the freeholds of the lots are for sale, free from all restrictions, except such as are of mutual benefit to the purchasers, and that all sewers and branches for house connections are formed and water laid on.

NEW SOUTH TRANSEPT, ST. BARTHOLOMEW THE GREAT, E.C.

THE original south transept of St. Bartholomew the Great was destroyed by fire, like so many other parts of the church, about the year 1825. The walls remained standing for a few years, and were then taken down, and a brick wall built across the opening to keep out the weather. The space above the level of the triforium floor was filled in with a canvas vestry. This brick wall and its cement windows having become insecure, it was decided last year to rebuild it; the canvas vestry was therefore removed, and the present transept shown in the view has been built. The transept has only been carried out one bay to the southward instead of the full original depth, partly on account of the adjoining lights, and partly on account of the natural desire not to increase the area of a fabric the maintenance of which is already a heavy burden on a poor parish. No old work whatever has been interfered with by this transept, and a good deal of interesting Norman work has been brought to light. The new work has been built in the style of the clerestory of the choir, and an endeavour has been made at the same time to preserve the massive character of the earlier work. The remainder of the site of this old transept has been laid out and planted, to the great improvement of the neighbourhood. The new work has been faced externally with flints and Portland stone dressings, and internally with plain Bath, the colour of which harmonises well with the quiet tone of the interior of the church. The work has been well and carefully carried out by Messrs. Dove Bros., of Islington, Mr. Gregory being the foreman.—A. W.

CHIMNEYPIECE BY BENEDETTO DA ROVEZZANO, FLORENCE.

THIS masterpiece is the celebrated Borgherini fireplace sculptured by Benedetto da Rovezzano for Pier Francesco, and, like his greatest work done in 1506—viz., the reliefs from the demolished tomb of St. Giovanni Gaulberto, a saint of the Vallombrosian order, brought from the monastery of St. Salvi—is now located in the Bargello at Florence. It stands at present in the new gallery next the room on the opposite side of the courtyard, where the great Della Robbia bas-reliefs, intended for the cathedral organ, are arranged. The photograph which we have reproduced shows the exquisite detail of this chimneypiece by Rovezzano, who, it will be remembered, figured conspicuously among the architect-sculptors of the Renaissance. He was a pupil of Donato Benti, whom he assisted in carving the fine marble gallery for the organ-loft in San Stefano at Genoa in 1499, and also in sculpturing a tomb at the commission of the King of France in 1502. Rovezzano came from Pistoja, and his work was chiefly of an architectural character, such as beautiful portals full of graceful foliage, as at the house of Oddo Altoviti; and charming friezes, capitals, and columns, as in the exquisite fireplace which he made for the Borgherini family. The distinguishing marks of Benedetto's designs are classic grace and extreme finish. His marbles are so polished that the surface is soft as satin. This is a singular quality of the Florentine school of the second half of the 15th century which they shared with the ancient Greeks. Wax was used to obtain the "circumlitio" or finished surface, such as Nicias obtained for the works of Praxiteles, or like the lustre seen in the works of Mino of Fiesole, the Majani, Desiderio of Settignano, as well as the examples left us by Rovezzano. This master of the sculptor's art was most successful as a tomb maker. His monument to Piero Soderini in the Church of the Carmine at Florence and the tomb of Oddo Altoviti in the same church are very good specimens of his style. Rovezzano lived in England for five years, and carved a monument for Cardinal Wolsey in 1524. This worthy's disgrace caused the demolition of the work. The bronzed parts were fused by order of Parliament in 1646, and the marble sarcophagus served ultimately for Lord Nelson's monument in St. Paul's Cathedral. Thus this great Italian sculptor's noble work was brought to our own doors, and no doubt he influenced for good much of the contemporary work in this country.

WORKING BOYS' HOME, DUBLIN.

THE Working Boys' Home and Harding Technical School, which have their present house in Denzell-street, are now erecting new premises in Lord Edward-street, Dublin, the new street leading direct from Dame-street and Cork-hill to Christ's Cathedral, lately so splendidly restored by Mr. Henry Roe. The site is on the north of the street running from the west corner next the cathedral, 162ft. down street. The charity is supported partly by money left to it, and partly by subscription, and is a most useful one, supplying, as it does, a home for boys, with both education for mind and body, at a cheap rate, and enabling them to serve their time at a trade, and live in Dublin comfortably and respectably, and not exposed to the temptations that youth is liable to fall into. The building is of brick faced with Dennis Ruabon red brick and buff terracotta, and contains on the ground floor entrance porch and hall, dining-hall, kitchen pantries, and also superintendent's office, lavatories, &c., and over two libraries, recreation-room, and large lecture-hall, with platform, &c., for entertainments. On this floor the superintendent has his private apartments, and over this is sleeping accommodation for about 75 boys, with all necessary sanitary arrangements, baths, &c. On ground floor there is also a good space at rear, to be used as a recreation ground and gymnasium. The contractors are Messrs. H. and J. Martin, of Belfast, and the whole is from the design and under the superintendence of Mr. Albert E. Murray, F.R.I.B.A., architect, 37, Dawson-street, Dublin.

FURNITURE AND CARVING AT THE CARPENTERS' HALL.

WE give this week a few sketches from the exhibition recently held by the Carpenters' Company at their hall in Throgmorton-avenue. For the Table, Mr. Jacob obtained a silver medal. It is made of mahogany, and has two flaps, and it is fitted with a good, useful drawer. For the oak Hall Chair, Mr. G. W. Redmond is answerable. The carving is well designed, and in the circular back is nicely arranged to fill its position. The Entablature Panel is a spirited piece of carving, the dolphins and aquatic birds are quite after the manner of the Italian Renaissance. The Frieze Panel, which took a first prize and bronze medal, is noticeable for its vigorous design and strikingly bold execution, the deep shadows obtained rendering it very effective.

The next annual meeting of the Cambrian Archæological Association will be held at Killarney during the second week in August, by invitation of the Royal Society of Antiquaries of Ireland. The president elect is Professor Rhys.

New premises for the Bank of Ireland have just been opened at Sligo. The building is three stories in height, and situate close to the Victoria Bridge. The facing materials are limestone, with Mount-Charles stone dressings, and the character is Ionic. The contractors were Messrs. Clarence and Son, Ballisodare, the whole being carried out from the plans, and under the supervision of, Messrs. Millar and Symes, 186, Brunswick-street, Dublin, architects to the Bank of Ireland.

HYDRAULIC CONCRETE.

POZZUOLANA, a volcanic production found in Italy, has the property of imparting hydraulic qualities to rich limes. In marine constructions in Italy, and on the shores of the Mediterranean, this concrete has been found to give the best results, and to set quite hard. The pozzuolana concrete is simply thrown into the sea from baskets, and confined between boarding to the shape of the wall. The new basin constructed at Pola by the Austrian Government is formed in a like manner, between rows of piles, and this concrete has been used on a larger scale in the great mole which protects the Port of Algiers. The blocks of béton of immense size were moulded in wooden boxes, after which the boxes were removed, and the blocks launched into the sea to find their own level. Some of the blocks were formed *in situ*, and were composed of one part of rich lime, two parts of pozzuolana, and four parts of broken stone. The blocks set sufficiently hard in 24 hours to resist the shocks of heavy seas. Great care in the use of the proper proportions, and in the manipulation of the ingredients, is necessary in hydraulic-concrete structures.

STRENGTH OF CEMENT.

A VERY valuable summary has been compiled and published in Mr. W. G. Kirkaldy's "Strength and Properties of Materials" to show the range in the strength of cement. The range in quality varies much. The tests show the resistance to pulling stress of various samples of cement, all tested neat, and age 10 days. The highest stress per square inch is 643·4lb. for a cement weighing per bushel 115lb.—the lowest recorded is 87lb. per square inch. Between these extremes we have no less than 178 tests of gradually increasing figures. The 20 days' samples vary from 534·8lb. to 203·2lb., the 30 days' samples from 675·2lb. to 378·6lb., and the 100 days' samples, of which there are only two, are 573·6lb. and 568lb. The value of this table is that the stress results are clearly printed in large type, and all the specimens were prepared on one system—ten specimens to each set. The briquette used had 5sq.in. area. Engineers and architects might usefully consult this table before specifying the required strength of cement—a subject which admits of a variety of conditions and of much misapprehension.

BOOKS RECEIVED.

Water-Supply: a Handbook for General Use, by JOSEPH PARRY, M.Inst.C.E., Water Engineer, Liverpool, new edition (London: George Philip and Son), is an elementary manual on water as an agent in sanitary progress. Its composition and purity, safe sources of supply, purification, domestic filtration of water, the water companies, distribution of water, pipes and fittings, cisterns, rural supplies are matters that are briefly treated. Mr. Parry has made his little handbook a useful one for the householder as well as the general reader; and we think it might be usefully introduced as a text-book in our schools, public as well as private, as the subject of water-supply, its purity and domestic use and storage, are questions that more deeply concern the welfare, sanitary and moral, of the public and youth of both sexes than the elementary properties of matter and the principles of light, heat, or electricity. A sketch is given of the first legislative measures on the subject, the Health of Towns Commission of 1844, the first general Act of 1847, the Public Health Act, 1848, the Public Health (Water) Act, 1878, and other statutory powers, and some valuable statistics and reports are given; also, good summary of the composition and analysis of water, the action of the Legislature in regard to raising the standard of purity, the softening processes, and the influence of supply on the mortality. The results of the microscopical report of Dr. Hassall are given. The most practically useful part of this little treatise describes the forms of house filters, water cisterns, &c., and points out the defective arrangement of cistern and overflow pipe by which the latter becomes a communication between the sewer and the water cistern; and the danger of allowing closets to be supplied from cisterns which supply the drinking water. The desirable points to consider in water closets are noticed, and the mechanism of ball traps, regulating cisterns, taps, and other fittings are

noticed. A variety of other information that every householder should possess in connection with water supply and fittings will be found in Mr. Parry's useful manual.——*Sciography, or Parallel and Radial Projection of Shadows*, by ROBERT PRATT, head master of Science and Art, Barrow-in-Furness. (London: Chapman and Hall, Limited). While we have numerous treatises on practical geometry, solid geometry, perspective, &c., the subject of the projection of shadows is rarely or very imperfectly treated. Mr. Pratt's well-printed and illustrated work supplies a series of graduated exercises, which will be found of essential value to architectural and engineering students. Our own articles on the subject were prompted by a desire to supply a series of problems of use to the draughtsman. Mr. Pratt's exercises are clear and brief. The orthographic projection of the rays in parallel lines at an angle of 45° has been followed, by which system the depth or width of the shadow projected becomes a measure of the projection of the feature. The first plate of diagrams illustrates lines and plane figures, the rays of light parallel and inclined at 45° to the intersection line or X Y in plan and elevation. These explain the principle of projection as far as regards vertical and horizontal planes; next we have the mode of the projection of rays on an inclined plane and on two oblique planes forming a stepped embankment; lastly, of curved surfaces. The regular solids are next dealt with in a series of clear problems; then follow solid figures of various shapes, also the principles of architectural shadowing as applied to columns—square, round, and fluted. The illustrations given of the art as applied to engineering objects and machinery are of value, and there is little doubt that complicated machinery and details receive considerable aid, and are made more intelligible by, a correct drawing of shadows. We may refer to the beautiful shaded wood engravings of machinery which weekly appear in the engineering journals, as showing to what degree of accuracy the art of shading has been brought; how the shadow cast on the different surfaces of cylinders and rods explain their form and prevent the inevitable confusion of lines that would occur if the shadows were omitted or inaccurately represented. Many of those shadows are not perhaps geometrically projected by rule, but the draughtsman has, by a course of study, such as is afforded by this treatise, mastered the effects of intersection on different forms and positions of surfaces, and can, with the exercise of an artistic eye, introduce his shadow with sufficient truthfulness and effect, as to give value to his drawing. The architectural draughtsman has greater need of combining both knowledge of the art with artistic taste, but how few drawings and perspectives we see are shaded with anything like accuracy. We have seen such absurd shadows cast by towers, chimney-stacks on roofs and walls, that they have entirely spoiled an otherwise well-drawn perspective. The problems given in Mr. Pratt's book will, if carefully studied, prevent the glaring mistakes so often met with in pen and ink and shaded colour drawings of buildings. These exercises will explain how the shadow of a column appears when projected on mouldings. The example given of this problem might have been improved, and a few selected details of architectural work would have been desirable. The truss, Gothic arcade, &c., are poor, though they illustrate the principle. We have also illustrations of radial projection, in which the source of light is a point, or two points; these look rather more complicated in the lines required, but are soon mastered when geometrically understood. The parallel and radial examples of projected shadows might have included a few more architectural treatments. The perspective projection of shadows includes examples of the shadows projected by a gateway on the ground and sloping bank; a chimney-stack shadow on sloping roof, interior shadows cast on walls and ceilings. These projections, of course, involve a thorough knowledge of perspective, and are very necessary to the architectural draughtsman. Reflections are next treated on plane and cylindrical surfaces, the diagrams illustrating which are somewhat complicated by lines. Mr. Pratt's treatise is well adapted for students and candidates preparing for the examinations of the Science and Art Department, both in sciography and third-grade perspective. The examination papers of the Department have been freely used to this end.—*Sketches of Village Buildings:* from Designs by JAS. WILLIAMS, Architect, with Notes (London: Richard Bentley and Son, New Burlington-street), is a small, oblong volume of letterpress and ink photos from monochrome sketches of village buildings, designed with much feeling and characteristic simplicity. They have all the effect and breadth of sepia sketches. Plates 1, 2, and 3 are very appropriate. The vicarage and grouped cottages in twos and threes are plain English-looking 17th-century structures, free from all modern cant and fussiness, the high-pitched tile roofs, with gabled ends, having simple barge-boards projecting, and a little variety introduced by filling in one of the gable fronts with half-timber work, and projecting over wooden brackets the upper story. The chimneys are large, plain, and high, grouping well with the outlines. Only one stone treatment is shown, No. 4, which is a trifle out in its perspective, and this fault is apparent in some other sketches—10, 21, 22. Here and there a tiled gabled end is seen. The old-fashioned mullioned casement, plain or projecting on a corbelling or on brackets, is introduced in most of the cottages; and the sketches of interiors, as Nos. 5, 16, 21, with their large fireplace openings and carved mantel, panelled walls, and bay windows with seats round them, are pleasing. The author has an artist's eye for grouping; he loves to give us the panelled wall and ceiling, and carved chimney-piece, with its old-fashioned dog grates, and it is this old picturesque character he would revive. And for the country districts this style is natural and appropriate—such, for example, as we find in Kent and Surrey,—infinitely more pleasing than the plain, box-like rooms with ordinary window-sashes, with bare, plastered walls and ceilings. Mr. Williams conjures up from the imagination, the features of a country home; as he says, an "old-fashioned inn," with all its faults, is always "attractive and interesting"; so, too, the old-fashioned corner and ingle nook was a veritable haven of rest in the long dark evenings of the winter. The notes on materials for walls are suggestive. He speaks of "harling or roughcast," which can be coloured as a good surface, when bricks or stone cannot be obtained. When done in lias lime or cement mixed with shingle, the surface is weatherproof, and more pleasing than ordinary cement work. The red hanging tilework is always a characteristic kind of weathering for walls in the country, but the modern "Queen Anne" and Gothic crazes have destroyed the simplicity of their old use, and made them merely ornamental features. It is a pity Mr. Williams did not give a few sketch plans to accompany the perspective sketches. "A Small Village Church" (14) is a little out of drawing, but quaint. We do not understand its plan, which ought to be a plain parallelogram broken by a side or end tower. The form of that given on plate 22 is also rather vague, and the projection seen behind looks rather like a single transept arrangement. We are more pleased with the domestic work, the cottage residences, almshouses, village shops, and village inn and shops; they are at least more homely and country-like than many of the over-timbered and elaborate designs now seen in country roads and lanes.

THE LONDON CARPENTERS' LOCK-OUT.

THE struggle between the London carpenters and the Central Association of Master Builders threatens to assume still greater dimensions, as the men have decided to call all the men out of the biggest of the shops, which so far have been unaffected by the dispute, as the masters refused to concede on Wednesday the 47 hours week and the 10d. an hour demanded, on the ground that the letter of the joint committee contained a threat. Neither side shows signs of wavering, for while the master builders declare they are benefiting by exemption from time penalties, funds are coming in to the aid of the men more rapidly each week. There are signs that the long continuance of the struggle is beginning to affect the temper of some of the men compulsorily unemployed. Hitherto we have been pleased to note the quietness with which the dispute has been conducted, and much regret to see that on Monday Charles Miller and Hugh Underwood, carpenters on strike, were, at the Westminster Police-court, sent to prison with hard labour for three weeks, for following and using threatening language to Andrew Robertson and John Balls, foremen in the employ of Messrs. Mowlem and Co., of Grosvenor Wharf; while at the Southwark Police-court on the same day, James Forsyth, a carpenter, was ordered to be imprisoned for fourteen days for assaulting another carpenter, with intent to prevent him from following his employment during the present strike.

Two meetings of the carpenters and joiners of London and the suburbs were held on Sunday afternoon. The principal gathering was at Finsbury-park, where Mr. E. Taylor presided. Mr. L. Burr moved, "That this mass meeting of building operatives expresses its sympathy with the carpenters and joiners on strike in their endeavour to obtain the eight hours' day, and promises to support them morally and financially." The resolution was carried. Mr. W. Hepworth, a delegate to the general committee, moved, "That in the opinion of this meeting of carpenters and joiners the time has arrived when we should take more drastic measures to bring about a settlement of our present dispute in the building trade, and if our employers do not meet our committee during the present week to arrange for a settlement of the strike and lock-out, that the central committee be requested to strike all shops and jobs where the terms of the memorial have not been conceded on Monday, July 6." Mr. J. Yallop seconded. Mr. J. Mackie (chairman of the Building Trades Committee) asked the meeting not to vote for the resolution, and at first refused to put it to the meeting; but, after a scene of great confusion, ultimately did so, when it was lost by an overwhelming majority, only fifty hands being held up in its favour.—At Victoria Park, where a similar meeting was held, a resolution of sympathy with the men was carried.

A meeting of the carpenters and joiners of Edinburgh and Leith was held on Friday evening in St. Mary's-street Hall, Edinburgh, at which Mr. Mackie, London delegate from the United Trade Committee of Carpenters and Joiners, gave an account of the movement for a reduction of hours and an advance of wages among the carpenters and joiners of the metropolis. A resolution was unanimously adopted, pledging the meeting to do everything in their power to support their brethren in London both morally and financially. Treasurers were appointed for the Edinburgh and Leith districts to receive subscriptions.

CHIPS.

The erection of the proposed new church at Sutton, in the parish of St. Helen's, has been commenced. The structure, without tower, is estimated to cost about £7,000.

The Penketh (Warrington) Wesleyan Chapel is being enlarged and redecorated. The enlargement will give sitting accommodation for 100 more persons, and the cost is estimated at a little over £1,000.

The designs of Mr. G. S. Packer, a local architect, have been accepted for the new temperance hall for Southport, the erection of which will shortly be commenced. The new hall, to seat 700 persons, is to be commenced with the present hall, this being first raised, and the elevation decorated.

New schools at Lower Gornal, Sedgley, were opened on Tuesday. The building accommodates 280 scholars and cost £2,800. The buildings are of red brick, with Gornal stone dressings, and the interior woodwork, with desks and tables, are of pitch-pine. Mr. Brevitt (Wolverhampton) was the architect, and Mr. H. Gough, of Sedgley, the contractor.

At a meeting of the Kenwyn Church Council on Tuesday week, plans for a new vestry on the north side of the church near the tower (submitted by Messrs. Henderson and Son) were approved. The cost is estimated at £100.

The American Screw Co., of Providence, Rhode Island, are about to establish branch works at Leeds, on the site of the old Perseverance Ironworks in Kirkstall-row. The factory to be erected is the design of Mr. Charles D. Rogers, of Providence; but the plans have been brought into conformity with the building by-laws of the borough by Mr. Thomas Ambler, architect, Park-place. The structure now to be raised is only one-half of what it is ultimately intended to erect. Meanwhile it is proposed to cover the frontage to Kirkstall-road to the extent of 100ft., and to carry the building back for 344ft., with a width (over the greater part of the latter) of 80ft. When the time for extension arrives, a duplicate of this building will be erected, and the two buildings running backwards from the road will then be separated by a yard 40ft. in width. The structure is to be of a plain character.

Building Intelligence.

BLACKHEATH.—St. Mary's Catholic Church Cresswell Park, Blackheath, which is now completed, was opened by the Bishop of Southwark on the 1st July, and consists of nave, chancel, Lady-chapel, chapel of the Sacred Heart, organ-chamber, two sacristries, and baptistery. On the right of the west or principal entrance, to the left of the nave gable, and facing approach, stands a small but proportionate tower and octagonal spire, with a clock and chiming arrangement. The church will accommodate about 500 persons. The whole of the floors are in Duffy's wood-block paving. The carving of the church was admirably executed by Mr. D. N. Smith, of Clapham, in keeping with the 14th-century style of Gothic architecture. The nave, from the finished floor-level to apex, is 50ft. in height, and is formed with open principals in pitch-pine, relieved in large panels with plaster. No pains or expense have been spared to render the roofs impervious to heat and cold. The cost of the church, as contracted for and so ably carried out by Messrs. Smith and Sons, builders, of Norwood, was £4,147, under the supervision of Mr. C. Healy, the clerk of works, from the designs and working drawings of Mr. Alfred E. Purdie, architect, of Talbot House, Crownhill-road, Willesden Junction.

CORSTORPHINE.—On June 25 the foundation-stone was laid of a public hall at Corstorphine. The plans, prepared by Mr. J. Robart Pearson, architect, Edinburgh, show a well-lighted, airy hall, with a dome-shaped recess or platform, capable of accommodating 460 people. The ceiling is partly circular and partly octagonal, divided into five bays by means of moulded plaster ribs. Behind the hall are two retiring-rooms, and above these a caretaker's house. The dressings are of red stone, and the walls of natural faced blue Hailes stone. The total cost will be from £1,400 to £1,500.

GUILDFORD.—The new Conservative club will be opened on Wednesday. The assembly-hall is 24ft. by 62ft., and is 13ft. high. Over the hall are the two billiard-rooms. The principal room is 41ft. by 24ft. There will be two entrances to the premises, one from Chertsey-street, and another from North-street. Mr. A. J. Sturges is the architect, whilst the contractors are Messrs. Smith and Sons.

LONDON HOSPITAL.—The Duke of Cambridge last week opened the new buildings which have just been added to the London Hospital. The additions made begin with a fine portico entrance from the street, through which the main hall of the building is reached. On the right side are the waiting and receiving rooms, rooms for the examination of both male and female patients, and some rooms for the nurses. On the left side the chief apartment is the students' day-room. On the first floor most of the space is filled by the new chapel, and on the second floor are the well-arranged surgical and clinical theatres. Both these rooms are 40ft. long and 23ft. wide, and are beautifully lighted from the roof. Mr. Rowland Plumbe is the architect. The entire expenditure has been £16,000 for the buildings, and £9,500 for the general repair of the sanitary arrangement throughout the hospital.

MANCHESTER.—A new home for the various agencies in connection with the Charter-street Ragged School is about to be built. It will contain a home for working girls, a large mission-hall capable of holding 600 persons, a lads' club, men's club, and classrooms for the upper and lower mixed schools containing accommodation for 1,200 children. There will also be a nursery where children whose mothers are at work during the daytime may be left, and accommodation for cooking and serving cheap dinners to day-school children. The cost of the extension and the furnishing of the buildings when complete will be about £7,500. Messrs. Maxwell and Tuke, of Princess-street, Manchester, are the architects, and Messrs. Peters and Sons, Rochdale, are the builders.

SMETHWICK.—Last week the foundation-stone of the new church of St. Michael and All Angels was laid. Plans and specifications have been prepared by Mr. A. E. Street, of Cavendish-place, London, who estimates the total cost of building at £4,450, and it is expected that (inclusive of site) the present work will require a sum of not less than £5,250. Towards this sum £3,900 is still required. The church, which will be Early English in style, will seat 800 or 900 persons. For the present no tower will be erected. Under the chancel there will be a parish room and vestry.

Engineering Notes.

WILTS AND BERKS CANAL.—The directors of this canal have accepted the tender of Messrs. Laver and Co., Bath, for dredging the canal, repairing the bridges, wharf walls, and other matters. The canal is to be dredged to its original depth and sectional area for its entire length of 70 miles. This important inland navigation commences at the Thames, at the south side of Abingdon, and proceeding south-westerly past the town of Wantage, goes westward through the towns of Swindon and Wootton Bassett, and between Chippenham and Calne. Passing the town of Melksham, it terminates at Semington, where it joins the Kennet and Avon Canal. At Eastcott, in the division of Swindon, a branch known as the North Wilts Canal joins the Thames and Severn Canal near Cricklade. There are also branch canals to Wantage, Longleat, Calne, and Chippenham. That part of the river Thames where this canal locks into it is 180⅓ft. above the sea. From the commencement of the canal to the Wantage river, 7¾ miles, there is a rise of 96½ft.; thence to the last end of the summit level, 15 miles, there is a rise of 71½ft., or a total rise of 168ft. The North Wilts Canal, from Eastcott to Latton, at the junction with the Thames and Severn Canal, is 9 miles, with a fall of 58ft. 8in. to Latton. There are 57 locks, with an average fall of 7ft. 6in., and about 78ft. long. The summit level crossed by the Kennet and Avon Canal is 116ft. higher than that of the Wilts and Berks. To secure this lower elevation Brunel laid down the main line of the Great Western Railway alongside of this canal through Swindon, instead of following the more direct route through Hungerford. The distance from London Bridge to Bristol by this route is 197 miles. The Wilts and Berks Canal was laid and constructed by the late Mr. R. Whitworth. The present works are being carried out under the sole direction of the engineer, Mr. P. Munro, St. Stephen's-chambers, Bristol.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

KENT ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society was held on Monday and Tuesday last at Town Malling. The members met in the assembly-room on Monday morning for the transaction of general business, Earl Stanhope presiding. Afterwards they proceeded to Malling Abbey. The Rev. J. H. Timmins, M.A., treated of its history, and was assisted by the Rev. C. H. Fielding, M.A., whilst the architectural details were explained by Mr. E. P. Loftus Brock, F.S.A. St. Leonard's Tower was then inspected, under the guidance of Mr. Loftus Brock. The members next saw West Malling Church, which was described by the vicar, the Rev. J. H. Timmins. Carriages conveyed the members to East Malling Church, which was described by Mr. Loftus Brock. At the evening meeting, held in the assembly-room, the following papers were read:—"Notes on the History of Malling," by the Rev. J. H. Timmins; "On Old Burnham Chuch," which has recently been restored, by the Rev. Greville M. Livett, B.A.; "A Sketch of the Early History of the Malling District," by Mr. George Payne, F.S.A., hon. secretary. On Tuesday visits were paid to Bradbourn Place, where, by permission of the owner, Miss Twisden, the pictures, &c., were explained by the Rev. J. Francis Twisden, M.A.; to Leybourne Castle, with the Rev. J. H. Timmins as guide; to Leybourne Church, which was described by the rector, the Rev. C. C. Hawley, M.A., and to Totterscliffe Church. The so-called Druidical remains at Coldrum were inspected, under the guidance of the honorary secretary, and visits to Addington and Offham Churches closed a long and varied programme.

At the last meeting of the Cambridge Town Council, the salary of Mr. A. C. James, assistant to the borough engineer and surveyor, was increased £26 per annum.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., LVII. LVIII., and LIX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—F. E. and Co.—D. W. J.—A. W. K. and Co. A. and Co.—J. T.—L. and Co.—B. C. B. I.—P. S.—J. D. M.—S. R. Q. Co.—H. S. B. Co.

A. C. ROTHERY. (The Public Health Act can be obtained through any bookseller, and of Spottiswoode and Co., the Queen's printers. You can obtain particulars of the Sanitary Institute Examination at the Parkes Museum, 74A, Wells-street, Oxford-street, W.)

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Mephy," "Sassenach," "Smilash," "Idler," "Albyn," "La Cigale," "A Pilgrim's Progress," "Merlin," "Multum in Parvo," "G" in a horseshoe, "Thinlin," "Etudiant," Pair of Scales, "Eighteen 91," "Better late than never," Three Lions on a Shield.

Correspondence.

CUTLER v. NORTH.

To the Editor of the BUILDING NEWS.

SIR,—It is but fair, I think, to the profession and Mr. Cutler to state that, in opposition to the expert evidence given by those Fellows of the R.I.B.A. who appeared for Colonel North, Sir Arthur Blomfield, A.R.A., V.P.R.I.B.A., Sir James D. Linton, P.R.I., Mr. Thomas Harris, F.R.I.B.A., and myself were in Court, prepared to support emphatically the plaintiff; but it was not thought necessary even to ask for our evidence.—I am, &c.,

ROBERT W. EDIS, F.S.A., F.R.I.B.A.

14, Fitzroy-square, W., June 30.

A NEW DEPARTURE.

SIR,—It is left to your contemporary, the *Builder*, to give what I venture to think is a new departure in journalism, and I will ask your readers to decide whether it is fair and right. The facts are as follows: In printing my speech at the Institute of last Monday week they put an editorial footnote. I wrote a letter of explanation, pointing out the inaccuracy. They print a part of that letter, as if it were the entire letter, printing my name. I wrote pointing out the

great injustice, because they imply that the part of my letter they publish is all that I can say in proof of my claim of originality, which is not true.

The facts are, for the last nine years I have had a scheme of technical education, long before, I believe, anybody else had, and it does seem unfair that the *Builder*, having endeavoured to make out that the Association was first in the field, should refuse to publish the facts I sent them. May I venture to ask you to publish the letter they refuse?—I am, &c.,

BANISTER FLETCHER.

SIR,—In reply to your editorial footnote in your last issue, in which you say that, if I claim priority for my curriculum, you would point out that the (rejected) scheme appeared in the same number of the *A. A. Notes* as chronicled my appointment to the chair at King's College, the amusing conclusion being, because the *A. A. Notes* had not previously chronicled my appointment, I could not have been previously elected. Pardon my mentioning that the conclusion is fallacious. I was appointed to the chair as early as March 14.

It is fair to mention I had some considerable advantages in preparing my curriculum, because I had some nine years before prepared a syllabus. And again, in the year 1883, I prepared a scheme for the establishment of a Chair of Architecture, the correspondence as to which I may some day publish.

It is sufficient now to say that my proposals eventually could not be carried out, because I could not have sufficient space for the establishment of the museum I desired.

The curriculum I had to arrange at King's College necessitated altering, so that all the subjects could be completed within the three academic years. I confess my work was lighter, as it was limited to architecture and building construction. The courses as to geology, chemistry, mechanics, and electricity, my students would have the advantage of studying those subjects under the several able professors.

The difference between the schemes is really the important point. Mine is based on the preservation of the system of the articled pupil, the principal allowing such pupil the time to attend lectures and classes, instead of himself giving that portion of the instruction.

Your report of my speech lacks its usual completeness, as it omits reference to the statement I made that the scheme is proposed (as I originally intended) to be extended to University College, the Worshipful Company of Carpenters having made a conditional grant of £200 a year for that purpose.—I am, &c., BANISTER FLETCHER.

Intercommunication.

QUESTIONS.

[10578.]—**Plumbers' Mates' Society.**—Could anyone inform me of a Plumbers' Mates' Society that is held in London?—H. T.

[10579.]—**Ventilation.**—Can anyone kindly tell me how many cubical feet of space a sitting-room should contain to be healthy which will have a fireplace in it and window, and two gas-jets burning, and four adult persons and two children? Also, can anyone kindly tell me how many cubical feet a bedroom should contain in which two adult persons have to sleep? The room will have a window and fireplace in it, and a Tobin's tube 18in. by 4in.—RESPICE.

[10580.]—**Romanesque Style.**—Dr. Zerffi, in "Historic Art Studies," BUILDING NEWS, 1874, says a more correct technical classification of the Norman style in England is to speak of it as "Anglo-Romanesque." Is this an accepted idea? Was the Norman work in England contemporaneous with the Romanesque on the Continent? The name of a good work on "Romanesque," giving its details, would oblige.—W.

By virtue of the provisions of the Warrington Improvement and Extension Act, passed some months ago, the undertaking formerly carried on by the Warrington Waterworks Company became vested on Wednesday in the town council, who have agreed to purchase the works as a going concern at a total cost, with incidental expenses, of something like a quarter of a million of money.

The Bishop of London consecrated at Stonebridge Park on Saturday the newly-erected church of St. Michael and All Angels', a red brick and stone structure, built on a commanding corner site on the summit of a hill, adjoining Harrow-road. The church is of lofty proportions, and the roof of timber supported by stone columns and arches. The chancel portion and spire have yet to be built. The architect is Mr. Child (Messrs. Goldie, Child, and Goldie, of 10, Kensington-square). The church has seating accommodation for 650 persons.

A new Sunday-school in connection with the Whingate Wesleyan Chapel, Armley, Leeds, was opened on Saturday. The school adjoins the chapel, and contains a large room, infants' school, and five classrooms. The large hall is 52ft. long, and 36ft. wide, and is connected with the chapel by a corridor 8ft. wide. Accommodation is found for 470 scholars. The elevations are brick, with stone dressings, and the whole building is heated with hot water. The total cost is £1,000. The work has been carried out under the supervision of Mr. Fred. W. Rhodes, architect, Wortley, Leeds.

LEGAL INTELLIGENCE.

DAMAGES FOR BAD SANITARY ARRANGEMENTS.—In the Queen's Bench on Friday and Saturday, Mr. Justice Day and a special jury heard the case "Mathieson v. Gillespie." It was an action brought to recover £350 damages for defective sanitary arrangements, by which plaintiff suffered from bad smells; and for an order of the Court compelling defendant to put the drains in proper repair. The defence contended there were no smells, and that everything was in proper order; or, if there was any smell, it was caused by plaintiff and his servants improperly using the lavatories and sinks, &c., for the washing of utensils used in business. The jury found for the plaintiff to the extent of £100 in respect of rent and damages, and for the defendant for £58 16s. 8d. for rent. On the counterclaim there was judgment for the defendant.

NO NOTICE GIVEN.—At the Loughborough Police-court, on the 26th ult., Thomas Hearne, Skipworth-street, Leicester, who did not appear, was charged by Herbert Herrod, surveyor to the Barrow Rural Sanitary Authority, that, having erected a new dwelling-house at Sileby, neglected, before such building was occupied, to deliver a notice in writing of the completion of the work. Mr. Scott, clerk to the Barrow Sanitary Authority, said that the prosecution was taken under section 97 of the by-laws. Mr. Herrod, the surveyor, proved the case, and the Bench imposed a fine of £2, or, in default of distress, 21 days' imprisonment.

BUILDERS WITHOUT CAPITAL.—At the Norwich Bankruptcy Court, on Monday week, before Mr. Registrar G. F. Cooke, the examination took place of George Samuel John Porter Smith, Marlborough-road, Norwich, and Harry Watling, Sussex-street, Norwich, trading as Smith and Watling, building contractors, Pitt-street. Their statement showed liabilities £1,602 19s. 3d., and a deficiency of £1,222 17s. 7d. The debtor Watling stated that he was a journeyman carpenter when he joined Smith in partnership, and he was then possessed of two houses, which were mortgaged for £180. He had no cash, and the houses had since been mortgaged for the partnership. He had 28s. a-week before he joined Smith, and had had about 25s. since, so that he had derived no benefit. He had looked after the carpenters' work at the shop, and ordered the stock, leaving Smith to attend to the books, though he helped him in getting out contracts. Neither of them had any real knowledge of building. The work undertaken by the firm consisted of small contracts and speculative building, and it was on the former that the greater part of the losses was incurred. Smith, the other partner, said he was in business about six months before Watling joined him. When he started he had about £10 to £15 capital, and he had £25 when he went into partnership. When they took jobs, they contracted for their own work and obtained sub-contractors for other work, and then they became sole contractors. He attributed his failure to losses on contracts. The largest contract was for houses at Greenhills, and amounted to £2,225, and this was about a net job. They had lost money over the Central Café, the Gladstone Club, Beckham Church, and St. Mary's Churchyard. Beckham Church had been a great loss to them. He had never had anything to do with church-building before, but he had a young man to assist him who understood the work. He contracted to do the work for £900, as the architect said they could not do it for £820, which amount they gave as their estimate. The firm had lost no money outside the business, and he took about £2 per week. The examination was closed.

New business premises for Messrs. R. D. and J. B. Fraser have been erected at the corner of Princes-street and Museum-street, Ipswich. The architects are Messrs. Eade and Johns, and the builder is Mr. F. Bennett.

On Wednesday week the memorial stones of a new Baptist chapel in Queen-street, Erith, were laid. The structure is to be in the Gothic style of the 13th century, of cruciform design, having nave and transepts, with gallery on either side, and organ-chamber behind the rostrum. It is to accommodate 800 persons, and will cost about £2,000, of which about £1,020 is raised. Mr. John Wills, of Derby, is the architect.

The laying of the primary stone of the new St. Paul's Church, Tyndall-street, Cardiff, was performed by the Earl of Dumfries on Tuesday afternoon. The present school chapel is too small for the requirements of the district, and adjoining property has been purchased. The buildings standing on the site have been pulled down, and in their place will be erected a church in the Early French Gothic style. The total length will be 104ft. and the width 51ft, and there will be a gallery. Seating accommodation will be provided for 450 persons. The total cost is estimated at £3,000. Mr. C. C. Jones is the architect.

WATER SUPPLY AND SANITARY MATTERS.

BAD DRAINAGE IN LONDON BOARD SCHOOLS.—The Educational Department has complained to the London School Board that the Charing Cross-road school is in a "disgraceful condition" in respect to sanitary matters, and the details of this insanitary condition show that the school must be a danger to others than those whose duty compels them to be within the building. The school was a transferred one, and the Board is not primarily responsible for the drainage. Complaint is also made of the school buildings in Goodman's-yard, Minories, in the City division, also a transferred voluntary school, in place of which the Board is to build a new school. The condition of this building is stated to be dangerous to the health of children and teachers. The Wandsworth District Board of Works having drawn attention to the state of the drains at the St. Andrew's-street Board School, Wandsworth-road, the assistant architect has surveyed them, and reported the drainage to be in a "deplorable condition" from being ill-laid, and the expenditure to set the matters right will come to £600.

NELSON.—On Saturday the ceremony of cutting the first sod of a new compensation reservoir for the Nelson corporation was performed by the chairman of the water committee. The reservoir is situated at the foot of Pendle Hill, about five miles from Nelson, and impounds the Black Moss stream. It will cover 16 acres of land, and have a storage capacity of 40,000,000 gallons. The contract price for the reservoir, which is expected to be constructed in about 12 months, is £7,292. The contractors are Messrs. Etheridge, Clark, and Co., of Manchester, and the engineer, Mr. Newton, C.E., of Manchester.

REDDISH SEWERAGE.—At the last meeting of the Reddish local board it was decided to at once complete the sewering of the district. The sewerage scheme was started about four years ago, but when it was about half-finished the engineer (Mr. Vawser) unfortunately died. The work has since remained in abeyance; but the board have now appointed Mr. Theo. S. McCallum, A.M.Inst.C.E., of Manchester, to carry it on.

CHIPS.

The tender of Messrs. J. Harley and Sons, of Smethwick, has been accepted for building the nave of the new church at Hamstead, Birmingham. The cost will be about £3,500. The foundation stone is to be laid on Monday, July 27.

On Thursday week the Bishop of Sodor and Man consecrated the new chancel of St. Thomas's Church, Westfield-street, St. Helen's. In addition to the erection of the chancel, the edifice has been reseated and other improvements have been carried out. The total expenditure has been about £3,300. The architects have been Messrs. Aldridge and Deacon, of Liverpool, and the contractors Messrs. Rothwell and Sons, of St. Helen's. Mr. R. R. Lowe executed the wood pavement.

The new schools in Pydar-street, Truro, in connection with St. Mary's parish, were opened on Monday week. These schools, which are built for about 400 scholars, and cost nearly £3,000, were designed by Mr. Swift, of Messrs. Henderson and Son, architects, and the contractor was Mr. James Julian.

Mrs. William F. Coles, of New York, has presented to the Wardens of the Cathedral of St. John, now in course of construction there, twelve magnificent tapestries acquired by her in Italy from the Barberini family, at the price, it is said, of 375,000f. This great series, showing the Passion of Christ, belonged once to the family of Pope Urban VIII.

The Longmore Hospital for Incurables, Edinburgh, is about to be enlarged by the erection of a new wing, at a cost of between £7,000 and £8,000. Messrs. Peddie and Kinnear are the architects.

The Tamworth rural sanitary authority have decided, in accordance with a report of their surveyor, Mr. H. G. Clarson, on the water supply of Kingsbury, to apply to the Local Government Board for authority to expend £250 in sinking a well in the permian formation at Kingsbury Wood, as a preliminary step towards carrying out a scheme of water supply by Mr. Clarson, estimated to cost £6,000.

On Friday a pawnbroker's shop at the corner of Tamworth-street, Hulme, Manchester, fell with a loud crash. A staff of men had just arrived for the purpose of enlarging the windows. The contractor (Mr. Swarbrick) had entered the building, when, without the slightest warning, the whole place fell in. Mr. Swarbrick had a narrow escape, and the workmen who were in the street also narrowly escaped, as the walls fell outwards. One labourer was caught by some falling bricks, but was able to walk home. The building is completely wrecked, only the roof being left.

Our Office Table.

IT is proposed, during the International Congress of Hygiene and Demography, in connection with Section VI.—Architecture in relation to Hygiene—to hold an exhibition of drawings of sanitary construction. The committee of this section will be glad to hear from members of the architectural and engineering professions in respect to any drawings they may be willing to contribute. The drawings should necessarily be of a constructional and practical character, and include such subjects as foundations in relation to ground air and dryness, drainage, water supply, lighting, heating, and ventilation. It is proposed to exclude perspectives, except bird's-eye views intended to show the disposition of the buildings. The drawings will be exhibited from the 10th to the 17th of August in the Library of the University of London, which will be the reception-room of the Congress. The committee reserves the right of making a selection from the drawings, if necessary, and will be greatly obliged by an early response from intending exhibitors to Mr. Thomas W. Cutler, hon. secretary Exhibition Sub-Committee, 5, Queen-square, W.C.

THE announcement of the intended resignation of Captain Eyre Massey Shaw, C.B., Chief of the Metropolitan Fire Brigade, has been received with regret and surprise. After a few months' experience at Belfast as chief of the police and fire brigade, he was appointed to his present office thirty years ago, after the fatal accident to Mr. James Braidwood at the Tooley-street fire. The manner in which he has secured discipline in his too small force is widely recognised. Captain Shaw's little work on "Fires in Theatres," written in 1876, and republished with additions two years since, has done much to educate the public and local authorities in the structural and mechanical safeguards against the spread of fire in places of amusement, and in requiring better means of exit from such buildings.

THE Electrical Company intrusted by the Commissioners of Sewers with the lighting of an area embracing about two-thirds of the City of London last week publicly demonstrated, on a comparatively limited scale, the nature of the installation they intend to put down. The experiment took place in Queen Victoria-street, where 26 arc lamps, worked from two dynamos, driven by a 20 horse-power indicated steam-engine, were kept alight from 9 to 11 o'clock. The gas was extinguished all along the street during the period of the experiment, and the electric light was steady and efficient. The mechanism actuating the carbon pencils is inclosed in a hexagonal pear-shaped lamp, the glass of which is obscured, and consequently much of the light developed is absorbed by the glass. The electric lanterns are placed on the top of plain iron columns 19ft. high and 120ft. apart. It will be for the Commissioners of Sewers, whose representatives witnessed the experiment, to report whether the lanterns and columns meet with their approval.

A FATAL accident befell Mr. Reginald Colebrooke Reade, M.A., of Torquay, diocesan architect for Exeter, on Sunday afternoon. Mr. Reade and a Torquay friend, Mr. Robinson, went to Dartmouth for a walk, and in Compass Cove, about four miles from that borough, they had a bathe. They had considerable difficulty in getting down from the cliff to the shore, on account of the slipperiness and steepness. Mr. Robinson finished bathing first, and ascended the cliff by the way they came, leaving Mr. Reade sketching below. After a couple of hours had elapsed, Mr. Robinson descended the cliff again, and there found his friend lying on the rocks in a terribly bruised and unconscious condition. Mr. Reade was conveyed with all despatch to Dartmouth Cottage Hospital, where he died the following evening from injuries to his head and leg. Deceased had resided at Torquay for several years. He was educated at Eton, he afterwards went to King's College, Cambridge, where he took his M.A. degree. He was about 35 years of age.

THE third annual meeting of the Guild and School of Handicraft, which is held at Essex House, Mile-end-road, took place on Saturday, when the new workshops and hall were opened by the Marquis of Ripon. The report stated the work was of an entirely practical nature, and had direct relation to the industrial training of the pupils. Among the new lines of work at present being taken up by the school, are classes for brazing and metal-work, gold and silversmith's work, English leather industry, guild and school press. The committee invite the further financial support of the public, and especially those who see in the School of Handicraft a genuine effort carried on by men who were artisans themselves for the improvement of handicraft and the application of art to industry. In addition to the work-rooms, there is a large garden with lawn-tennis courts.

CHIPS.

The church of Ormskirk has just been restored at a cost of £17,000. It is one of the most interesting churches in the country, dating from 1080. The Derby chapel, which for 300 years has been the burial-place of the Earls of Derby, has been restored at a cost of £1,500 by the present earl. The church has a massive tower and spire, standing side by side, and in that respect is unique in England. The work of restoration has extended over 12 years.

The Liverpool city council have decided to engage the services of Mr. G. F. Deacon, engineer, for the completion of the Vyrnwy water supply works, at an annual salary of £875, and for two years after that date as consulting engineer for the works, at a fee of £500, in both cases in addition to travelling expenses.

The ceremony of dedicating the two new treble bells added to the peal of eight at St. Sidwell's, Exeter, was performed on Saturday. The bells have been cast by Mears and Stainbank, and have been hung by Mr. J. Stokes, Woodbury. An old tower arch, which has been hidden from view since the last century, has also been opened out by Mr. Harry Hems, by which the belfry faces into the church. It is very finely moulded, and is Early 15th Century in style.

The parish church of Allerton, Somersetshire, has just been reopened after renovation, including redrainage, new heating apparatus, and the erection of a new vestry, all works carried out by Messrs. Merrick, of Glastonbury. A new organ is in course of erection by Messrs. Vowles, of Bristol, at a cost of £200.

The trustees of the National Art Gallery of New South Wales, who have hitherto restricted their competitions to oil and colour students, have decided, in response to an influential memorial, that next year prizes shall be offered for architectural drawings and sketches by students.

On Saturday the Mayor of Heywood opened the new public baths at Heywood, which have been given to the town by Mr. Alfred Grundy, Manchester. The total value of Mr. Grundy's gift is about £2,500.

Three stained-glass windows which have been placed at the western end of Almondbury church as a memorial of the late Miss Sholto Vere Hare were dedicated on Sunday. They were designed by Mr. Maycock, and executed by Messrs. Hardman, of Birmingham. The central window—that in the nave—shows our Lord seated as the King. The window in north aisle represents the Ascension, and that in south aisle St. Mary Magdalene in the Garden.

The foundation stone of a mission hall was laid at Freemantle, Southampton, on Friday. Mr. S. Kelway Pope, M.S.A., is the honorary architect, and Mr. T. J. Jukes the contractor. It will accommodate 160 persons.

The Maidstone Infectious Hospital has been renovated and redecorated, the two wards, the disinfecting house, the laundry, and the mortuary having all undergone restoration by Mr. Albert Trendall, under the supervision of the borough surveyor, Mr. W. G. Scoones, C.E.

A memorial has just been placed in the Pole chapel or south transept of Shute Church, near Axminster, in commemoration of Lady Pole and her three daughters. The work is executed in alabaster and marble, and was carried out by Mr. Harry Hems, of Exeter.

The Legislature of Massachusetts has just passed a law limiting the height of buildings in cities in that State to 140ft.

One of the old historic churches of Lancashire—Ormskirk Parish Church—is to be reopened to-day, after complete restoration, which has cost about £17,000, of which £1,500 only is required to free the sacred edifice from debt. This ancient church, dedicated to SS. Peter and Paul, is a magnificent old building, of great interest. The Derby chapel, on the south side of the chancel, has been the burying place of the Earls of Derby for the past 300 years.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (To-MORROW). — Architectural Association. Vacation Visit to Winchester. Train 9.5 a.m. from Waterloo.

TUESDAY.—Glasgow Architectural Association. "English Renaissance," by John White. 8 p.m.

SATURDAY.—Architectural Association. Vacation Visit to Haileybury. Train 2.10 p.m. from Liverpool-street.

National Registration of Plumbers.—Plumbers Registered since last List.

PROVINCIAL MASTERS.

Bellerby, W., Robert-street, Harrogate.
Benson, C., Knaresborough.
Best, A., Somerset-place, Teignmouth.
Cariss, T., Market-place, Easingwold, Yorks.
Corfe, J., 10, Lindale-road, Claughton, Birkenhead.
Garland, G., Bodmin.
Greaves, A., 3, Wills-road, Ilkley, Yorks.
Holding, J., 4, Woolton-road, Garston, Liverpool.
Johnson, C. H., 131, Chatham-street, Liverpool.

PROVINCIAL JOURNEYMEN.

Campbell, T., 18, Hall-street, Southport.
Clayfield, W. G., 35, Hill Park-crescent, Plymouth.
Coates, G., 5, Westmoreland-street, Harrogate.
Elleray, T. W., 3, Thirsk-terrace, Northallerton.
Hesford, J., Prospect-hill, Haigh, Wigan.
Le Gross, S., 6, Belmont-street, Plymouth.
Martin, T., 26, Elizabeth-street, Preston.
Parfitt, J., 27, Delph-lane, Woodhouse, Leeds.
Pritchard, T. J., 16, Howard-street, Iffley-street, Oxford.
Raper, W. T., Snaith, Yorks.
Scaife, J., 16, Westfield-view, Wakefield.

Townsend, J., 18, Bishopsgate, Westgate, Wakefield, and
Gorman, D., Charleroi, Washington County, U.S.

Trade News.

WAGES MOVEMENTS.

KIRKCALDY, N.B.—The operative masons who asked for an increase of ½d. per hour, as from Wednesday last, the 1st inst., have declined an offer of ¼d., with a six months' guarantee.

MANCHESTER CABINET MAKERS.—The members of the Manchester branch of the Alliance Cabinet and Chair Makers' Association held a demonstration at Belle Vue Gardens on Saturday. Marching from their Mason-street club-room to Stevenson-square, they there held a meeting, which was presided over by Mr. M. Ham, of London, general secretary of the Union, who urged combination, and assured the Manchester men of the co-operation of those engaged in the London trade. Mr. L. Remond, the Manchester secretary, detailed the grievances in connection with the practice of underselling, which tended to sweating.

NEWCASTLE-ON-TYNE.—The application made some time ago on behalf of the Newcastle, Gosforth, and District Operative Stonemason's Society to the Master Builders' Association for an advance in wages and also a reduction of hours, was finally dealt with on Saturday afternoon, when a meeting was held of representatives of masters and men. The masters agreed to concede the advance of wages asked for—namely, from 8½d. to 9d. per hour. The demand for a reduction of hours was withdrawn, as was the request that no dressed stones should come into the district.

NEWPORT, MON.—The bricklayers' strike practically closed on Monday afternoon, when the men decided to return to work on the employers' terms of 7½d. per hour, the halfpenny in dispute being submitted to arbitration. The men will return to work immediately, on condition that the employers fix a reasonable date for the arbitration, and give them an equal voting power in the appointment of the arbitrator selected.

NORWICH.—The master builders' stated on Saturday that they could make no further concessions to the men. Accordingly the Mayor at once invited the operative bricklayers and carpenters to a conference at the Guildhall. The men assembled in large numbers, the Sessions Court being crowded. The Mayor pointed out that, through his intervention, concessions had been made on both sides, and he strongly emphasised his desire now to bring about a termination of the deadlock. He had urged them, in the interests of the city, to accept the employers' terms; but, so great was the sacrifice, he was not surprised that they declined to make it. They had, however, shown such self-control, intelligence, and moderation, that he thought they would reconsider the matter. The masters had adopted a mistaken policy, and the men had not got all they were justly entitled to; but, as the latter were offered a code of rules and an advance of wages, he appealed to them, in the interests of all, to now return to work, making the best of the benefits they had gained. After a short discussion Mr. Cleverley (representative of the carpenters) moved that a vote be forthwith taken upon the

Mayor's suggestion; but subsequently the carpenters and joiners met privately and declared against the proposition.

PAISLEY, N.B.—The masons commenced to receive on Wednesday an advance of ½d. per hour in wages, raising the amount from 7½d. to 8d.

PRESTON, LANCS.—Last Christmas the Preston stonemasons gave their employers six months' notice of a demand for an increase of ½d. per hour, with an extra ½d. per hour to those engaged in setting stonework. After negotiation with the Master Builders' Association, the demands have been conceded of a halfpenny per hour advance, making the wages now 9d. per hour; but the halfpenny extra for setting has been withdrawn. The increased wage began on Wednesday.

CHIPS.

At their meeting on Tuesday, the trustees of the Campbell College, Belfast, decided to accept the tender of Messrs. Henry Laverty and Sons, for the erection of the college buildings. The contract price is £54,214, and the builders are bound to have the work completed by 1st May, 1893. The architect is Mr. W. H. Lynn, R.H.A.

The infants' school at Upper Stratton, near Swindon, is about to be enlarged by the Stratton St. Margaret School Board, at a cost of £750. Mr. H. Looker, of Stratton, will carry out the works from the designs and under the superintendence of Mr. William Drew, M.S.A., and Son, of Swindon.

The coroner's inquest on the body of Robert Nesbitt, an Ulster road-surveyor, who mysteriously disappeared last November, concluded on Tuesday afternoon in an open verdict. The police, however, believe that the man was the victim of foul play. The remains were found by some boys, on Monday afternoon, in a culvert under the main road from Belfast to Downpatrick. The police are working on a clue which they are confident will lead to the discovery of the murderer.

New bank buildings are being erected at the corner of Cowell and Stepney streets, Llanelly. Queen Anne style, they are built of red stone and red bricks, both from Ruabon. Messrs. J. Buckley Wilson and Glendinning Moxham, of Swansea and Llanelly, are the architects, and Messrs. Randell Brothers, of Llanelly, the builders.

The roof over two bays at the west end of the chancel of Manchester Cathedral has been thoroughly examined, the result being that the timbers in John Huntington's original ceiling are more decayed than was at first conjectured. At the same time it is hoped that they are sound enough to undergo the process of redressing, so that the ceiling may be retained as a momento of the first Warden of Manchester (from 1422 until 1458), and founder of the chancel itself. In order to carry out this restoration, it will be necessary to construct an entirely new chancel roof, which will form a complete support to the redressed timber work in the original ceiling.

There are now 957 street railways in the United States and Canada. Of this number 589 are worked by horses, 49 by cable, 246 by electricity, and 73 by steam. This combination of motive powers does service over 8,818 miles of track. The smallest town in the United States which has an electric street railway in operation is Southington, Conn., with a population of 5,400. The largest electric railway is at Boston, Mass.

The additions to Haileybury College, built from the designs of Mr. Reginald T. Blomfield, were formally inaugurated on Tuesday.

Lord Justice Bowen will preside at the annual meeting of subscribers to the British Schools at Athens, which will be held this (Friday) afternoon.

The death is announced from Wellington, N.Z., of William Neusham Blair, M.Inst.C.E., Engineer-in-Chief, and Under Secretary for Public Works, for New Zealand. Mr. Blair was in his 50th year.

The French School of Athens is in treaty for leave to excavate the prehistoric building at Cnossus, in the island of Crete, which Dr. Schliemann had intended to dig out, in the hopes it would prove a palace like that of Tiryns or Mycenæ.

A cottage hospital and institute is about to be built at Almondbury, near Bristol, at a cost of £4,000, borne by Mr. Sholto Vere Hare. It will be built of brick, with Ham Hill stone dressings. Mr. C. E. Ponting, F.S.A., of Marlborough, is the architect, and Mr. J. Perkins, Lower Redland-road, Bristol, is the contractor.

The reopening of West Buckland parish church after restoration took place on Friday. The church has been reseated with pitch-pine benches, the aisles have been laid with encaustic tiles, a new stone pulpit has been constructed, the old western gallery has been removed, and the west arch and west window thereby opened up, and the windows have been reglazed. The interior walls have been replastered in stucco, a new vestry has been provided, and the exterior stonework has been restored.

Holloway's Pills have the power of cleansing the blood from all noxious matters, and at the same time removing any irregularities which their presence may have already produced in any organ. Holloway's Pills expel all humours which taint or impoverish the blood, which they purify and invigorate, and give general tone.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear.
VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1905.

FRIDAY, JULY 10, 1891.

BURY MUNICIPAL BUILDINGS AND MARKETS.

BURY, the busy and thriving Lancashire borough, is about to emulate other greater towns of the North in the erection of municipal buildings and markets that, for size and completeness, will compare with those of Bolton, and even of Manchester. To the competition invited by the Corporation of Bury for designs, a numerous and able response has been made, no less than 37 sets of plans of more than ordinary merit for the municipal offices having been received, and are now on view at the Corporation offices. Mr. J. Murgatroyd, F.R.I.B.A., of Manchester, was appointed assessor, and his decision appears, on the whole, to have left cause for little dissatisfaction. The 37 sets were, after considerable study, reduced to eight for further examination. To prevent any possible miscarriage, the assessor ordered that the mottoes should be covered over by a label with a number, and this plan has been carried out. The first premium of £150 has been awarded to No. 17, "Donovan," by Mr. A. N. Bromley, F.R.I.B.A., Nottingham; the second, of £100, to No. 41, "M" in circle, Mr. H. T. Hare, A.R.I.B.A., London; and the third premium of £50 to No. 27, "Rectus," by Messrs. Everard and Pick, of Leicester.

The obtuse-angled triangle formed by the three streets which surround the site intended for the municipal buildings, has been skilfully turned to account by several of the competitors, some taking Mr. Waterhouse's admirable plan of the Manchester town-hall as the principle of distribution, others exercising their own ideas as to the filling-in of the central area formed by the surrounding blocks. The Market-street frontage being the longest of the three, has been generally made the principal façade (some few adopting the Haymarket-street), the remaining sides of Moss-lane and Haymarket-street forming an obtuse angle between these two streets, which we may designate the "apex" of the triangle. Nearly all the competitors have disposed their blocks of offices around the streets or triangle, with corridors of access along the inner sides, lighted from a central court or courts, while the central area has been utilised as the site for either police-court, council-chamber, or both. It is unnecessary to lay down here any principle, though the centre-court position has the advantage of being retired and quiet for the functions carried on in those important departments; on the other hand, we thereby lose the value of making either the court-house or council-chamber an external feature. In disposing these two blocks various plans have suggested themselves to the authors—some adopting an axial or symmetrical arrangement, others squeezing them into the area without regard to any rule. The importance of placing the police cells within the central area, and of making a van entrance into it, cannot be over-rated; again, this open space affords a capital space for the principal staircase, and for the blocks of lavatories. Many of the authors have sacrificed the area by crowding it with various apartments, leaving small and irregular wells for light; one has adopted the plan of placing the court and council-chamber parallel to the side blocks. As regards cost, the sum of £60,000 for the building and sculptural decoration, but exclusive of internal decoration and fittings, was laid down as the limit, though many have far exceeded that amount. The style adopted by the majority of competitors is some phase of French or English Renaissance; a few have adopted Gothic, fewer still Classic. Considering the triangular disposition of the blocks and the acute angles, the Renaissance or Gothic appears to be the most suitable. The assessors' predilections have certainly agreed with the general preference.

The first premiated design (by Mr. A. Nelson Bromley, of Nottingham) has undoubtedly many excellent points of plan. The triangular area of the site has been well utilised without waste, and the main departments placed in convenient proximity, yet with due attention to their separation. Taking first the ground plan, the main entrance is in the centre of Market street front; the staircase-hall is well lighted by the side courts; the waterworks department is on the left of entrance, then follow the medical and school departments at the angle of Moss-lane and Market-street. On the right side of entrance is the borough treasurer's office, including angle of tower; the gas department is on the Haymarket-street side, and the police yard entrance on Moss-lane side of triangle, another entrance being at the apex of the two sides. The corridors are 7ft. in width, and are well lighted from the courts. As Mr. Murgatroyd points out, the water and surveyor's departments are too much separated. On the first floor, the reception rooms occupy the central part of the Market-street front, and form an emphasised centre to this façade. The council-chamber occupies the middle of the interior area, out of the noise of the streets, and leaving areas for light and air. It is placed with its axis parallel to the Market-street side, and is in direct communication with the reception room, the main staircase between, and the cloak-rooms. The police-court is at the south of reception room, its end lighted from Market-street, and the magistrates', solicitors', and witnesses' rooms are in connection with it, and form the corner block, having frontages in Market-street and Moss-lane. The court is approached by a wide corridor along the Moss-lane block. The building inspector is near the angle on the last-named block, the surveyor has the corner, and the committee-rooms follow, facing Haymarket-street, the town clerk occupying the whole of the angle between this and front side, including the octagonal room of tower. The kitchen, offices, supper-room, and drawing offices are placed on the second floor. In the basement are the health and water offices, the police covered shed, cells, gas, weights and measures, borough treasurer, and stores. One of the desirable points of the plan is the van entrance into courtyard, by which the prisoners are enabled to be quietly transferred to and from the van. In addition to the main entrance, a public entrance is placed at the Moss-lane corner, another at the angle between Moss-lane and Haymarket-street, and a third entrance in the middle of the latter street front. The style partakes of a Renaissance character with Flemish features; the windows of the reception-room are elliptical headed and traceried; there is a gabled centre and flèche, and this central portion of the market street façade is flanked by turrets, corbelled at the angles. The side-wings are broken, and a lofty octagonal tower, not included in the estimate, is at the north angle. The Moss-lane elevation is plain; the council-chamber at top has a flat ceiling, with side windows; the police-court is top-lighted by a lantern.

The second premiated design (Mr. Hare) has also a well-arranged and grouped plan; the departments are distinct and placed in suitable positions, except the surveyor, whose department on the second floor is out of the way. The ground floor shows a centre entrance, with the water department to the left and the borough treasurer's on the right. There is a public entrance to rates office from Haymarket-street, also to gas offices. The chief constable occupies the apex between Moss-lane and Haymarket-street. The entrance hall, with cloak-rooms, &c., form a central block having three small areas. The borough treasurer's corridor appears inadequately lighted through the rates office. On the upper floor the council-chamber is placed in the centre of site, its axis at right angles to Market-street, dividing the space into two large triangular areas or courtyards; the reception rooms are an ample and splendid suite of apartments facing that street; the police-court and magistrate's rooms front Moss-lane, and the town clerk's offices the Haymarket front. The corridors are not so happily treated as in other plans: there is no police-van entrance. Both the surveyor and the remainder of the town clerk's offices are on the second floor. The council-chamber has a coved ceiling with raised flat ceiling; air-flues and shaft for ventilation are shown over it; the lavatories are located under the sloped gallery. Externally, the design is represented by an elaborately-drawn set of elevations in ink, Renaissance in style. The main façade, well broken in plan, has an imposing balanced centre and wings, the centre block with a high roof and bold turret or flèche, and three ornamental gables; the wings are low and well-broken in outline, the corners are octagonal in plan, carried up as towers with low roofs and arcaded sides. The windows are large and mullioned, of Late Gothic feeling. An effective perspective of principal front is sent, and some good details are shown.

The third design, by Messrs. Everard and Pick, shown by a tinted sepia elevation, is plain, and well treated in the same style, with high roofs, and French in general character, but without a tower. The centre of main front is rather short; there is an order of columns to the first-floor story. In plan the authors have shown a simple and skilful adaptation. The corridors are continuous and parallel to the three blocks; that along the main front has an entrance at each end, which is certainly an improvement on the stopped end arrangement adopted by so many. A centre entrance and hall, lighted by court, gives access to water department, school offices at angle, on left to gas department. Along the Moss-lane front are placed the rates offices, large collection room being on the inner side of corridor, lighted by central court. In the Haymarket-street block are the police offices and cells, the latter corresponding to the rates collecting office, also lighted by court. There are four good courts. The suite of reception-rooms on the first floor are in the front block, the police-court is placed over the cells behind the Haymarket-street block, and thus retired from the street, with the solicitors' and witnesses' rooms fronting that street, and the town clerk's offices and council chamber over the Moss-lane block. The council chamber over the rates office is quiet also. Well-lighted corridors, courts, and division of departments are secured, the angle staircases at the end of corridors and the architectural character of the plan generally are commendable. The borough surveyor is at the obtuse angle. The second floor has the surveyor's drawing-office and the other rooms of the town clerk, the caretaker being located in the upper floor of centre front block. The medical officer and inspector would have been better placed on the ground floor instead of in the basement.

Five designs have been commended by the assessor. One of these, "Gladys," by Mr. H. A. Matear, Liverpool, has a fairly good plan and artistic treatment; but we do not like the broken angle between the health and water-office departments at the obtuse angle. The rates office block placed across the central area obliquely is awkward. The principal

entrance is in the centre of Haymarket-street side, adjoining which are the cloak-rooms and committee-rooms; the borough treasurer is placed in the Market-street block, and occupies a position that would be better given to the town clerk. The police and health departments, separated by an entrance, are in Moss-lane. The council-chamber is over the water offices at the apex, the police-court in Moss-lane, the reception-rooms front Haymarket-street, the town clerk's offices Market-street, and the surveyor at the corner of Moss-lane and Market-street. The corridors are well lighted, but the areas and angles are awkward. The elevations are in a kind of mixed Romanesque and Renaissance features, clever and dignified, especially the Haymarket and Market-street fronts, with their lofty tower. The corner view of this tower is effective. The first-floor windows are round-arched, with central gable and high roof. The corner sketch on the frame is pleasing. "Spero," by Mr. Chas. Bell, London, is Renaissance of a type common in London, rather too Domestic in type, with a lofty corner tower near north angle. The plan has merit, despite its small central court and central corridors. The main entrance is in Haymarket-street. "Sanglier Range," by Chorley and Connon, Leeds, is a geometrically-balanced plan, with a quadrant-shaped arrangement of buildings towards the obtuse angle. The first-floor plan shows the Market-street front, devoted entirely to the suite of reception-rooms, and council chamber, a long, parallel corridor traversing the whole length of block. The town clerk's offices form one of the quadrant blocks, and the surveyor the other; the police-court occupies the centre at the obtuse angle, and forms an elongated octagon flanked by circular stair turrets, surmounted by conical spires. The elevations toward the side streets are irregular; the circular towers rise at ends of main front with conical spires, resting on open peristyles. The front has a broken gabled façade. "Mind and Work," by Messrs. Morley and Woodhouse, Bradford, is the motto of an elaborate set of elevations, executed with extreme delicacy of detail; but the grouping of gables and the repetition of windows are not pleasing on the whole, and there is a want of breadth and rhythm—a corner tower is shown. The plan has some good details; but the areas for light are restricted, and the central space is too much filled up. The main entrance is in the centre of Haymarket-street, and grand stairs behind; the treasurer is on the right hand, the water on the left, police and gas being located along Market-street—questionably we think. On next floor, the reception-rooms front Haymarket-street, the council-chamber at one end. The police-court is over the parade, and cells are in centre of site. The surveyor's offices front Market-street. The inquiry office and drawing office in this and other designs are unnecessarily close, as it is found that inquisitive ratepayers are often unwelcome intruders in the drawing department. The "plan" room for storage of drawings is also too small, and the corridors might be improved in their lighting. "Sub Spe" (Mr. F. S. Tulloch, London) is a symmetrical plan with wide lighted corridor round the central court, a main entrance from Market-street, having the offices of treasurer on right, those of water and gas on left, with the police department at the apex of triangle, and police-court above. The reception rooms are in front above, with council chambers, and in Moss-lane block the offices of town clerk, and on the other side the surveyor. The front elevation is dignified, Renaissance in style, having a high hipped roofed centre block with flèche, terminated at the angles by ogee-shaped domical roofs and flanking turrets in pairs on either side of centre. The detail is refined, and there is a pleasing breadth, but the windows are narrow and small for offices and reception-rooms, especially so in the Haymarket-street front.

We think one or two excellent designs might have been included in the list of "commended." One of these is "Lancashire," the authors Messrs. Mawson and Hudson, Bradford, a design with a clever and broadly-treated front elevation, the proportions of piers and apertures rhythmic and pleasing. A well-proportioned campanile rises near one end of the main front, modelled after the Giralda at Seville. The plan is less happy. The front block corridor is broken at the hall, so the continuous promenade is lost. Three angle entrances are shown. The rates and police departments are not the most desirable to occupy the Market-street block, which they do here. The council chamber is placed in the centre of the triangular area, parallel to the reception-rooms, which occupy a considerable part of the main block, divided by the tower from the police department at the south end of the same block. The borough court is placed rather awkwardly at right angles to the main block, the end abutting on Moss-lane. Some finely-executed drawing of details is shown; the council chamber has a flat segmental ceiling of plaster. "Municipal" (Messrs. Brook and Langham), shown by a bold corner perspective of plain Renaissance character, is another able design. The circular corner entrance with tower in Market-street is a departure from other treatments. The treasurer's offices face Market-street, the health at the left end, and police at the apex and sides. The octagonal police-court at apex on the first floor, with high pyramidal roof, is a feature; the corridors are fairly lighted. The council chamber is on centre of site. Other designs can only be glanced at here, though some of them possess merit of a high order. "Neloah" is a fairly-balanced arrangement of departments; but the side corridors are bent at ends into main corridor—a weak point. The cells form a keystone-shaped block at the apex of triangle, with treasurer on right, water and gas offices on left of Market-street entrance. The style is Gothic, but unsatisfactory in the elevation. "Industria" is rather awkward in the massing of departments; a huge centre tower rises in Market-street, a little overpowering; the style is of the usual Renaissance, and a clever perspective and drawings are sent in. "Red Tape" has areas for light too small; the council chamber is semicircular and in the centre of side, but there is a want of architectural arrangement. "Civitas" is a French Classic treatment, but of poor proportions, with indifferent plan. "Justice," in a circle is elaborate, but rather too complicated in plan. "Red Rose," "Facility," "Briar Rose," "Lux," "Light," have more or less ability, but lack coherency in the arrangement of departments, or are too crowded in the centre. "Jam Satis" is in quiet Renaissance, but the areas in centre are small and crowded, and this fault of crowding is discernible in "Usui Civium, &c.," "Lege," "A" in circle, "Stability," and several others. A clever sepia sketch is sent with "Simnel," but the elevation lacks coherency and character, and the corridors are ill-arranged and dark. The fault of imperfect light is general; in many of the plans the departments are not sufficiently separated, or are too crowded. Many of the authors have failed to provide suitable positions for the lavatories and closets, or have placed them rather objectionably close to offices, instead of arranging them together in the courtyards. The approaches to the reception-rooms and court should be ample and commodious, the departments sufficiently distinct and easy of access, and these are points that have fairly been kept in view by the authors premiated.

With regard to the materials, the author of the first premiated proposes to use a selected kind of Derbyshire stone, and to place the whole on a rusticated basement, to prevent injury and disfigurement. Polished granite will be used for the entrance pilasters; the roofs are to be covered with green Westmorland slates; and the large flats to be covered by asphalte upon concrete and iron. Terracotta is specified to be used in the entrance-halls and staircases, and glazed brick is proposed for the linings of the police-court, staircase, and gallery. The upper part of the tower is not included in the cost of £60,000. The author of the second premiated design proposes to use Yorkshire stone for the facing of the three fronts, the roof to be of green Westmorland slates, and the turrets of copper. The floors are proposed to be fireproof, with steel joists and concrete, the internal courts lined with glazed bricks. Rangoon teak and other hard woods are specified for the panelling of the state rooms, and American walnut for the dado to rates office.

The markets and abattoirs, for which premiums of £75, £50, and £25, were offered, are represented by a dozen designs, a few of them of much merit as architectural renderings of a very unpromising kind of problem. Mr. Murgatroyd remarks on the study given to markets, especially to abattoirs, on the Continent, and he finds traces of this study in two sets of designs. Overhanging roofs, and cool, brick-vaulted or double-roofed buildings for slaughtering are generally adopted. One of the important points of the plan is the desirability of providing convenient roadways for access and egress. The site selected is at one end of the land for the municipal buildings, and separated from it by Moss-lane. The requirements were for a general and fish market, which are to be contiguous, though separate, with entrances between, chiefly from Moss-lane; the abattoirs, in addition to the slaughter-houses and lairs for cattle, had to contain a slaughter-house and lairs for pigs, for condemned carcases and live cattle, stores for skins and hides, &c. The assessor has awarded to "Northern Light" (Mr. Archibald Neill, of Leeds) the first premium. The character of the elevations and the general grouping of the buildings are meritorious, and are shown in some effective elevations in chalk and India ink. The shops along Moss-lane are of two stories; the upper one may be approached by a gallery behind. The subdivision of the area in this plan is perhaps expensive in forming so many roofs, though artistically this is a merit. The central area of market is set apart for vegetables and fruit, the sides for poultry and game, bacon, eggs, &c. Lock-up stalls for butchers, dry goods, cloth, &c., are between these divisions, with gallery above for storage and sale. The retail fish market is at the side, with inclined roadway. An octagonal dome of iron, with gallery round upper floor, is shown. The abattoirs have suitable inclined approaches, with stores below. There are three ranges of blocks, a lair and slaughter-house, with ventilating passage between, and a verandah-sheltered avenue on each side of central meat store. The roofs have raised skylights and projecting verandahs to keep the walls of meat-store cool. The second premiated design, "Poleaxe," by Messrs. Lewis, Hornblower, and Son, Liverpool, has a Continental arrangement of abattoirs; the general market, with arched roof of timber and iron, has well-arranged stalls, &c., and tasteful elevations of Italian design. The third premiated, "Experientia," Mr. Harry B. Buckley, Leeds, shows the general market on the right-hand side, surrounded by shops, with three rows of stalls for bacon and cheese, crockery, poultry, boots, flannel and fancy goods, fruit, and vegetables. The roofs are in two spans, top-lighted, and the shops have rusticated treatment. The lairs are at right angles to the slaughter-houses, and the

author has shown the whole surrounded by roads and an incline to railway, which has thus reduced the area allowed on the plan. A clever sepia sketch is shown by "Utility"—the market has three elliptical spans, with surrounding shops, and the elevation is appropriate.

THE LOCK-OUT OF LONDON CARPENTERS.

AS the Central Association of Master Builders declined last week to enter into negotiations for a settlement in the building trade, ostensibly on the ground that the United Trades Committee had used threats, subsequently modified to objection to the "unconciliatory tone" of the committee's letter, the men were drawn out on Saturday from twenty-nine firms who had abstained from taking part in the lock-out, and who employed about a thousand men. Of these firms, however, ten have since expressed their willingness to grant the eight-hours' day and 10d. an hour asked for by the men, so that only about 650 men, employed by the remaining nineteen firms, have been added to the number to be supported out of the strike funds. Mr. E. Jowett, of Palace-court, Bayswater, who locked out, has conceded the advance, as have also Messrs. Hellis and Turner, of Brompton-road, who have hitherto taken no action.

About four thousand men are now out on strike or locked out, and they were paid on Saturday at the rate of 11s. each per week for non-society men and 5s. 6d. for society men, who also receive 15s. each from their trade-unions.

The strike committee have received this week £190 from the Operative Bricklayers' Society (their first levy), National Association of Operative Plasterers £100, £53 10s. from Manchester and Salford, and other amounts, in all reaching £430 more, from outside districts.

Considering the large number of men involved in the dispute, the charges of intimidation and molestation during the nine weeks the struggle has lasted, have been singularly few. On Monday, however, Thomas Gibson, a carpenter on strike, was committed for trial on bail from the Westminster Police-court, for having threatened a workman named William Hayward, in the employment of Messrs. Mowlem and Co., of Grosvenor-road, Pimlico, one of the three firms at which the strike originally took place. At the same police-court James Curran has been remanded till to-day (Friday) for persistently following Alfred Capps, a joiner in the employ of the same firm, and summonses have been granted against several men on strike, returnable at Marlborough police-court, for molesting men imported from Brighton, and employed by Messrs. Simpson and Co., of Paddington, in Berkeley-square.

It is stated that the joinery for the restoration of the Wesley Chapel in the City-road is being worked at Devizes, where the rate of pay is 7d. per hour.

A strike in the building trade commenced on Saturday at Cambridge. The men seek an increase of wages and a new code of working rules. The masters have offered to meet them on the former, but insist on their own code being followed. About 300 men are affected. At Halifax the plasterers have been on strike for seven weeks for an advance on the 7d. per hour. At the quarterly meeting of the joint committee of the master plasterers of Edinburgh and Leith, and the operatives, it was mutually agreed that the pay of the operatives should be increased ½d. per hour. The increase will take effect on January 4th, 1892. At Warrington, ¾d. rise has been granted, raising the wages from 7¼d. to 8d. At Hull the carpenters have secured from the employers an advance from 7½d. to 8d. per hour as from September 1st, and also revised working rules; and similar advances of a half-penny have been given in Swansea, Gravesend, Darlington, Malvern, Castleford, and Nuneaton, while at Londonderry the hour system has been substituted for that of day labour, the rate of pay agreed on being 6d.

Last week a stained-glass window, designed and executed by Messrs. Barnett and Son, was inaugurated in the Catholic Church of Workington. The window of five lights is over the high altar. The subject is Our Lady Star of the Sea.

WAYSIDE NOTES.

THE public are, naturally enough, nervous just now on the subject of railway bridges. The frequency with which questions are put to the Government in the House of Commons testifies to a certain uneasiness of mind and apprehension of possible evil. Since the accident at Norwood, there has been a rude awakening to the fact you pointed out repeatedly years ago—that railway bridges are not more eternal than any other work of human ingenuity. Sir John Fowler's report to the directors of the Brighton Company has not tended to increase the feeling of security; rather has it done the reverse. It is true that the report suggests that there is no immediate danger in the condition of any of the bridges; but the public will forget this portion of the report, and look only to the fact that some eighty bridges require to be reconstructed within the next two or three years, and that twenty of these should be completed within one year. I daresay that, from this, vast numbers of persons imagine that there are twenty bridges on the Brighton Company's system of lines whose condition is little short of rotten. Such a conclusion, however, is perhaps unjust to the Company. As Sir John Fowler says in his report, the bridges on the Brighton line are neither better nor worse than those on other railways at home and abroad. This, at the same time, constitutes no excuse for delay in making the improvements recommended in the report. Until these are completed, the travelling section of the community will not be reassured. I hope the other companies will not make the holiday-makers pay for the repair of the bridges, as the Brighton Company seem to be doing.

The British public are wonderfully confiding in our engineers, and so long as the confidence is deserved it is a good trait in the national character. I verily believe that patrons would not be wanting for the maddest scheme that could be put forward. There would be a rush for any newly-opened means of transit through earth, air, or water, short of a Jules Verne system of communication between the earth and the moon. From this fact I would deduce the theory that the public of itself would not find out, in good time, weak points in the design of the permanent way of existing railways. It is therefore the duty of those at the head of national affairs to give this question timely consideration. According to a statement of its president, the Board of Trade have no power to order the reconstruction of railway bridges. Sir Michael Hicks Beach contemplates the issuing of a circular to railway companies, calling attention to the matter, but such a step does not seem very drastic. Up to a certain point we may be sure that a railway company would look to the safety of all its arrangements, seeing that otherwise it is incurring additional risks of heavy damages for injuries to passengers. A circular, therefore, would seem of little good. What is really wanted is some inquiry into the behaviour of bridges of various construction under the varying conditions pertaining to railway locomotion. Upon the results of such an inquiry could be founded a set of regulations relating to the methods of constructing bridges of iron or other material. We have Royal Commissions on trivial things enough in these days; why not one on the behaviour of girders of wrought and cast iron under sudden stress and moving loads? All the information at present available on this subject is the result of individual experiment only, and I believe no systematic, official study has been made. In the old days of railway engineering, lack of knowledge of formulæ was compensated by a superabundance of metal in cast-iron girders. Now a little more science is brought to bear on the matter. Yet, from all I can gather, there is little certain knowledge as to the life of iron as a strain-resisting and weight-bearing metal. Into this there should be an inquiry. Given the fact that if we bend a piece of iron wire backwards and forwards it will at last break, how far does this principle affect the life of an iron girder periodically deflected by passing trains? And seeing that in all things mundane the old order changes and gives place to the new, what is the rate of deterioration inherent in the metal iron, both free of outside influences and subject to strains and stresses?

Mr. John Taylor, the sensible, practical, and popular surveyor to H.M. Office of Works, is of our Gothic mind with reference to the sewer ventilators of London streets. Examined before the Committee of the House of Commons with reference to the ventilation of the "House," Mr. Taylor suggested that the foulness of the air was probably referable to the bad state of the atmosphere in the vicinity of the Westminster Palace. The witness described the street ventilators as in a "foul condition." It appears that some time back the old M.B.W. constructed a ventilator somewhere at the end of Westminster Bridge, and it resulted in such a pollution of the neighbouring atmosphere that it was stopped up. Now, irrespective of the ventilation of the Houses of Parliament, what is the consequence of stopping this ventilator? Simply, as was the case when the ventilators near the Stock Exchange were closed—that some other district suffers. The foul air of the sewer cannot get out of the old exits, consequently it finds it way to other openings. In this matter I am of most socialistic views. What is fair to one is fair to another. If the sewers are to be ventilated, let all take their share of the ventilation. When the shafts are constructed here and there, as I have often suggested, then perhaps these gratings would become inlets and cause no annoyance. I was glad to see that Mr. Taylor recommended the construction of a shaft to ventilate the sewers at Westminster. Something on this plan must be done sooner or later, although the necessity has not been very apparent this summer—so far—as we have had such a breezy time of it that London has been almost as fresh as the country.

I suppose that young engineers, like young architects, sometimes combine business with pleasure by looking at works that interest them during their holidays. Any such, then, may find something congenial to their tastes in the Manchester Ship Canal, should they be that way in their vacations. Marked progress has been made at the Eastham section of the work. It is stated that this length of the canal, as far as Ellesmere Port, will be opened towards the end of the present week. Upon the completion of this section efforts will be concentrated on that portion of the canal between Ellesmere Port and Runcorn, with which, also, great progress has been made; and it is hoped that before many weeks are passed communication between the Mersey and Runcorn may be an accomplished fact.

The German Emperor will not think much of our water-engineering. In the Royal Banqueting Hall at Windsor, the other evening, during the progress of dinner, the water-main burst and nearly flooded the hall. There is a humorous side to this occurrence, and we are apt to think that the bursting of water-pipes is an evil pertaining only to the life of a subject, and not to be inflicted upon the Queen and her royal guests. In some countries it would have been no laughing matter to the individual responsible for the condition of the pipe.

How the public may lose by the clearance of insanitary arrears has been demonstrated at Nottingham. The clearance of an unhealthy area in that town, with interest on outlay, &c., has cost the corporation no less than £186,000, making the price of saleable land, exclusive of streets, about £26 per yard. For a site for new post-office buildings, the corporation have only been able to get £4 per yard. From which we may learn that members of the London County Council who advocate the policy of caution in like matters are acting most advisedly, so long, at least, as there is a possibility of making the slum-owners contribute to the cost.

The congress of the British Archæological Association is to be held this year at York, from Aug. 17 to 23. A most interesting outline-programme is announced, and the members of the Association and their friends should have an enjoyable time in the old city. Besides the city churches and the cathedral, there will be visits to St. Mary's Abbey, Beverley Hall, Ripon, Fountains, Selby, Rievaulx, Byland, and Howden, while on the 24th, such of the members of the congress as are not wearied of old architectural remains, will join the excursion to Scarborough and see its old church and castle. The round o the Yorkshire abbeys will be instructive to any architect who, being out that way, might do worse than follow in the train of Oldbucks.

THE NATIONAL PORTRAIT GALLERY.

THE following general notes descriptive of this great work, now in course of erection at the cost of a private donor, have been furnished us by the architect, Mr. Ewan Christian:—"The form of the site, and the line of its boundaries, also the fact that there is a difference in the level of its south-east and north-west corners of more than 8ft., have necessarily determined the division of the new building into two main blocks. The eastern wing is, in fact, a completion of the façade of the National Gallery, treated in the same style as the front of that building. The northern block is on the higher level, and its eastern front 64ft. back from that of the eastern wing, the north-east quoin being set at the extreme northern point allowed by the conditions of the site. The connecting link between these blocks is the entrance hall and staircase, which gives access to each block of galleries, and rises by steps to the higher building. The main block of the Portrait Gallery, facing north, being practically a separate building, is treated in a style allowing of ample window light, which, on a site so limited in area, requiring at least three stories above the ground level, is a matter of absolute necessity, and in respect of outline and general design is based on Florentine and Roman models. As regards accommodation, the eastern wing on the ground story will be devoted to sculpture, for which there is a special entrance, level with the street pavement, the upper story being approached from first landing of main staircase. There will be two useful galleries available for water-colours, miniatures, &c., and over these rooms for photographs and stores. In the main north wing, which, owing to the necessity for deep foundation, has a complete basement story of considerable extent, there are two stories, the upper one being partly devoted to library and curio galleries, cloak-rooms, and heating-chamber, and other necessities, and the lower one to boilers, cellars, offices, &c., also police accommodation, all above the ground level of the courts and areas. On the ground story the eastern portion of the building is devoted to the administrative department, and the western to galleries for various purposes, print-rooms, reading-rooms. From this story to the top galleries provision is made for a passenger lift. On the first floor there will be a series of thirteen cabinets, each 20ft. by 13ft., on either side of a central corridor, and a long, cross gallery, 58ft. by 17ft. all window lighted. On top story, which will be wholly lighted from above, there will be altogether 11 galleries, varying from 58ft. by 17ft. to 16ft. by 15ft., the general width being 20ft. In addition to these there will be repairing-rooms on the two upper stories, with picture-lift from the ground level, service staircase from the bottom basement to the roofs, lavatory and other accommodation, and separate rooms for male and female students. The principal staircase is designed on the Roman and Genoese principle, with intermediate walls and arched ceilings up to the top flight. The ascent will be a perfectly easy one, and the steps fewer in number than in many foreign galleries, with the added convenience of the lift already mentioned for those who prefer to avoid them. The works up to the present time have been carried out under a contract, based on a schedule of prices, by Messrs. Shillitoe and Son, of Bury St. Edmund's, who have also contracted for the shell of the east wing. All the external walling above the base will be executed in Portland stone; the basement of the main building is faced with Cornish granite. Tenders will be asked for carrying up the main block of building above the level, and for the general completion of the interior of the building." We have had the advantage of carefully examining all the drawings, and can speak highly of the arrangements. In front of the main block facing Charing Cross-road will be an inclosure set out with shrubs and flowering trees, and having garden seats, and probably a fountain in the centre, arranged as indicated by the general plan herewith published with the two elevations. The wisdom of adopting Wilkins' lines for the eastern wing at the end of the National Gallery is self-evident, and the semicircular projection in the centre of the new façade not only increases the gallery accommodation of portrait-sculpture and statuary where it is most needed, but it enhances the character of the elevation, and serves to mark the differences in the depth of the projection of the end pavilions. Considerable difficulties had to be overcome in order to avoid interference with the lighting of the galleries of the National Gallery, and this necessitated restrictions of no ordinary kind, limiting the height and planning of Mr. Christian's new building. He has wisely adopted an entirely different type of building, which well contrasts, by its massiveness and breadth of treatment, with the adjoining structure. The required wide area between the two buildings encroached so considerably upon the area of the original site that it was found necessary to take in Hemming's-row, which is now incorporated with the site. A pathway across the inclosure will serve for pedestrians going towards Orange-street. The line marked by * in the east elevation shows the present line of E. M. Barry's addition to the National Gallery. This wall will be considerably lowered.

PROPOSED CHURCH, SUTTON ST. HELEN'S.

WE give the architects' drawing from this year's Royal Academy Exhibition. On plan, the church will consist of nave, five bays long, each 23ft. wide, with a central tower over the choir-stalls. There will be north and south transepts, one forming the organ-chamber, and the other a morning chapel, north and south aisles to nave, with porches on south side, and the clergy and choir vestries on the north side of chancel. The total length of the church is 122ft., and the width across aisles 50ft. The church is to be built with Rainhill stone, the dressings chiselled, and the external and internal facing of walls of broken-coursed scutched work. The roofs to be covered with green Westmoreland slates; the inside woodwork will be mostly of pitch-pine. The erection of the church is now being proceeded with, the sole contractor being Mr. Samuel Webster, of Bootle, Liverpool. The architects are Messrs. Paley, Austin, and Paley, of Lancaster.

MANSION, HILL-STREET, BERKELEY-SQUARE.

THIS house, now in course of erection from the designs of Messrs. J. T. Wimperis and Arber, of Sackville-street, will, when finished, form an effective addition to the architectural attractions of this neighbourhood. The Free Renaissance front is faced with Portland stone and Messrs. T. Lawrence and Son's rubber bricks. The chief feature is the bold projecting bay running up to the second floor, the upper part terminating with a steep gable the full width on the frontage line. The contractors are Messrs. Prestige and Co. Cambridge Wharf, Pimlico.

"SUMMER," FROM THE FRESCO IN THE ROYAL ACADEMY REFRESHMENT ROOM, BY W. REYNOLDS-STEPHENS.

THIS work has been executed as a commission from the President and Council of the R.A. When a student in the academy schools Mr. Reynolds-Stephens obtained the Decorative prize, with the water-colour sketch for the work. This was in '87, and the following year it was exhibited on the line at the Academy. A few words upon the manner of execution may be of interest. This artist, after carefully studying the merits and demerits of the various wall-painting methods, such as tempera, spirit fresco, paraffin-wax, &c., decided to employ paraffin-wax, owing to it being practically unacted upon chemically by anything, and feeling sure that colours incorporated with it would be greatly preserved from atmospheric damage, and would allow of the wall being carefully washed without harm to the work, which is almost impossible by the other methods. The wall is prepared by levelling with coats of finely slaked lime, then an absorbent canvas is fastened upon it with white lead, and the fresco painted with ordinary oil colours, mixed about half and half, with a medium consisting of paraffin-wax, turps, and copal varnish. This causes the surface to go dead or matt.

THE BAPTISTERY, CATHEDRAL, AND LEANING TOWER AT PISA.

THE panoramic view which we print to-day illustrates all three of these monuments of architecture, and between the Baptistery and the Duomo a glimpse is obtained of the Campo Santo, "The Garden of the Dead," which Giovanni Pisano designed in 1278 and completed in five years. The chapel at the east entrance has a dome of later date over it, and this shows in our view. Pisa, the rival of Florence in arts and arms, and next to Assisi, the chief sanctuary of Early Italian painting, is one of the most ancient cities of Etruria. Pliny ascribes its foundation to Pelops, and Strabo says it was founded by the followers of Nestor in their wanderings after the fall of Troy. The Piazza del Duomo, away in the corner of the city, "with its group of buildings clustered in and about this verdant carpet, is perhaps the most beautiful and remarkable in the whole world," said Dickens; and Forsyth adds: "There stand the Cathedral, the Baptistery, the Leaning Tower, and the Campo Santo; all built of the same marble, all varieties of the same architecture, all venerable with years, and fortunate both in their society and their solitude." The Cathedral, the central feature in the picture, was commenced by Buschetto, the architect, in 1064, and consecrated in 1118 by Pope Gelasius II. The plan,* as will be seen by our plate, is a Latin Cross, with a cupola at the crossing. The creamy tint of the white marble of which the church is built is beautiful in its soft tone. The west front is enriched with five tiers of arcades adorned with 58 shafts. Bonnano Pisano's original bronze doors were destroyed by fire in 1596, and the present ones are the work of Giovanni da Bologna in 1602. The central portal represents the History of the Blessed Virgin, and those at the side illustrate the life of our Lord. The church is 311ft. long by 237ft. wide at the transepts, and the nave has double aisles on either side. The two dozen columns of the main arcade were brought from the islands of Giglio and Elba. Those in the aisles came from more ancient buildings, and in most cases retain their original caps and bases. The roof of the nave is of wood, very flat in its pitch. The side aisles are vaulted. The 100 windows are filled with stained glass. The tombs in the cathedral, with its altars and frescoes, are of great interest and antiquity. Many of the pictures, unimportant in themselves, are of eminent value as representing scenes and legends of importance and influence in the history of the place. The Baptistery was begun in 1152 by Diotisalvi. It rises from a platform of three steps—a circular temple of white marble slightly inlaid with blue, after the manner of the Saracens. The second stage of the baptistery was erected as the free-will offering of 34,000 families, who each contributed one "soldo d'oro." The principal light comes from the upper tier of windows on the third story, and the cupola rises to a height of 102ft. from the pavement, and is surmounted by a statue of St. Raniero. The doors are enriched with reliefs from the History of St. John the Baptist. The immersion font stands in the centre. The pulpit, of which we gave an illustration in the BUILDING NEWS for June 1, 1888, is a masterpiece of Niccolo Pisano, rich and beautiful beyond compare. The Leaning Tower, quite as beautiful as it is extraordinary, was commenced in 1174 by Bonnano Pisano and William of Innspruck. The marble walls proved too heavy for the insecure foundations at first used, and so the building settled to such an

* For section and other details see "Edifices de Pise," by Georges Rohault de Fleury, published by Blance, of Paris, 1862.

extent that it leans 13ft. out of the perpendicular. Iron clamps were used to brace the building together, and the centre of gravity is still within the base. Two hundred and ninety-three steps of marble lead to the top of the tower. The Church of "Santa Maria della Spina" at Pisa was illustrated by us in our issue for April 11th last year. An interior of the Campo Santo will be found in our pages for Feb. 15th, 1889.

NAPOLEON THE FIRST'S BEDSTEAD.

THIS bedstead, recently bought at a sale, belonged to Napoleon I., and was purchased at a sale of the Tuileries furniture for 8,000 francs. It is a very fine specimen of the style of the period. The framework is of fine oak, veneered with very beautiful Spanish mahogany. The ornaments are cast in brass, wrought over and highly gilt. They are of considerable artistic merit, particularly the figures and imperial bees. We are indebted to Mr. R. Ward, of 31, Lancaster Park, Richmond, Surrey, for permission to publish this sketch, and also to Mr. W. P. Ryan, of Fenchurch-street, for obtaining the same.

TERRA COTTA. (The particulars as to our Club always appear under this head; and should we recommence its work this year for next season, full particulars will be printed next October. The session 1890-91 will conclude with the illustration and review of the last subject given—viz., "A Lawn Tennis Pavilion.")

CHIPS.

A new Wesleyan chapel at Settrington, near Malton, was opened on Wednesday week. It is Gothic in character, and has a high pitched, open-timbered roof, and is seated in pitch pine for 150 persons. Mr. C. H. Channon, of Malton, was the architect.

A brass lectern, with spiral column, around which three angels are groupe1 to support the desk, has been presented to Milton Church, Hants, as a memorial. Messrs. Hardman and Co., of Birmingham, executed the work.

The parish church of St. Mary, Manchester, a pseudo-Classic building begun in 1754, and consecrated in 1756, is being demolished, being no longer needed for purposes of worship. The churchyard will be reserved as a public open space, and a correspondence is in progress in the Manchester papers advocating the preservation of the tower, which is described by more than one writer as the most interesting steeple in the city.

Probate duty has been paid on £218,549 as the net value of the personal estate of Sir John Hawkshaw, of Holycombe, Sussex, who died on the 2nd June at Belgrave Mansions, aged 80 years. The testator bequeaths to the Institute of Civil Engineers, of which he has been president, £500.

The drill hall at Dumfries, which measures 137ft. by 87ft., is being lighted by the Wenham regenerative gas lamps by Messrs. Henry Milner and Son, of Edinburgh, under the direction of the architect, Mr. A. B. Crombie.

On Tuesday, a meeting was held at the Westminster Palace Hotel, the Earl of Aberdeen in the chair, in advocacy of a scheme for providing residential chambers for young men in London. The site of the club is near Kennington Oval, and plans have been drawn by Messrs. Durward Brown and A. J. Gordon, architects, of Whitehall, to accommodate 438 tenants, providing each with a sitting-room, with bed alcoves, at rents varying from 10s. to 18s. per week, which will include the use of reading, writing, lecture, billiard, and recreation rooms, as well as dining-rooms, where meals will be supplied in common.

The condition of the monument erected in 1817, on the hilltop above the town of Wellington, in Somerset, to commemorate the Battle of Waterloo, has become exceedingly unsatisfactory. A county meeting was held at Taunton on Saturday, presided over by the Earl of Cork, Lord-Lieutenant of the county, to take the matter into consideration. It was resolved to restore the monument at a cost, including the erection of a caretaker's house, of £1,200.

At the Northumberland Quarter Sessions on Friday, a presentation was made to the chairman of his life-size portrait, a work of Professor Herkomer, R.A., together with a replica for the grand jury-room of the Moot Hall, Newcastle.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE BRITISH ARCHÆOLOGICAL CONGRESS. — This meeting will be held at York between August 17th and 22nd. The Marquis of Ripon will preside. The first two days, Monday and Tuesday, will be devoted to an inspection of the cathedral, the city walls, churches, and St. Mary's Abbey, with its Hospice, and its museum of Roman antiquities. One day will be spent in a visit to Beverley Minster, and Hull, another to Ripon and Fountains Abbey, and two days will be devoted to Selby Abbey Church, the Abbeys of Rievaulx and Byland, and the Collegiate Church of Howden. On the Monday evening the party will be entertained at a conversazione at the Mansion-house, and on each of the other evenings meetings will be held in the new Guildhall for the reading of papers, to be followed by discussions. Monday, the 24th, will be spent in an excursion to Scarborough.

THE BRITISH SCHOOL AT ATHENS.—Lord Justice Bowen presided on Friday at the annual meeting in support of the British School at Athens. The hon. secretary, Mr. G. A. Macmillan, read the annual report, which, after referring to the excavation of the theatre at Megalopolis, under Mr. F. C. Penrose's direction, stated that Miss Eugenie Sellers, well known in London as a lecturer on archæology, had been admitted as the first lady student. Messrs. R. W. Schultz and Barnsley, who had returned to England in December, had continued during the past session their valuable work on Byzantine architecture. They might possibly return to Greece in the autumn. The chairman, in moving the adoption of the report, expressed the belief that the fortunes of the British School at Athens are steadily, although slowly, progressing. In order to enable Mr. Ernest Gardner to continue his services to the cause of archæology and of classical study as director of the Athens School in the chair first filled by Mr. Penrose, Caius College had re-elected Mr. Gardner to a Fellowship for a renewed term of three years. The adoption of the report was seconded by Lord Lingen, and unanimously adopted. Mr. Ernest Gardner then read the report of his work during the last year, and Mr. F. C. Penrose gave an account of his work at Athens, which was mainly devoted to the site of Megalopolis. Professor Lewis Campbell moved the election of officers of the school, which was seconded by Dr. Perry, and agreed to.

BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society will be held next week at Moreton and Oxford. The new President (Mr. A. B. Freeman-Mitford, C.B.) will be introduced to the members at the Redesdale Memorial Hall, Moreton, and will deliver his inaugural address on Tuesday, the 14th inst. The members will then visit Bourton-on-the-Hill and Blockley Church, and then go to Northwick Park. The Northwick collection of paintings will be inspected. In the evening a conversazione will be held in the Redesdale Hall, at which papers of local antiquarian interest will be read. On Wednesday there will be an excursion to Little Compton House and Church, and the Elizabethan mansion, Chastleton House, after which the Rollright stones will be described by Mr. A. S. Evans, F.S.A., keeper of the Ashmolean Museum, Oxford. After a visit to Chipping Norton Church, the party will leave for Oxford. Business here will commence on Thursday morning. On Friday, after the business meeting, the members will be received at Worcester College by the Rev. C. H. O. Daniel, M.A., who will read a paper on its history; and at the Ashmolean Museum by Mr. Evans. In the afternoon the members will assemble at New College, and visit other colleges under the guidance of Mr. Parker, and there will be a river excursion to the Norman Church at Iffley.

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.—The annual meeting of this Institute was held on Friday. Mr. Willsher, Pitpoindie, Mr. John Adamson, Mr. James Gold, and Mr. Adam Hunter were elected associates. The report stated that there were now 50 members, 168 associates, and eight honorary members on the roll. The treasurer's account showed that the sum on hand had been reduced from £60 5s. to £41 11s. 4d., due to the increased sum given as prizes. It was agreed, on the motion of the chairman, to affiliate with the Royal Institute of British Architects, the rules of the society being amended so that each member eligible for election should sign a declaration to the effect that he was engaged in architecture, and would not accept any trade or other discounts, or illicit or surreptitious commission or allowances in connection with any works the execution of which he may be engaged to superintend.

PARLIAMENTARY NOTES.

VENTILATION OF THE HOUSE OF COMMONS.—The committee appointed to inquire into the ventilation of the House of Commons met again on Friday. Mr. William Prim, consulting engineer to her Majesty's Office of Works, was recalled, and in further examination by the chairman, the Rt. Hon. David Plunket, described the arrangements for ventilating and warming the committee-rooms and corridors. The air, he said, was taken in from the terrace through the area at the bottom into a chamber, whence it passed along into a passage, and so to the heating apparatus, from which the air passed into the committee-rooms through the floors and skirtings, and in some places through a grating at the back of the chairman, the air coming into the corridors leading to the committee-rooms underneath the seats. The vitiated air passed through the ceiling by a shaft to the Victoria Tower, at the base of which there were two furnaces for the purpose of creating a draught. Bad air could only get back into the other rooms if there was a down draught from the main vitiated air-shaft, which occasionally happened when a strong wind was blowing. A back draught could be obviated by placing in valves such as had already been used in some cases. The witness promised to prepare a plan showing where he would recommend that these valves should be placed. The witness explained the difficulty there would be in letting an increased quantity of air into the reading and tea-rooms without causing a draught. A smell resembling sewer gas was complained of; but this came from the sulphurous fumes of passing barges, and not from the sewers. This opinion was confirmed by Mr. Jones, clerk of the works to the House of Commons. On Monday Mr. John Taylor, surveyor to Her Majesty's Board of Works, was examined before a committee of the House of Commons as to the ventilation of that building. He said that he did not think it possible for any gas from the public sewers to get into the drains of the Houses of Parliament; but he added that the ventilators from the main drainage system in the vicinity of that building were in a most foul condition, and this ought to be remedied. The sewers running immediately outside the gates of New Palace-yard were, he said, the worst, although they were under the control of the County Council.

LOANS FROM THE NATIONAL GALLERY.—In reply to Mr. Lees, Mr. W. H. Smith said there were objections to the proposal that the trustees of the National Gallery should be recommended to arrange for the interchange by provincial art galleries of the collections lent to them by the National Gallery under the National Gallery Loan Act, on account of the extra risk thereby incurred, and also on the score of expense, as the National Gallery has no funds at its disposal from which the carriage, packing, and insurance of the pictures could be paid.

PUBLIC HEALTH (LONDON) BILL.—This measure passed second reading in the House of Lords on Tuesday. Viscount Cross explained that it is partly a consolidation Bill and partly an amending Bill. At present there are no fewer than 29 Acts of Parliament dealing with the subject, while the Public Health Act of 1875, which applies to the provinces, and which contains many excellent provisions, does not apply to the metropolis. The Bill contains new provisions with regard to the removal of nuisances, offensive trades, smoke, the removal of refuse, the regulation of workshops and bake-houses, the notification of infectious diseases, together with provisions to do away with the existence of underground rooms. Sanitary inspectors are given large powers for the enforcement of the law, and the Bill provides for the punishment of sanitary authorities themselves who fail to carry out the duties imposed on them.

A retired carpenter and builder, at Burford, Oxon, an octogenarian, named James Wickins, attempted suicide on Saturday by cutting his throat. He is likely to recover.

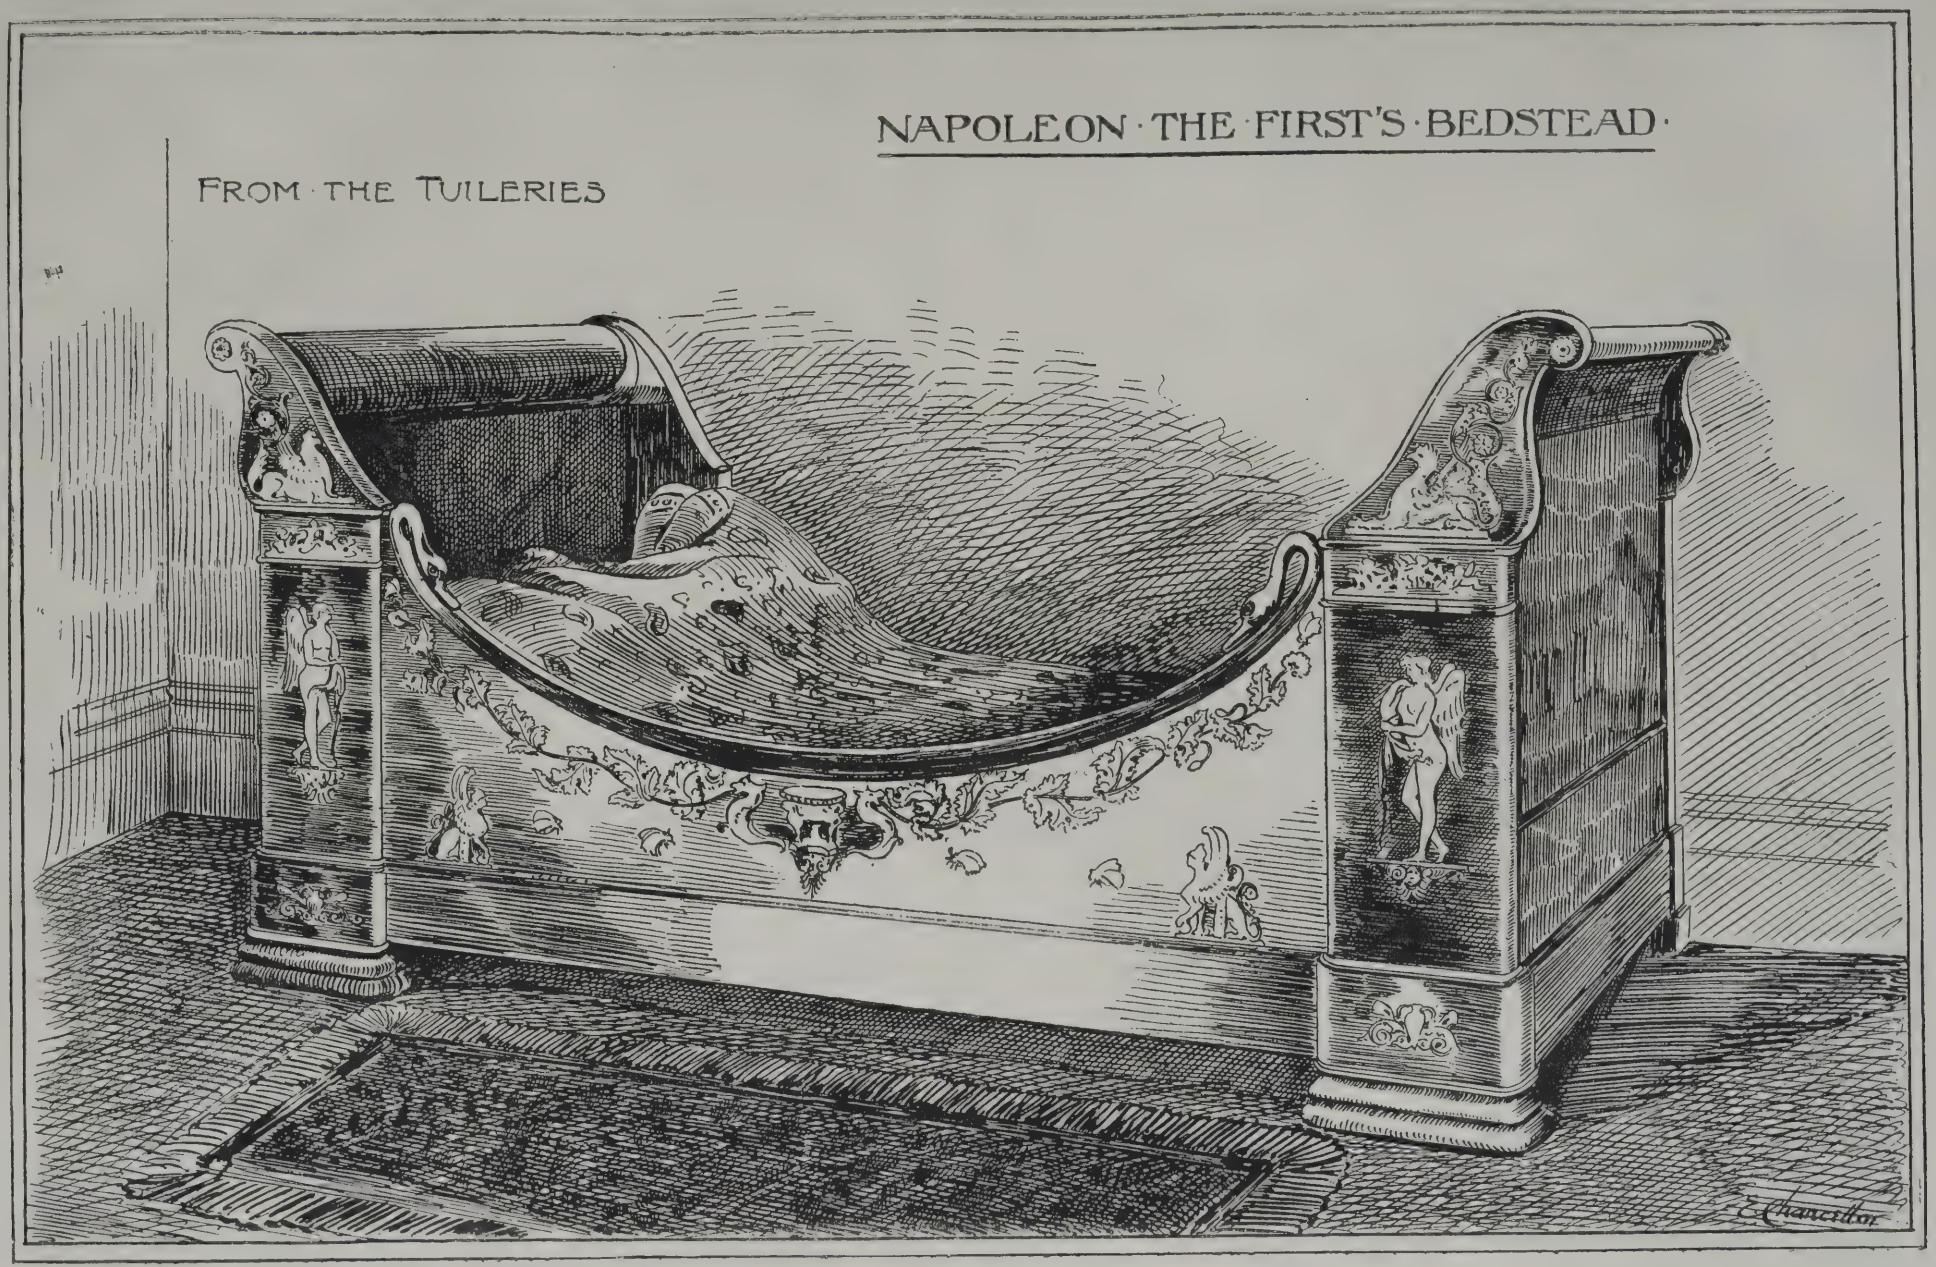
At the last sitting of the Edinburgh Dean of Guild Court, a warrant was granted to the kirk-session of St. Cuthbert's Parish Church, Edinburgh, to reconstruct the building, the architect being Mr. Hippolyte J. Blanc, of Edinburgh. It is not intended, unless funds permit, to complete the campaniles on the eastern towers, though, for the sake of effect in a building occupying so prominent a site, the court expressed the hope that the design would be carried out in its entirety. The building area has been inclosed, and estimates for the foundation excavations have been obtained, so that in a few days operations will be proceeded with.

MODEL OF A FOUNTAIN AT THE ROYAL ACADEMY.

MODEL OF A FOUNTAIN AT THE ROYAL ACADEMY.

THIS fountain model, which forms the central object in the Octagon Hall at the Royal Academy Exhibition, is from a sketch furnished by the artist, Mr. G. W. Wilson.

SANITARY FITTINGS AND THEIR APPLICATION.*



NUMEROUS treatises by patentees and others have issued from the press on sanitary matters, but these have been prompted more by a desire to recommend certain systems and specialities, than to instruct the public. Mr. Robert M. Wharam, sanitary engineer, of Marlborough-road, Chelsea, has brought out a little book of "Hints on Sanitary Fittings," for the benefit and use of owners of house property and others interested in healthful buildings, which gives, in the compass of 30 pages, the principles that ought to be observed in the construction of dwellings; and with this object Mr. Wharam takes a London house of the average rental of about £50, and shows how the drainage and fittings should be carried out. The danger of sewer-gas in connection with our system of metropolitan main drainage is referred to as being the grave mischief to be guarded against. To prevent the entrance of the sewer-gas into the house, a water-trap between the house and sewer is the primary essential; in other words, a water-tight chamber should be constructed to allow of easy cleansing and inspection. Such a disconnecting chamber is now generally constructed to all good houses; every dwelling should have one, but this is far from being the case. The author illustrates a good form of stoneware disconnecting trap for this purpose, which is joined to the drain-pipe. The connection between the inner portion of main drain and the trap is by an open channel-pipe, so that any gas can find free escape. As a means of ventilating the chamber, a vertical pipe with a mica air inlet valve may be introduced, which, while admitting fresh air, prevents the escape of sewer-gas. Here the author illustrates the inlet and an air-tight movable cover of cast iron for the chamber. Several useful hints are given about the waste-pipes, drain-pipe laying, junctions, and jointing. The second inspection chamber at the highest point of main drain is similarly constructed with flow and open channels to receive branch drains and soil-pipe. Mr. Wharam points out the great care that ought to be exercised in the selection of the fittings, and he describes and illustrates a combined w.c. apparatus with wash-down basin and trap, urinal and slop sink. The seat is a hinged self-raising one. Engravings of basin and trap, flushing cistern with siphon action, are given, and the mode of fixing the same, the soil-pipe, and its ventilation. The servants' w.c. and flushing cistern arrangement, an improved bath without the objectionable casing of wood, and the "combined overflow, waste, and trap" are fittings no less important that are described. Illustrations are given of gully-traps to receive waste from bath, lavatory, and rain-water drain, a lavatory basin, and flush tank, and the author briefly sums up the chief points to be observed as follows:—(1) The main drain of about 6in. diameter, having a sufficient down grade to sewer, and as straight as possible; (2) two inspection chambers near external walls outside the house—one at the highest portion of main drain and one at the lower side, with intercepting trap; (3) an inlet for fresh air to the lower chamber, and an outlet from the higher portion of drain carried above roof—practically a siphon inverted; (4) to use w.c. basins and traps of well-glazed earthenware, and of simple construction; (5) to have all wastes from baths, lavatories, sinks, &c., trapped, with provision against siphonage, and generally to have all plumbers' fittings easily accessible, and to avoid unnecessary casings. We recommend Mr. Wharam's sixpenny *brochure* to the careful perusal of every architect, builder, and house-owner.

* Hints on Sanitary Fittings and their Application. By Robert Marr Wharam. London: H. and W. Brown, Fulham-road.

St. Peter's parish church, Claypole, Lincolnshire, is about to be restored at a cost of £3,000. Mr. C. Hodgson Fowler, F.S.A., of Durham, is the architect, and the contractors are Messrs. Close, of Lincoln.

NAPOLEON THE FIRST'S BEDSTEAD

FROM THE TUILERIES

PRICES.—IX.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

CHIPS.

At a vestry meeting held at Uphill, near Bristol, it was decided to rebuild and enlarge the chancel of the parish church and reseat the nave, at an estimated cost of £1,000.

The work in connection with the extension of the infirmary at Warrington has been commenced by Messrs. Gibson and Sons, contractors. A new building will be erected on an adjoining plot of and in the gardens purchased from the corporation. The cost of the new building is estimated at about £2,000, and the work is to be completed by the 30th November. The plans have been prepared by Mr. Wm. Owen, architect, Cairo-street, Warrington. Great improvements have been made in the old buildings from Mr. Owen's designs.

The will of Mr. James Fennings, formerly of Fennings' Wharf, Tooley-street, and of King's-road, Clapham-new-park, and late of 2, Park-place, Eltham, granite merchant, who died on May 26th, has been proved, the value of the personal estate amounting to over £11,000.

The conversazione of the Institution of Electrical Engineers was held on Monday evening in the galleries of the Royal Institute of Painters in Water Colours, Piccadilly. The company were received by the president, Professor Wm. Crookes, F.R.S., and Mrs. Crookes. There was a very large attendance.

Mrs. Burne-Jones appeals to art collectors to lend their pictures during their absence from town to the South London Fine Art Gallery in Peckham-road, Camberwell. "Simple subjects, bright landscapes, and portraits of well-known persons" are specially welcome. Letters can be addressed to the Secretary, South London Art Gallery, Camberwell, S.E.; or to Mrs. Burne-Jones, The Grange, West Kensington, W.

The Metropolitan Asylums Board have, by 28 votes to 23, shelved *sine die* the consideration of a committee's report that offices should be built for the Board on a freehold site next to the London School Board offices on the Embankment, now occupied by Gwynne's factory. The estimated cost of the site would be from £30,000 to £40,000, and of the building itself another £20,000.

Among the measures which received the Royal assent on Friday were the London Sky Signs Bill and the London Overhead Wires Bill.

Mr. Charles Kirk, of Sleaford, who has just retired from the office of county surveyor for Kesteven, Lincolnshire, has been appointed a Justice of the Peace for that division.

Building Intelligence.

Camborne.—New public buildings in Trevenson-street, Camborne, were opened recently. The plans were drawn by Mr. Silvanus Trevail, M.S.A., of Truro, and the contract was let to Mr. James Julian, of Truro, at £3,500. The design is Norman in character, and the very plain structure has a front of granite and elvan. Its total length is 112ft., its width 57ft., and height 22ft. to tie-rods. The chief hall will seat 1,500 persons, and is the largest in Cornwall. The walls of buildings are all of elvan, with the exception of the front, built with hydraulic mortar, and with red brick dressings. The height to the apex of roof is 50ft., and the walls are 34ft. in height. Boyle's patent ventilators are used. On the ground floor is provided a suite of commodious rooms, to be utilised as a club. Entrance to the hall is gained by four staircases, two in the front and two in the rear, and formed of concrete carried on iron girders, with iron balustrades. The stage is 18ft. deep and 35ft. wide. In front of it is an elliptic proscenium arch, with a span of 25ft., constructed of 14in. brickwork and cement, and provided with a water curtain. Running round two sides and the end of the hall is a wide gallery. The internal fittings are all in the Elizabethan style, worked in pitchpine.

Knowle, Bristol.—A mission church, dedicated to St. Martin, was opened at Upper Knowle on Friday, in connection with the Church of the Holy Nativity. The mission church is built of wood, and consists of sanctuary and open nave, and the flooring is laid with wooden blocks. As regards construction, the church is a novelty, and protected by the patent laws. It admits of being readily removed, and, as regards the main building, requires no scaffolding for its erection, and it affords facilities for enlargement at any time at slight cost. It is 42ft. in length, 20ft. 6in. in width, and 21ft. to the apex of the roof. It has a south porch and entrance, and a shingled approach. The eastern and western windows, and the spandrels to the buttresses, are filled with tracery. The building accommodates about 150 persons. The work was executed by Mr. Job Stanley, of Broom, Worcestershire, from the designs of the inventor, Mr. William Jeffrey Hopkins, diocesan architect of Worcester. It was framed at Broom, and afterwards forwarded and erected upon the spot. The proportions will be improved when another bay is added to the length for the purpose of meeting the future necessities of further accommodation.

Romford.—At the last meeting of the Romford School Board, an account was submitted by Mr. Hudson, the architect in connection with the enlargement of the Albert-road Schools, amounting to £79, and included an item of three guineas for professional advice. This, it was explained, was a sum paid by Mr. Hudson to Mr. E. R. Robson, F.S.A., the consulting architect of the Education Department, and the Clerk produced the receipt for the amount. The Rev. F. Sweet said it was a question whether the board ought to pay it. It was an iniquitous thing that after employing a competent architect to prepare plans they should have to pay a fee to the Department's architect. Mr. Booth said he understood the consulting architect to the Department received £700 a year. The Clerk mentioned that a difficulty had been experienced by the Hornchurch Board in getting the plans of their proposed new schools passed by the Department.

Waterford.—The Cathedral of the Blessed Trinity was reopened on the 26th ult., after restoration and improvements. The cathedral was re-erected from designs by John Roberts in 1773, and in the present works the Classic style in which Roberts wrought has been respected. The galleries have, however, been removed, the lower corridors blocked up, and the building is now lighted from a clerestory range. The cross wall and gallery, which almost shut off the nave from the choir, have been removed, and an arch thrown across the opening, while the organ has been removed to the side of choir, in which have been erected clergy and choir stalls. These fittings are of solid oak. As the Gothic style could not be followed, the architect has gone for inspiration to the Classic choir inclosures of churches in Italy, and the details and sculpture have been modelled on these examples. A low marble wall marks the western limit of the choir. The altar rails, of gilded wrought iron, were executed by Messrs. Singer and Sons, of Frome. The chancel floor has been relaid with Italian mosaic by Messrs. Oppenheimer. Architraves have been added to the windows throughout; and these, formerly mere apertures in the walls, have been fitted with mullions and cathedral glass. The architect for the restoration is Mr. Thomas Drew, R.H.A., of Dublin; Mr. A. P. Sharpe, of that city, was the contractor; and the carving was executed by Mr. Henry Emery, also of Dublin. The outlay has been £4,000.

Yaverland Church, Isle of Wight.—The chancel of this church has been greatly enriched by the munificence of the vicar, the Rev. J. N. Palmer, with stained-glass windows by Mr. E. Frampton, Buckingham Palace-road, and an elaborate reredos of alabaster, extending the whole length of the east wall, the central portion behind the altar having a sculptured representation of Our Lord in Majesty, with groups of adoring angels on each side, under an open-traceried canopy flanked by niches containing statues of Ezekiel and St. John the Baptist, the buttresses forming the divisions being surmounted by angels with musical instruments. The side panelling, from the reredos proper to the north and south walls of chancel, contains double rows of niches filled with carved angels holding the emblems of the Passion, and figures of the four Evangelists in mosaic with much open tracery and carving in the surroundings. This reredos has been executed by Earp and Hobbs, of London and Manchester, from the design by Mr. C. E. Ponting, architect, of Marlborough, and is of a Late Perpendicular character.

Engineering Notes.

The West Highland Railway.—The difficulties that lately sprang up between the West Highland Railway promoters and the contractors, Messrs. Lucas and Aird, have not been surmounted, and on Saturday the latter dismissed other fifteen hundred of their hands, bringing up the total number dismissed to three thousand. Comparatively few men are now engaged in constructing the line, and it is believed that these will be dismissed next Saturday. The contractors paid the fares home of those workmen they had brought from the Highlands and Western Isles. Throughout the route of the line the greatest regret is felt at the stoppage of the work.

COMPETITIONS.

The Birmingham New General Hospital.—The committee have appointed Mr. Waterhouse, R.A., as consulting architect for the building of the new hospital. They have also considered, but have not yet finally decided, the terms of the limited competition for designs and plans, and the list of architects who are to be invited to take part in the competition.

CHIPS.

The new headquarters of the 2nd W.Y.V. Royal Engineers, Leeds, was opened on the 4th inst. The design has been prepared and carried out under the supervision of Mr. William Bakewell, architect (an ex-officer of the corps). Mr. Joseph Pullan is the contractor, and Mr. Charles Goulden has acted as clerk of the works.

The corner-stone of new Sunday-schools for Pencoys, Wendron, was laid on Friday. Mr. Kistle, of Fourlanes, is the builder.

At the Birmingham Bankruptcy Court, William Wake, of Moseley, passed his examination. The debts amounted to £342, and the assets £2. Bankrupt, who had been a publican, admitted that he started in business as a builder with £10 capital, which was then owing for goods.

The Rochdale town council have had a long discussion upon a resolution declaring that corporation contracts should only be given to employers who paid the standard rate of wages. Ultimately the resolution was defeated by a large majority.

The appointment of a surveyor to the estates of the Skinners' Company is announced, Mr. E. H. Burnell having resigned after 30 years' service. Applications are to be sent in to Skinners' Hall, Dowgate-hill, by Tuesday next, the 14th inst.

The Northwich board of guardians have adopted a plan by Mr. Cawley, architect, for new receiving wards to be added to the workhouse.

STAINED GLASS.

South and North Tynedale.—Several stained-glass windows have recently been inserted in churches in South and North Tynedale. A stained-glass window has just been placed in the Haltwhistle parish church to the memory of the late Mr. Joseph Gordon, M.Inst.C.E., a native of that place, and for many years borough engineer of Leicester, and who, it will be remembered, died shortly after being appointed engineer to the London County Council in the autumn of 1889. It has been erected by his widow and children. In Beltingham church, near Bardon Mill, a stained-glass window has been erected to the memory of the late Mr. Lowes, of Allen's Green, by his widow. Three memorial stained-glass windows have been erected in the north transept of the interesting old church of St. Michael's, Warden, by Mr. N. G. Clayton, of the Chesters, to the memory of three uncles. Other two stained-glass windows have been erected in this church. One of these is to the memory of Richard Clayton and his wife, and is erected by their three surviving children. The other has been put in by the servants on the Chesters estates, and is dedicated to the late Mr. John Clayton.

LEGAL INTELLIGENCE.

Architects' Commission for Unexecuted Works.—Eedle and Another v. Alston.—In the Court of Queen's Bench on the 1st inst., before the Lord Chief Justice and a jury, this action, by a firm of architects for fees and sums, &c., paid out, and by quantity surveyors for taking out quantities, was tried. The claim was for architects' fees, £176 11s., and for surveyors of quantities, £183 19s. 6d.—total, £360 10s. 6d. The defence was that the plaintiffs had been employed to make plans for certain work, the expense of which was not to be above £2,000, but that, in fact, it was found that it could not be done under £4,779, so that the plaintiffs' services were wholly useless to the defendant, and nothing was due to them. The plaintiffs carry on business near London-bridge, and in October, 1889, the defendant, occupier of the Prince of Wales Hotel, Paddington, instructed Mr. Eedle to prepare plans for alterations in the house. Mr. Eedle stated that defendant, who was accompanied by his son, said nothing as to the expense, or as to any limit of expense, though as they were going away the son said, "I suppose the expense will be about £2,000," to which, however, Mr. Eedle said he replied that it would cost much more. In the correspondence, however, it appeared to be admitted that the defendant had mentioned £2,000 as the amount he could afford to expend; but it was asserted that there were subsequent alterations which would greatly increase the expense. The alterations at first contemplated, it was admitted, could be done for £2,000, though the parties differed as to whether that sum was mentioned as a limit. But other works were suggested, and the plaintiffs prepared further plans, which were not approved by the County Council, and new plans were prepared, of which, according to the plaintiffs, the defendant approved. Upon these—to ascertain the expense—the plaintiffs employed quantity surveyors, and the quantities were taken out, upon which builders made tenders for the work, the lowest of which was £4,779, on which the defendant threw up the design, but employed another architect, and did certain works to the amount he had contemplated. The plaintiffs claimed for the charges of the surveyors who had taken out the quantities, and also claimed their commission of 3 per cent. on the estimated expense of the works done. The defendant disputed his liability to pay anything. Lord Coleridge said the plaintiffs, no doubt, were entitled to recover something, but they could not be permitted to recover by way of commission on the estimated expenditure. That was a claim which architects might consider reasonable, but which they had never been allowed to enforce. They could only in such a case recover a reasonable remuneration. The plaintiff, Mr. Eedle, gave evidence in detail as to the work he had done on the plans and drawings. A drawing was made, exhibiting an altered front.—Mr. Winch, for the defendant, said his client had throughout said the work must be done within £2,000, and as to the front, he had positively directed that it should not be touched.—Lord Coleridge: But what was the use of saying that in the face of these drawings and plans? I am afraid, Mr. Winch, your client must pay—I do not say all that the plaintiffs claim, but what the jury may consider reasonable. The plaintiffs sent in their charge at the rate of 3 per cent. on £4,779, and the sum paid for quantities. The defendant refused to pay this, but offered 3 per cent. on £2,000, though he refused to pay for the surveyor's "quantities." The plaintiffs offered to submit the matter to the defendant's solicitor and architect, but this was declined, and this action was brought. Witness admitted that the original plan could have been carried out for less than £2,000. Asked how the estimated expense had grown to nearly £4,800, the witness said he had given no estimates; there were many additional works.—

Mr. Franklin, of the firm of Franklin and Andrews, the quantity surveyors employed by the plaintiffs in this case to take out quantities, deposed that his charges were £183 19s. 6d., some of which was for lithography.—Mr. Winch, for defendant, said he did not dispute that the plaintiffs had done a good deal of work, but the defendant had derived no benefit from it. The preparation of plans for an expenditure of nearly £5,000 was wholly useless, and worse than useless, to the defendant, who was not bound to pay for services which had done him no good. The defendant said he had told Mr. Eedle that he desired to expend £2,000 on the house, and explained to him what he desired to be done. He said that good alterations could be made for the sum mentioned, and he would prepare plans. In cross-examination he said he at one time was willing to pay 3 per cent. on £2,000, but that was to avoid litigation. The son was called to confirm his father as to the £2,000.—Mr. Atkinson, in reply, urged that the defendant had not set up any agreement or guarantee by the architect that the expense would not exceed £2,000; and the architect was not bound to inform his employer that there would be an increase of expense. The question was not raised as to the reasonableness of the amount claimed, as the defence was that nothing was due. —Lord Coleridge told the jury that the plaintiffs were clearly entitled to recover the surveyors' charges, which were reasonable. As to the architect's own charges, he objected on principle to a percentage on an amount not expended, and the question would be what was a reasonable amount. But in some cases it was difficult to make a charge in any other way, and here the commission charged was small, and the amount did not appear to be unreasonable. As to the defence set up, the work had been done, and apparently well done, and the defence was that it was of no use to the defendant. But he knew it was done, and done for him. He set up, indeed, that there was an agreement that the expense should not exceed £2,000—that is, that there was a guarantee to that effect, for if it did not come to that, it was nothing. The reasonableness of the charges was not disputed; the only question raised was whether anything was due. The jury asked whether the surveyors' charges should be additional to the architects', or rather not included in them; and one juror pointed out that £360 was 8 per cent. upon £4,779. Lord Coleridge said the reasonableness of the charges was not disputed. The sole question was whether the special bargain had been made—that the expense should not exceed £2,000. The defendant did not dispute that: if he owed anything, he owed £360 10s. 6d. After some further consultation, in which it appeared that one juror dissented from the others, they agreed, and returned a verdict for the plaintiff for the full amount claimed—£360 10s. 6d.

CHIPS.

A new organ, erected at a cost of £220 by Messrs. Foster and Andrews, Hull, was opened on Friday in All Hallows' Church, Sutton-in-the-Forest.

The will of Mr. Thomas Henry Hovenden, formerly of 181, Bishopsgate-street Without, and late of Arbor End, 153, Selhurst-road, South Norwood, surveyor, who died on the 5th inst., has been proved, the value of the personal estate amounting to upwards of £41,000.

A very ornate new pulpit was dedicated on Wednesday last in the parish church of Stoke Fleming, being the munificent gift of a resident in the parish, having cost £300. It is entirely of oak, and was executed from the design of Mr. Edmund Sedding.

Holy Trinity Church, Platt, Rusholme, which has been undergoing restoration, will be reopened on the second Sunday in August.

At the Somerset Quarter Sessions, held at Taunton on Wednesday week, George Henry Price, surveyor, was convicted on a charge of obtaining from Samuel David Kennard, a builder, a cheque for payment of £10 4s., and warrants of other acceptances and bills. Prosecutor, a builder, requiring more money to complete a contract, went to prisoner, who gave him bills which were dishonoured. Prisoner was sentenced to six weeks' hard labour.

In former days the parish church of St. John the Evangelist, Leeds, the fine screen was surmounted, on both its northern and southern parts, by a striking cresting inclosing the Royal arms and the Prince of Wales's feathers. This was removed many years ago, but Mr. Wurtzburg subsequently purchased as much as he could find of the old work at a broker's, with a view to its eventual restoration, and has now at his own expense replaced the casting in its original position. The places of the Royal arms, which are now set up at the west end of the church, have been filled with Christian symbols, designed by Mr. Temple Moore, architect, of Hampstead. The work has been carried out by Mr. Horsman, of Mark-lane, and the carving executed by Mr. Hirst, of Infirmary-street.

Our Office Table.

THE detailed programme of the Society of Architects' forthcoming excursion to Belgium, just issued, gives promise of a very enjoyable trip for the M.S.A.'s and their friends. The meetings extend from the morning of Saturday, August 15th, to Saturday evening, August 29th; but to meet the convenience of those who cannot be away a fortnight, the tour is arranged in two portions, the first extending from the 15th to the 24th prox., the second from the 22nd to the 29th. The party leave Charing-cross Station at 10 a.m. on the 15th, and cross from Dover to Ostend, where they will attend, the same afternoon, an audience to be granted by the King of the Belgians. In the evening the members proceed by train to Bruges, where the Sunday will be passed. Monday, the 17th, will be spent in Bruges, and Tuesday at Ghent, Wednesday at Antwerp, Thursday at Malines, Friday at Louvain, and Saturday and Sunday at Brussels. Monday, the 24th, will be devoted to Mons, Tuesday to Tournai, Wednesday to Audenarde, Thursday to Courtrai, Friday to Ypres, and on Saturday the return journey will be made from Ostend, Charing-cross Station being reached at 5 p.m. The tickets for the excursion for members or friends, which must be obtained before August 1st, are granted at the following rates: —For the whole tour, £12; for the first portion, £9 10; and for the second portion, £8 5s. These very reasonable fares include travelling (first-class boat and second-class rail), hotel expenses, porterage, sight-seeing, and the conductor's fees.

AN heraldic exhibition, promoted in connection with an archæological congress to be held in Edinburgh next month, was opened on Monday at the National Portrait Gallery by a conversazione. In all about 200 persons and corporations have lent articles to the committee, and the display is artistically arranged. Many banners reputedly of great antiquity are shown, including a piece of sage-green silk said to have been carried by the son of the second Earl of Douglas at the Battle of Otterburn, in 1388. Facsimiles of the great seals of Scotland and England since the 12th century, and of all the burghs of Scotland (with the singular exceptions of those of Edinburgh and Glasgow) are shown. The Queen has lent some heraldic MS. and an heraldic roll of the time of Edward III., while the insignia of the various orders of knighthood have also been obtained on loan. Hanging on the walls, with 99 seals dangling from it, is the protest of the nobles of Bohemia, addressed to the Council of Constance in September, 1415, against the burning of John Huss and Jerome of Prague. The grant of arms by "Jehan Smert, Garter, to the Tallow-Chandlers' Company of the City of London," dated 24th September, 1454, is supposed to be among the oldest English grants in existence; and among the Scottish documents of the same description are patents of arms to Sir James Balfour of Pittendrich in 1566, and to Lord Maxwell in 1567. Both are signed by "Adam M'Cullot, Marchemont." These old parchments also include an appointment by Cromwell of Sir James Campbell to be Lyon King-at-Arms (1658). The exhibition is open to the public free of charge.

OUR attention has been drawn to a matter which, if substantiated, seems to us to be about as discreditable an affair as we have ever heard of in connection with business. We are informed that some person has been in collusion with an employé of Messrs. Robert Boyle and Son, and obtaining copies of their plans and estimates for the ventilation of buildings, which have been illegitimately utilised. We observe that Messrs. Boyle have offered a reward of £100 for the discovery of the guilty parties, and we trust they will be successful in unearthing them, and inflict upon them the punishment such conduct deserves.

THE following are the awards at University College in architecture (Professor T. Roger Smith, F.R.I.B.A.):—Fine Art: Donaldson Silver Medal, A. E. Kirk, of Leeds; prize, W. E. Hazell, of London; certificate, 3, T. G. Lucas, of Hitchin. Second-class: H. E. Church, of Clapham; H. E. Matthews, of London. Construction: Donaldson Silver Medal, H. C. Corlette, of Sydney; prize, G. Gonsalves, of Trinidad; certificates, 3, W. H. H. A. Kettle, of Brentwood; 4, F. K. Kendall, of Blackheath. Third class: W. J. Keith, of Ealing; E. Lyon, of Valparaiso; P. E. Newton, of Sydney; E. H. Terry, of London; R. M. Whellock, of Nunhead. Modern Practice: Prize, J. Borrowman, of Godalming. Third class: T. H. Bishop, of Leighton Buzzard; C. W. Dawson, of Croydon.

ANOTHER of the ancient landmarks of Bristol, the old Redland Manor House, is, says the *Western Morning News*, to be dismantled and cleared away to make room for a building site. The manor house was built in the year 1658, and the ceilings of the older portion of the building are ornamented by splendid designs, having carved panels and elaborate mouldings in geometrical patterns. The fine old chimneypieces, richly carved in stone, have been sold to Mr. H. A. Forse, contractor, and will be taken down in the course of the next few days. Two of these chimneypieces have carved upon them the initials "F. G.," and the date "1658." The sundial, which stood in the grounds, is now in the possession of Mr. T. D. Sibly. For many years the house has been occupied by Mr. John Reynolds, a well-known archæologist. The house will be open for inspection during the next fortnight, after which it will be cleared away.

ON Saturday last several members of the Masonic literary society, the Quatuor Coronati, had their annual outing. The train stopped at Sole Street, and the party proceed to Cobham church, where the brasses were inspected, and a paper read on them and the building by Mr. W. M. Bywater; thence to the Leather Bottle, associated with Dickens, followed by a four-mile walk through Cobham Park to Rochester to inspect the castle and the cathedral. At the latter the Rev. Fielding read a paper, and Mr. H. Lovegrove made some remarks on the former roof.

THE local district council for Bristol, in connection with the National Registration of Plumbers, held an examination at the Merchant Venturers' School in that city, on Saturday, when candidates attended from Bristol and various parts of Gloucestershire and Wiltshire, and were examined in the theory and practice of the trade. Sixty per cent. of the candidates succeeded in passing the full examination qualifying for registration. The examiners were Mr. T. S. Pope, architect; Messrs S. Sydenham (Bath) and J. H. Holbrook, master plumbers; Mr. T. J. Edmunds, journeyman, and Mr. W. H. Perry, assistant hon. secretary.

A meeting of the district council for South Hants and the Isle of Wight of the Society for the National Registration of Plumbers was held at the Municipal Offices, Southampton, on Thursday in last week, Mr. Sheriff Bone, J.P., in the chair. Five candidates were recommended for registration as the result of the examination recently held in Southampton.

A memorial, signed by many men of science, art, and letters, was forwarded on Tuesday by Sir H. Roscoe, M.P., to the Lord Mayor, praying that the Corporation of the City of London would grant a site on the Embankment for the New English Art Gallery about to be erected at the sole cost of Mr. Henry Tate, and for which a site adjoining the Science Collections at South Kensington has been promised by the Government.

At Tuesday's meeting of the water committee for Liverpool, it transpired that whilst from five to six million gallons daily are being discharged into the pipes at Vyrnwy less than two million gallons reach Prescot. The balance of about four millions is lost by the way, mainly, it is supposed, at the temporary tube laid across the bed of the Mersey at Fidler's Ferry, Warrington. Mr. Deacon, the engineer of the works, is at present engaged on an important arbitration arising out of the construction of the original tunnel under the Mersey, built by Messrs. Newell and Monk, and the committee resolved to defer further discussion until Mr. Deacon is at liberty to deal with the matter.

At the last meeting of the town council of Colchester, the Museum Committee reported that they had considered the desirability of identifying such houses or buildings as possess historical associations for the information of visitors and inhabitants of the borough, and recommended that the committee be empowered to place suitable tablets upon any such buildings as they might deem worthy of such notice, with permission of the owners and occupiers. The report was adopted. At the same meeting it was decided to have a conference by this committee with three members to be appointed by the Essex Archæological Society, as to the future management of the museum in the castle.

FRIDAY, JULY 17, 1891.

NEGLECTED STUDIES.

THOSE in full practice as architects often lament their ignorance, or, rather, want of expertness, in many branches of their vocation. They look back on the years that have passed with a feeling of dissatisfaction that they have neglected many studies that would have been of incalculable value to them. We suppose everybody and every professional man in every vocation can regret their lost opportunities—the fact of the matter being that those who are articled and follow a profession, no matter what it is, are confined to a conventional groove or class of practice which gives them few opportunities of following side or collateral branches of their profession. To a certain extent, a scheme of architectural education and an examining test will supply this deficiency by guaranteeing a more complete education to the architect, though it will guarantee only to him so much theoretical or textbook knowledge as will be sufficient to pass by a sort of cramming process, but not that intelligent acquaintance with facts and principles which is really, after all, the possession of an educated mind. Still, against all that can be urged to lessen the advantages of a scholastic *régime*, it has the decided merit of not allowing valuable knowledge to be neglected.

What are the branches and studies most generally neglected by the architect? These, of course, will depend upon his training and opportunities. A young man in a borough surveyor's or engineer's office will pick up a great deal of the practical and useful, and become more of an "all-round" man in his profession than he who has served his articles with a London architect in large practice. This goes without saying. He will probably know something of surveying and levelling, building by-laws, drainage and sanitary work, all of which things the young London pupil knows nothing at all about, or if he does, only superficially. On the contrary, the London pupil will necessary become a better and more expert draughtsman than the provincial student, and have a knowledge of one or two styles, and perhaps the requirements of a certain class of buildings, so that it will entirely depend on the office routine and experience of each. We are not going to say that each of these differently conditioned pupils would be better for the knowledge of the other. Perhaps they would be—perhaps not; because we are not of the opinion that a general "all-round" or jack-of-all-trades' training is absolutely required by a professional man who has to follow one vocation. Every man needs to have his mind's eye and energies directed to the particular branch he has made his own, or to that for which his faculties fit him. We do not believe that it is better to divide one's energies into a dozen or more channels, than into one or two. One thing is pretty certain: it is, that the power of seeing rightly is the secret of all educational power. The "art of seeing," Adam Smith says, "governs the whole conduct of human life"; Ruskin says the same of art, by which is meant that the man who is most successful is he who can see the clearest, has a sense of the right proportion of things, and can discriminate differences and weigh qualities.

To mention the many branches to which the ordinary architect would plead ignorance connected with the practice of his calling is not our object. By neglected studies we now point to a few of those matters which have more to do with the general conduct of professional duties. The measurement and valuation of artificers' work is one item of the architect's training which seems to be overlooked. Except those who have been trained in a practice where "quantities" are taken out, there are not many who are able to make estimates of cost with any approximate accuracy. A man as an architect may be none the worse for not knowing how to set to work systematically to take the dimensions of work from his drawings, cube and square his dimensions, and make a fairly good bill; but he has certainly lost a useful aid to a practical acquaintance with his work. If he never got out an estimate himself, the knowledge of measuring labour and material would teach him how to economise, and how to check a builder's account, to say nothing of the value of such a training as the means of increasing his practice. To have to submit to the dictates of a quantity surveyor, owing to one's inability to analyse a bill, or to the over-reaching demand of a contractor for some "extra," is not satisfactory. A knowledge of the qualities of materials, such as stone or timber, is a study equally neglected and equally coveted. What would not an architect give if he could be sure that the particular kind of stone he specified was being used, or that it was being placed on its "natural bed"; or that his floors were being laid with Onega or Christiania battens of "good quality." Though as a designer he may be none the worse for not knowing good from bad materials, as an architect he is certainly incompetent to be intrusted with a building. Yet how is he to be taught the difference practically unless he has had the opportunity of visiting quarries or of instruction in the workshop? Theoretical or school knowledge will not give it to him. A course of technical instruction will alone enable him to become a judge, but his opportunities have gone by.

The strength of materials or the mathematical education necessary to make calculations for such things as a girder, a column, or an iron truss, is a branch of the architect's education often neglected, and untaught in the general routine of an office. To become fairly well informed on this important branch of construction requires early self-study, or a course of lectures and demonstration in some school. Not many are able to apply the principle of "moments" to a girder practically; fewer are able to equate the total intensity of stress to the strength of material in a pillar or strut, so as to show what its size should be. The formula or principle may be understood; but the application has never been mastered, and the designer has to consult either a table of results, or leave the matter to the manufacturer. The mathematics of construction is, we admit, not a very attractive subject to the artistic mind, whose instinctive perception of what looks strong enough and agreeable to the eye is often preferred to a laborious calculation. But occasionally, notwithstanding a fine sense of what is right, the practitioner goes astray if he has no means wherewith to verify and check his opinion. Many an engineer's fee might have been saved if practical mathematics had been learned, or if the method of drawing a bending moment diagram for a maximum loading was known. But the subject is neglected during pupilage. It is not a fascinating study to many minds, and it requires close and unremitting labour to become proficient practically. Handbooks and published lists have no doubt lessened the irksomeness of calculation, and we have now sections of joists published side by side with their safe loads, as those of Messrs. Measures Bros.; but still these helps do not supply the architect with the means of ascertaining the strength of any new or special structure. Sanitary science till lately was not a subject which found much favour in the profession. It was relegated to the "plumber," whose mystic craft consisted mainly in concealing pipes and making drains as impervious as possible; but of late years more interest has been taken in the question of sanitation. Nevertheless, it is a neglected study by many architects who, by handing over the work to a specialist, does not trouble about details. Probably the most neglected portion of the subject is that relating to "fittings"—which to specify, and how they should be used in a system of drainage? To know the chief points of a good disconnecting trap, a closet apparatus in their many varieties, a flushing cistern, or a gully trap, requires a special study. Only an experience gained by attention can give one the knowledge of the best mode of ventilation under particular circumstances. Engineering questions, such as modes of heating and the necessary calculations to be made to find the required supply of fresh air and the abstraction of heat by windows and walls; the principles to be observed in the choice of stoves and in electric lighting will occur to every practitioner.

There are two or three other studies which appear to receive much less attention than they did formerly, and to which we may usefully refer: we mean perspective and the art of sciography. It is true we have competent artistic draughtsmen who are adepts at representing architectural buildings in every conceivable, or almost inconceivable, position; but a very small per-centage of these have mastered the science of perspective projection. These experts draw by the eye, as many amateur musicians play by the ear: but few of them would be able to show the scientific projection of a cupola or the points on the curve of a capital seen in parallel perspective. Drawings we sometimes see ignore or travesty the laws of projection. Architects of the last generation were more careful students of the science. In France and Germany, perspective and solid geometry are systematically studied as a part of the architect's course; but we find young English draughtsmen depending entirely upon their eye, even when that organ is inclined to make some very curious slips. The clear conception of the projection of lines differently placed in relation to the picture plane, is the A B C of the art of perspective. The methods for finding the points belong to practical geometry, a thorough knowledge of which is essential; but how few are able to project a complex solid on geometrical principles. The perspective of a square building with its two sides receding from the picture-plane—in other words, the angular perspective of a building—is often glaringly wrong: it is drawn as if we could see as much of the rapidly receding side as we do of the side more nearly parallel with the plane. Or, to state it otherwise, the draughtsman has tried to show as much of both elevations as possible, with the result that a distorted view of the building is obtained. This sort of representation is indefensible. How often circles high above the horizontal line, such as those of the tambour of a dome, are drawn with a much too rapid curvature. The other day we saw a perspective of a dome in which the curves were preposterously sudden, and only suited for a dome of twice the height. All these errors, intentional or otherwise, are misleading; very often they are the result of an imperfect study of planes, their inclination to the picture plane, and their relative positions above the eye. Again, how much the artistic draughtsman loses by not knowing how to put in his shadows. Here, also the value of a knowledge of projection by parallel lines is evident. There are few drawings in which shadows are introduced with any accuracy—we, of course,

except French and other Continental practice. Surely elevations lose much of their realistic effect by not showing the projection of shadows of features like columns, cornices, and towers on the receding faces; and when these shadows represent the actual projections (as when the rays are drawn at an angle of 45°), they contribute to the value of the drawing. A very little study suffices to enable any architect to throw his shadows with approximate truth, and we know many excellent draughtsmen who would be glad if they had such an elementary knowledge of the methods by which a shadow of a tower, a gable, or a chimney could be delineated with tolerable accuracy against the receding and inclined surfaces of a building. Unfortunately, there is no royal road to these accomplishments.

COMMISSION ON ESTIMATED EXPENDITURE.

ANOTHER and somewhat similar case to that of "Cutler v. North" came before the Court of Queen's Bench and the Lord Chief Justice the other day. Again it was a case of disputed commission to an architect on an estimate which the defendant affirmed he limited to a certain amount. The defendant owner employed another architect to do the work at the sum originally contemplated, whereupon the first architect claimed for his own fees and that of the surveyor for quantities on the extended amount of £4,779 estimated by the latter. As in the greater action before Lord Coleridge, the question turned as to whether the sum alleged to be named by the defendant of £2,000 was mentioned as a limit, and upon this point the whole issue at law rested. The reasonableness of the charges made by the architect of 3 per cent. on the estimated amount was not disputed by the defendant; the sole question was, Had a special bargain been made between the parties? In reading the report of the case we have given (p. 61), the defence was that the plaintiff had been instructed to prepare plans for a certain work, the cost of which was not to exceed £2,000; but that after quantities had been prepared and tenders received, it was found it could not be done under £4,779. The architect plaintiff declared that the defendant said nothing about a limit of cost, though the first-named sum had been mentioned in a letter. Additions and alterations were suggested; other plans were prepared to meet the requirements of the County Council, and these were approved by the defendant. Upon these the plaintiff's claim was made, altogether amounting, including quantities, to £360 10s. We have here again the old dilemma: no definite understanding as to the limit of expense, or if there was some vague and undefined mention of a limit of cost, it was subsequently rendered of no account by accepting altered plans, from which quantities were prepared. By accepting altered designs the defendant tacitly admitted his liability to pay on the extended amount. But we find him refusing to bear the cost of the quantities, and only offering to pay 3 per cent. on the limit of the alleged £2,000. It was, of course, easy for the defendant to have asked for an estimate of the altered building; but according to the evidence he did not do so, and though there were many additions, no estimates were given. One cannot wonder at the verdict for plaintiff for full amount claimed. If employers limited in their means do not ask for estimates, and make an agreement with their architect that the cost is not to exceed a certain amount, they have themselves to blame. It is not to be supposed that an architect is to suggest such a limit himself, nor is it fair that he should be expected to bind himself to a certain sum when his employer at the same time is allowed to suggest alterations and additions. Lord Coleridge pointed out the liabilities of an employer to pay the surveyor's charges, and, of course, this has never been disputed, as the claim rests on several previous decisions based on an architect's implied right to appoint a surveyor to take out quantities.

But there was an important point in the judge's remarks which very closely concerns the architect—namely, that an architect could not be permitted to recover by way of commission on the estimated expenditure. Although the profession, he said, thought such a charge reasonable, it could not be enforced. In short, the argument amounts to this: that an architect cannot legally charge by commission on his estimate, but can only recover what is considered to be a *reasonable* remuneration. The question is, what is "reasonable"? Is it an amount which a judge or a jury allow to be reasonable, or one which expert evidence pronounces to be so? One may think a charge to be reasonable, which another declares to be unreasonable. A jury would probably place a lower estimate on an architect's services than would a professional man; they would not be able to estimate the extra labour entailed in making additions or alterations to a design, the amount of thought expended in a certain building. Therefore there is an element of much uncertainty in this view of the case, though it is one to which architects, under the existing state of the law, have to submit. The legal view clearly repudiates a per-centage commission on expenditure, estimated or real, and is a standing protest against this mode of assessing remuneration. No one will say it is reasonable to charge at the same rate for a building which costs £10,000 as on one which costs only £500, providing that the actual thought and skill required in both are the same. To make such a charge reasonable it would imply that the greater building involved 20 times as much skill as the smaller one; whereas, in practice, we know that the opposite is more frequently the case. The illustration, for instance, is equivalent to repeating one design for a house 20 times, as in a row or a street, and therefore it is reasonable that a reduction should be made in the commission. But an excess of expenditure caused by additions and alterations to a design is somewhat different. Alterations to plans of a building which is estimated to cost £2,000, but which ultimately costs over twice as much, incur increased labour and skill, and, therefore, such a case stands on a different footing to that we have mentioned. The building grows in size and complexity, requiring altered arrangements and details, and the architect is certainly entitled to be paid on the increased expenditure; but it is otherwise when the same design is simply enlarged or repeated. Of course this differing circumstance has to be taken into consideration in assessing the architect's remuneration. A "reasonable" remuneration, from a lawyer's point of view, is intended to check the temptation of the architect to increase expenditure. He is often credited, justly or unjustly (let us hope the latter for his own reputation) with running up the cost. Of course there is a distinction to be observed between charging one's commission on real expenditure and only estimated expenditure. A charge of 3 per cent. on the estimated cost for plans and specifications for a building that is not carried out is allowed to be reasonable; it is, in fact, the only basis on which an architect can charge commission for a design not executed. The lowest tender is a fair amount to charge upon. But even this amount may be questioned by a jury, who may doubt whether the tender is a reasonable one. Lord Coleridge said, in giving his decision, that he "objected on principle to a per-centage on an amount not expended, and the question would be what was a reasonable amount? But in some cases it was difficult to make a charge in any other way." No doubt the scruple his lordship entertained about the principle of commission was really that architects ought not to have to make their own charge on estimates prepared by them or for them—that they ought to be perfectly independent of the cost of their designs. We cannot help seeing there is much force in this conclusion. It would be better to charge for the time and labour incurred in the preparation of the design, each man according to his professional position or reputation valuing his own time. Even then the jury's test of "reasonableness" would often conflict with the architect's claims. One man would probably value his time at just double that of another; but in a few years members of the profession would find their level, and their services would be estimated accordingly, just as the painter and sculptor can ask his own price. Meanwhile it will be well for the profession if they regard estimated expenditure as only one of the means of ascertaining their proper remuneration, not as a measure of the real skill and labour expended on a particular kind of building, which may be more, sometimes less. The lessons to be derived from recent decisions on charges founded on expenditure are important also. There is no justification for a client denying his liability after he has allowed his architect to proceed without imposing by writing a limit as to cost, and there is every reason for the profession to be careful in not committing themselves to verbal statements as to cost.

HOUSING OF THE WORKING CLASSES.

ONE of the most important matters which the London County Council have been considering of late is the housing of the working classes, and the Act passed last year gives full power to the Council to enforce its provisions. Various amendments have been incorporated in the new Act. District authorities will be able to secure in a far more able manner than formerly the better provision of dwellings for the poor. As our readers are aware, a conference with district authorities and their officers was held in December last, and the vestries also convened a conference of representatives of different vestries early in the year. Subsequently, as a result of these conferences, a resolution was passed by the London Council to encourage district authorities to "initiate reconstruction schemes for small sanitary areas under Part II. of the Act, and pledging itself to contribute to such schemes, when dealing satisfactorily with such areas, and when the Council is satisfied of the need of assistance." We hear that, as a result, several vestries have applied to the Council, and that applications for loans have been made.

Referring to the Millbank Prison site, the report of the Council mentions that £2,000 per acre was offered for eight acres, forming the back part of the site, but was refused; afterwards the price was increased to £3,000 per acre, with a like result. The price asked was £5,000 an acre. The Government were, under the Housing of the Working Classes Act, 1885, enabled to offer the site, or part of it, to the Council at a "fair market price"; but in the clause of the Act no mention was made of the purposes for which the site was to be used, and it appears from the report "That the full commercial value is above the price that could be profitably paid for the purpose for which the sale was intended." Therefore the committee think that the acquisition of any part of the site for rehousing must be treated as abandoned as far as the Council are concerned.

Several improvement schemes under Part I.

of the Act have been contemplated. We may mention the Bethnal Green Boundary Street Scheme, described by us last year, in which an area of 15 acres, comprising 730 houses, is dealt with, representing about 5,720 persons. The houses are old and dilapidated, and the streets and courts unhealthy. The death-rate for this area is as high as 40 per 1,000. This scheme only awaits the Home Secretary's decision.

At Shoreditch and Southwark other unhealthy areas have been reported upon under Torrens' and Cross's Acts, and are now under consideration; and the committee report other cases at St. Pancras, Greenwich, Shadwell, Limehouse, Deptford, &c., that are under consideration. The activity of the Council may be shown by the number of cases of insanitary areas and houses brought before them. During the year no less than 270 insanitary areas and houses have been dealt with, or are being considered. The unfitness for habitation of 709 houses has been brought before the committee, many of which are the subject of proceedings by district authorities. Under the new Act we hope local authorities will take advantage of the powers conferred upon them, and make representations of all insanitary houses and areas, fearless of consequences. Every facility has been afforded them for so doing. Tabulated forms have been prepared and sent to various vestries and boards; but a great deal of responsibility falls necessarily on the medical officer who has to make an official report. To aid him in this onerous duty, he is recommended to keep a register of all unhealthy dwellings with a view to periodical publication. The tabular information will be of great value if the subordinate authorities act in concert with the London County Council; but there is yet a good deal of friction to be overcome, and we are afraid that the unwillingness of many of these local authorities to act will seriously mar the success of this scheme. There is still a considerable amount of jealousy and opposition at the action taken by the Council.

HOT-WATER ENGINEERING.—VI.

Supply of Hot Water for Baths and Domestic Purposes.

THE CYLINDER SYSTEM.

THIS system derives its name from the fact that a cylindical-shaped reservoir is used instead of the square tank in the tank system, although this is not always the case, as will be seen. Another difference between the two systems is that the reservoir (cylinder) is placed at the lowest possible point, instead of being situated at the top of the house, as described in the last system.

It will be best to first explain why a cylinder has nearly always to be used in this arrangement instead of a tank. The capacity may be the same in either case—that is to say, for a certain sized apparatus the reservoir would be of the same capacity whether the works be upon the cylinder or tank system, so no difference exists in this respect. The difference in shape is entirely due to the much greater strain that is brought to bear upon the reservoir in the cylinder system than in the tank system, as in the former there may be 60ft. vertical height from the cylinder to the cold-water cistern that feeds it, whereas, in the latter, 10ft. (vertical) is a more common measurement, very frequently less.

The cylindrical shape is best able to withstand this strain, as can be judged from a maker's list, which reads as follows:—

Galvanised Wrought-iron *Cylindrical* Hot-water Tanks.

Thickness of plate—				
$\frac{3}{16}$in. ..	$\frac{1}{4}$in. ..	12G. ..	14G. ..	16G.
Tested to, per square inch—				
40lb. ..	25lb. ..	— ..	15lb. ..	5lb.

Galvanised Wrought-iron *Rectangular* Hot-water Tanks.

Thickness of plate—				
$\frac{3}{16}$in. ..	$\frac{1}{4}$in. ..	12G. ..	14G. ..	16G.
Tested to, per square inch—				
10lb. ..	5lb. ..	4lb. ..	3lb. ..	1lb.

It will now be seen that the only reason for using the cylindrical shape is because square tanks are, as a rule, unable to bear the pressure that is exerted below the cold-water cistern; but if the distance, by some arrangement, were but small, then the cylinder system could be carried out with tank for the reservoir just as well as using a cylinder.

Although the question of strains or pressures exerted by water comes under the heading of hydrostatics, it is perhaps desirable to deal with it here, so far as it relates to these works. Without a correct knowledge of this subject it is impossible for the engineer to judge what strength of reservoir he needs under certain conditions, and should too light a one be used, it will assuredly leak.

The pressure exerted by water in pipes is 1lb. per square inch for every 2ft. 4in. that the pipe extends in height. Horizontal pipes do not count, but pipes that slope cause a pressure equal to the height between the highest and lowest point of the pipe. If a sloping pipe extended 50ft., and terminated 3ft. higher than where it started, then the pressure exerted by the water within it would be equal to a vertical pipe 3ft. high—no more. From this it will be seen that to arrive at the pressure or strain exerted in a cylinder or tank, we have simply to measure the vertical distance from the water level in the cold cistern, down to the reservoir, and by allowing 1lb. to every 2ft. 4in. of this distance we get the total pressure exerted per square inch. This is irrespective of how the system of pipes may extend about; but, of course, if a tank were fed by an intermediate cistern, as described in the last paper, the pressure would be calculated from that, and not from the house cistern.

This pressure that has been referred to is merely the weight of the water, and is arrived at by taking the contents of a pipe, 2ft. 4in. long and of a diameter equal to one square inch, which will hold exactly one pound of water. If a boiler had a pipe of this length and diameter screwed into the top of it, and then filled, its contents would naturally exert a pressure of one pound upon the interior of the boiler, but not a pound distributed or spread over the area, but one pound upon every square inch of the interior, bottom, top, and sides alike (see any elementary work upon hydrostatics). This peculiar law will make it clear why reservoirs, situated some distance below the cold-water cistern, need to be so strong, as the total pressure they have to withstand without leakage is enormous. A medium sized cylinder, fixed, say, 40ft. below the cold-water cistern, would have to bear a pressure of 17lb. per square inch, representing in the aggregate, about 10 tons. The rough and ready method of calculating pressure is to allow 1lb. for every 2ft.—i.e., 40ft. vertical = 20lb. pressure per square inch.

There is one other peculiarity to explain in reference to this pressure, which is, that the pressure is exerted precisely the same whatever sized pipe is used; that is, if the cold-supply pipe between the house cistern and the hot-water reservoir be $\frac{1}{2}$in. or 1$\frac{1}{2}$in., the aggregate strain in the reservoir will be exactly the same. This is not readily understood by everyone, chiefly owing, perhaps, to a little difficulty that exists in explaining the reason clearly, in a limited number of words. It was just explained that the water that could be contained in a pipe 2ft. 4in. long and of an internal diameter of 1sq.in. would weigh 1lb.; or, in other words, this pipe would hold 1lb. of water if filled quite full. Now, if we could have an upright column of water 2ft. 4in. high, and 1in. square, it would press with a weight of 1lb. upon the space on which it rested, and which space would be 1in. square. If we took another column and placed it beside the other, we should get a pressure of 2lb. without increasing the height; but note, this 2lb. weight would be exerted on 2sq.in. On the other hand, if the column was the same height, but only $\frac{1}{2}$sq.in. in substance, then the weight of pressure would only be $\frac{1}{2}$lb.; but here again note: the pressure would only be exerted upon $\frac{1}{2}$sq.in. area. From this it will be seen that a cold supply pipe of $\frac{1}{2}$in. diameter brings about a pressure in a cylinder of $\frac{1}{2}$lb. for every 2ft. 4in. of its height, but this $\frac{1}{2}$lb. is exerted on every $\frac{1}{2}$in. of the interior, whereas a pipe of 1in. diameter brings about a pressure of 1lb. for every 2ft. 4in. of its height, but this 1lb. is exerted on every 1in. of the interior, so that the aggregate result is precisely the same.

Fig. 19 shows the cylinder system of apparatus in its most simple form, such as might be erected in moderate-sized property in which the pipes

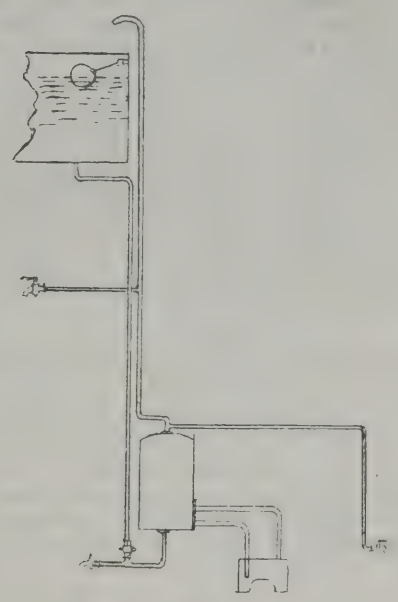

FIG 19.

do not extend far above or away from the kitchen. Where the taps have necessarily to be a fair distance away, then the service pipe which is connected in the top of the cylinder must be "returned," as will be described shortly.

The first and chief peculiarity of this system to be noticed is the position of the cylinder. This is always placed as near to the boiler as can be conveniently arranged; and in any case it has to be fixed at a low point, as all draw-off services are taken from the pipe which extends away from the top of it. As a rule, the bottom of the cylinder comes between 12 and 36in. above the top of the boiler—it is rarely placed higher, as at least 12in. should be left between the top of the cylinder and the ceiling, for the convenient connection of pipes, &c. There is no gain whatever effected in placing the cylinder more than 24in. above the boiler, unless it is to avoid some obstacle or structural impediment. There is nearly always a convenient recess on one side of a kitchen fireplace. If not there, possibly the scullery is situated at the back, and the cylinder can be placed there. Occasionally instances occur in which a place for the cylinder cannot be made anyhow, the only space being a square opening over a cupboard. In this case it becomes necessary to use a square tank; but if a fair pressure of water has to be withstood, the tank will have to be made of very thick plate. The tank maker should be informed of the circumstance, that he may have it tested accordingly. It is a most unfortunate job to have to take out a leaky tank or cylinder after the apparatus is all completed; it is always a reflection upon the quality of the work.

Sometimes the available space will only admit a cylinder lying lengthwise. There is no serious

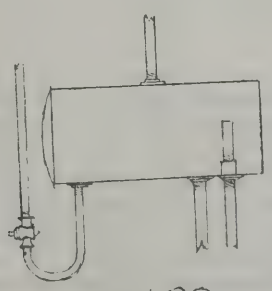

FIG. 20.

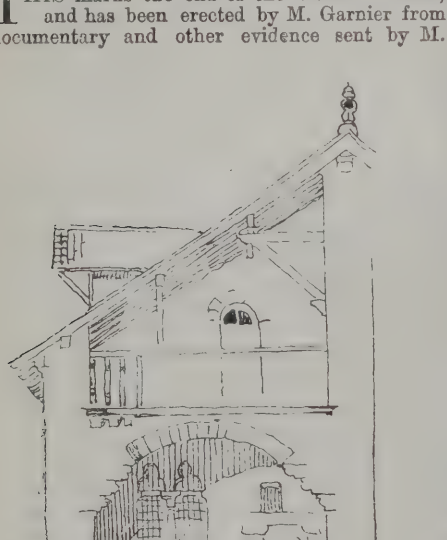
objection to this—its odd appearance is the chief drawback; but it is better in results than using a square tank, unless the pressure be light. In this case the connections would be made as Fig. 20.

In this last illustration it will be noticed that all pipes are connected into the cylinder with

flanges. This is a very necessary feature, and cylinders should always be ordered with the holes cut, and flanges affixed in the positions required. Makers' list prices always include providing two flanges (sometimes more); any more than these are charged for extra. A far superior joint is made with a flange than with backnuts, of better appearance, and decidedly quicker.

Cylinders are made with manlids or with loose tops, or without either. The writer considers that the manlid is preferable to the loose top for getting at inside connections; but if the flanges are ordered to be affixed in the right places, then there is no occasion for either, and a saving of several shillings is effected. A cylinder without a manlid or loose top cannot be opened; but this is no objection: the flanges permit of all the joints being made from the outside, and these reservoirs never want cleaning out.



THE "HISTORY OF THE HABITATIONS OF MAN."

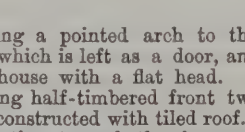
By BANISTER FLETCHER, JUN.

(*Continued from page* 836, *Vol. LX.*)

SCANDINAVIAN HOUSE.

THIS marks the end of the Invasion Period, and has been erected by M. Garnier from documentary and other evidence sent by M.

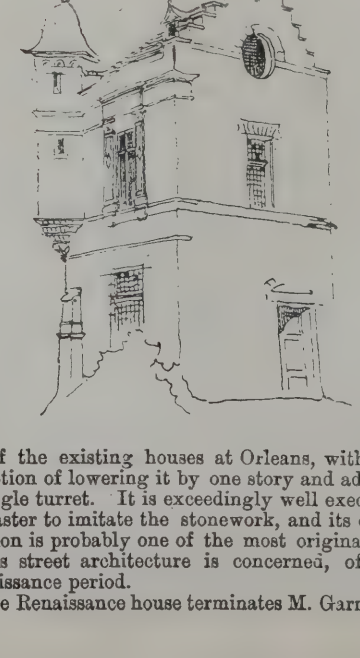
Romanesque House B 89
Nº 160



Boberg, a Swedish architect, who has made a special study of the ancient habitations of the Scandinavians. It is constructed entirely of wood, from the same forests of Norway and Sweden, which still give out such enormous quantities of wood, and which were then used by the Northmen for building their sturdy ships. This, then, ends the Invasion period.

When the invasions ceased, and civilisation asserted itself by slow degrees, types of dwellings common to the whole of Western Europe were produced, and M. Garnier commences with a Romanesque House of the 10th century (No. 160), the plan and a sketch of which I give above.

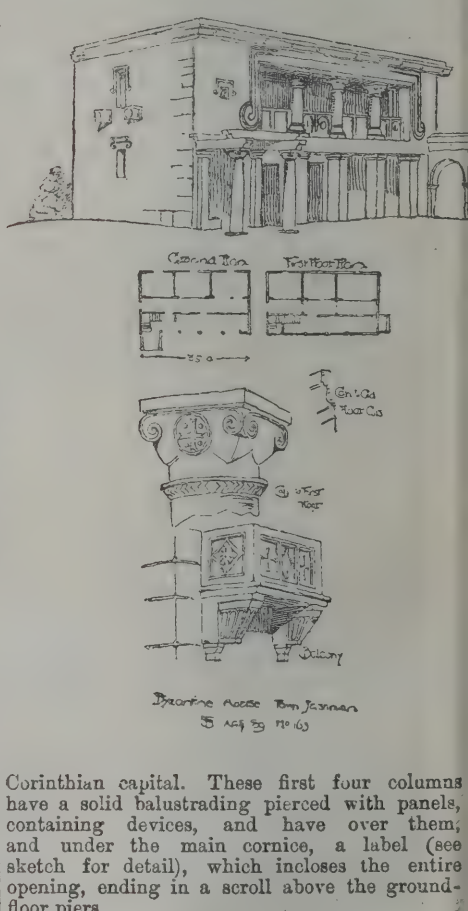
The entrance, it will be seen, is under a segmental archway, the arch itself resting against the upper of three corbelled courses. Over the entrance is a recessed balcony with wooden balusters. It is covered with a sloping roof covered with tiles, and a dormer window. The windows where they occur are coupled with Romanesque-like capitals between, the windows themselves being straight-headed, with a trefoiled arch formed in the solid over (as in the New Law Courts by Street). The ground floor contains large chimney corner as it were (see plan).



House of the Middle Ages in the time of King Louis —XIII. century (No. 161).—This is a very characteristic front, the lower portion in masonry

containing a pointed arch to the shop front, part of which is left as a door, and the entrance to the house with a flat head. Above this is a projecting half-timbered front two stories deep, solidly constructed with tiled roof.

Projecting towards the river and inclosing the public square is the *Renaissance House* (No. 162) of the time of Francis I. M. Garnier has copied



one of the existing houses at Orleans, with the exception of lowering it by one story and adding an angle turret. It is exceedingly well executed in plaster to imitate the stonework, and its composition is probably one of the most original, as far as street architecture is concerned, of the Renaissance period.

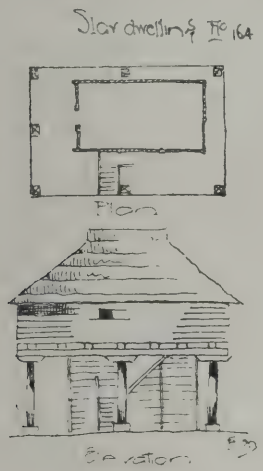
The Renaissance house terminates M. Garnier's history consequent on the Aryan Invasion as far as the West is concerned, and the houses which follow are those of the people under the influence of Byzantium.

The Roman civilisation in the East lasted from the 4th to the 15th centuries, and had a character quite its own, and distinct from the West, and this period therefore commences with a Byzantine house of this period, and then specimens of the influences of the Byzantines upon the Slavs and the Russians, and the period of Mussulman or Mohammedan invasions.

The Byzantine House (No. 163.)—The old empire of the West having been shown to be under the influence of the barbarian invasions, the Eastern Empire lasted, with Byzantium as its capital, from the 5th to the 15th century. The house given is of the reign of Justinian (6th century), and is said to be an exact copy as to its plan, elevation, dimensions, and details, of a Byzantine house in Central Syria measured and drawn by M. le Marquis de Vogué. It is entirely in stone and solidly constructed, wood not being found in this part of Syria. It contains two floors, and the front is formed in open arcades, the columns in the ground floor being square, with slight moulding at top (see sketch), and the columns to first floor being short, circular columns, with heavy necking mould, and two different specimens of capitals, the outer ones being rude Ionic, with a circle between the volutes and the central one, a Byzantine modification of the Roman

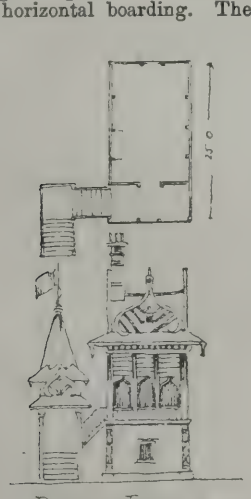
Corinthian capital. These first four columns have a solid balustrading pierced with panels, containing devices, and have over them, and under the main cornice, a label (see sketch for detail), which incloses the entire opening, ending in a scroll above the ground-floor piers.

The projecting balcony at the side is approached from the first-floor loggia.



I give a sketch plan, from which the general arrangement may be seen. It will be seen that the staircase is under cover, and leads to the first floor from a sort of porch. The length of the building is divided into three rooms, and these are approached from an internal passage.

The Slavonian Dwelling and the Russian House (No. 164).—These two houses show the Byzantine influence which spread itself over the population of Eastern Europe. These two houses belong to M. Garnier's last group of Aryan habitations, and in many respects resemble one another: the Slavonians here represented by a Servian habitation, a plan of which I give. It is composed entirely in wood, rough squared, resting on a rough stone base. It is surrounded with rough wooden columns, which support the projecting first floor. There is an exterior wooden staircase leading to the first floor. The windows are ex-



ceedingly small. The woodwork is painted in crude tones of red, yellow, and green.

The Russian House (No. 165) of the 15th century, is also in wood, but the ground floor is composed of rough stone covered with plaster.

This, like the Slav dwelling, has also an exterior staircase, and it is covered with an ogee-shaped roof and wooden flêche above. The staircase leads to the first floor, the space between the upright framing being filled in partly with stained glass, and having an ogee arch at the top. The space above has horizontal boarding. The building is

covered with a horseshoe-shaped roof, following the outline of the gable. It is taken from the neighbourhood of Moscow. There are many points in common between this and the Slav dwelling: both in wood, being built in countries where wood abounded and stone was scarce, and both have an interior staircase, resulting in each case from Eastern manners and customs, which separate the dwelling of the men from the women, the first floor being called the "terem," a Russian word signifying the women's part of the house, and which, in consequence of being on the first floor, came in time to mean the first floor itself.

While the Byzantine Empire increased on the North in Eastern Europe, it was, however, broken up on the South by the invasion of the Arabs in the 7th century, in order to propagate the new religion of Mohammed, and the next two habitations—the Arab house and the Soudan habitation—are of this period.

The Arab House (No. 166) is not the reproduction of a special house, but of a combination of authentic elements produced partly by the climate itself, and partly by religious and social prescriptions. For example, the Mohammedans not being allowed by their religion to represent pictorially living things, "arabesques" were the result, which, in their origin, were nothing more than Arabian letters. The horse-shoe arch is also given in the entrance door.

The wooden trellis projecting windows to the first floor are also the natural result of a religious and social custom which did not permit of the women being seen unveiled, this particular form of window, however, enabling them to see without being seen. The principal entrance leads into an open court, from which the rooms are entered, and in which is the staircase leading to the first floor.

RAISING, MOVING, TRESTLING, SHORING, WIND-BRACING, AND UNDERPINNING BUILDINGS.—XI.

(CONCLUDED.)

By ALEX. BLACK, C.E., Architect.

TRAVERSE MOVING AWAY OF BUILDING TO CLEAR BEAM-BEARINGS IN PARTY-WALL.

IN preparing to move and lift houses built on corner sites, or on sites where the building to be moved or lifted up bodily is confined only on one side by a party-wall, it may be under certain conditions preferable to the methods previously mentioned (p. 736), when beams and joists have bearing in the party-wall, and also when the old party-wall is to be utilised in the lifted structure, to use "traverse" screw-jacks to draw the building away endways from the party-wall, so that the bearing ends of joists and beams therein can be readily cleared therefrom. When the building is raised up to its destined height it can then be traversed back again, and in such a procedure the beams can easily be made to have bearing in the party-wall at their higher position.

With a view of affording certain useful data in connection with the use of traverse screw-jacks for this purpose, the particulars of them are appended in table II.; but it may be here observed that those jacks which are furnished with ratchet-levers for lifting and for traversing would hardly permit of conveniently exercising sufficient man-power for working them under the great weight which a masonry house would most likely impose.

When using traverse jacks, the pier blocking up to the level of the pavement, when required to bring up solid bearing from the ground through basements, cellars, areas, &c., should be made wide enough to support the whole length of the necessary traverse movement of the building away from the party-wall. If a low wall or structure prevents this extension of the pier to a sufficient distance, a separate block pier must be built on the other side of the wall, &c., and a substantial connection of beams be made between them in order to bridge over the obstruction. If there be no area, strong transverse and longitudinal sleepers crossing each other should be laid on the ground so as to impart to the sleepers, piers, &c., sufficient firmness to take the greatest weight of the building coming upon it, so that all unequal settlement may be avoided. Any inequalities in height in levelling from pier to pier, &c., across the obstructing walls, &c., must be made good by solid packing, wedging, dead-shoring, &c., according to circumstances.

Note.—The extra weight of "traverse" jacks over the "lift" jacks as scheduled in tables I. and II. makes them more unwieldy to "fleet" at each run out of the lifting screw, so that "house-raisers" would prefer to use simple lifting bottlejacks, or like Fig. 30, for the raising portion of these operations. Consequently, when the building is lifted up to its proposed height by means of the simple lift bottle jacks, or like Fig. 30, the "traverse" jacks must be re-inserted at the same level where they were originally used in drawing away the building, in order to retraverse the building back again to the line of its original position of proximity to the party-wall, and thus to afford bearing for beams and joists at their higher destined levels.

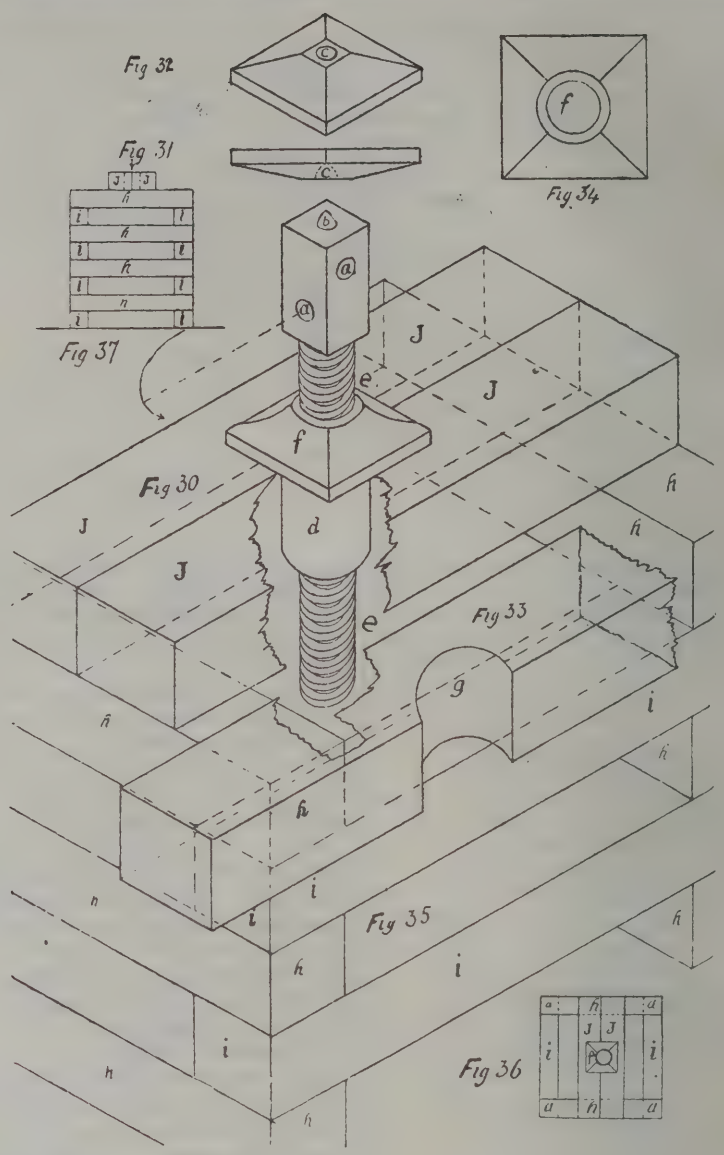
LIFTING SCREW-JACKS, AMERICAN TYPE.

At p. 325, Fig. 17, shows a mode of adaptin to the use of raising and moving small houses, *en masse*, the common "bottle" screw-jack, which is usually made in this country for general purposes. But when it becomes necessary to build up gradually piers of blocks of wood underneath heavy buildings of masonry which are thereby being lifted up to a considerable height, as presently described, the typical American pattern of lifting jack is much preferable. A good specimen of this description of jack is shown, set in a pair of screw-blocks, all drawn in orthographic projection, by Fig. 30. It consists of the right-handed screw proper *e*, with square thread. It has also a square head at the top end of it, terminating with an egg-end pivot, *b*. In the head are two holes, *a*, passing through it, one above the other in alternate faces, to receive a loose iron lever 2in. in diameter × 6ft. long, by means of which the screw is worked up, as indicated by the arrow-head. A broad-shouldered box, *f d*, contains the nut, or female screw. The shoulder, or square flanges, *f*, of the box, shown in plan in Fig. 34, rests upon a pair of oak screw-blocks, 6in. × 8in. × 3½ft. long, J J (Fig. 30), hollowed out so as to receive the cylinder, *d*, centrally between them. Fig. 33 shows one of these screw-blocks hollowed out at *g*. It will be noted that a part of the front screw-block of the pair is cut away to show the screw *e* and cylinder *d* of the box when set in the blocks. A loose square cap (Figs. 31 and 32), which is slightly pyramidal (truncated) in elevation, fits upon the head of the screw. It is furnished with a hollow egg-end hole, corresponding to the pivot, on which it is capable of turning freely. Fig. 31 shows the cap in elevation, held up vertically over the head of the screw ready to be placed upon it before being put underneath the ends of the needles, &c., in house-lifting operations. The average size of screw used for heavy masonry house-lifting is 3in. diameter, with a pitch of thread of ¾in. Their safe lifting capacity ranges from 10 tons upwards. The screw runs out of the nut 14in. under heavy weights, and remains quite steady. This is the clear effective lift of the screw each time the jacks are "fleeted." Two men using a 6ft. iron bar lever can raise 10 tons with one of these jacks. The Figs. 30 to 33 are taken from the particular pattern made specially for the use of Messrs. B. C. Miller and Sons, of Brooklyn, N.Y., who have kindly furnished a sketch of it.

THE BUILDING-UP PIER-BLOCKS.

In the operations of lifting up buildings above their original level, temporary pier supports, which are readily increased or reduced in height gradually, are necessary. These piers must have sufficient stability within themselves to preserve the masonry house safely, and also must

admit as freely as possible of the necessary working and constructional operations between them. It is found in practice that piers constructed of pairs of blocks of oak in courses crossing each other alternately, serve this purpose for all ordinary cases when 3½ft. long, and of a square or rectangular section of from 6 to 8in. These blocks must be cut to exact rectangular uniform section and length, and the aggregate area of the four contact corner surfaces in each course must be sufficient to insure safety against crushing of the fibre of the blocks. In order to economy and compactness, the ends of the blocks are built flush with the sides of alternate courses, as shown at *h h*, *i i*, in the front corner of Fig. 35, which shows five courses of built pier blocking underneath the pair of screw-blocks J J.



[*Note.*—It may be necessary to explain with regard to the crowding together of the figures, that the addition to Fig. 30 (underneath the pair of "screw-blocks" in which the screw is set) of the upper five courses of a blocking pier which comprises Fig. 35 was an afterthought; hence it will appear clearer by conceiving Fig. 33 (which shows the semicircular hollow for receiving the cylinder *d* of the screw-box) to be removed.]

The key diagrams, Figs. 36 and 37, will afford a clear conception of the approved arrangement of the blocks. The corresponding letters will aid in readily identifying the same pieces in the projection and in the plan (36) and elevation (37). A comparison of Figs. 17 and 35 will show that the latter is not a mere repetition of the former. An inspection of the key plan Fig. 36 shows that only the four end corners *a* of, say, 6in. square of the alternate courses are in contact vertically. The aggregate area of these surfaces make 1sq.ft., resisting the entire compression upon the blocks. A safe load for such temporary structures for average English oak in good condition may be taken at about 400lb. to 500lb. per square inch, or over 20 tons per square foot. This assumes that the entire area of the aggregate of four corner surfaces are equally and uniformly pressed, and likewise pressing upon each other; but a wind or twist, or warping in the block will cause a liability to rocking of the pier, and hence its instability until the torsional resistance of the twisted block is completely overcome by a sufficient weight being in action upon it. Large hard knots occurring within these end contact surfaces would also be a potent cause of irregularity of action. To prevent unequal loading of either of a pair of pier blocks, the screw-blocks J J should be set in the middle of the length of the pier blocks *h h*, Fig. 36. The arrow above Fig. 37 shows the vertical direction of the axis of pressure of the weight of the house upon the needles. Accumulations of inequalities of section in each pair of blocks, if predominating on one side of a pier of, say, over 20ft. high, such as might be required for sub-building a shop with a mezzanine story over it, might impose, by obliquity of action, a serious inequality of stress upon some of the pier blocks. In the usage and incidental knocking about, and weather exposure of blocks, the edges and ends are very liable to serious abrasion and wearing away; hence, for tall block piers, none but perfect blocks should be used.

SCREW-JACKS—ENGLISH.

Amongst the types of lifting screw-jacks made in England, those which might be adaptable for house-lifting purposes when the lift does not exceed a few feet, are known as the "bottle" and "tripod" and the tripod-bottle or skeleton, or "open case." The traverse jacks are similarly distinguished. The usual form of cap, however, is rather contracted, and would seriously injure timber needles under heavy loads unless an iron plate were interposed. The American bell-bottom lifting screw-jack, with its saucer-like cap, is a preferable form for this purpose. The jack sketched in Fig. 17 is a rough outline of this American type, p. 325, Vol. LX.

The following are useful particulars of the common "bottle" screw jacks for lifting and traverse operations as usually manufactured in England for general purposes. The scheduled items are principally furnished by Messrs. Tangyes (Limited) and Messrs. Rownson, Drew, and Co., the former distinguished by a T, and the latter by an R. The others represent corresponding sizes of various makers. They will serve as an approximate guide for similar particulars relating to corresponding sizes of other manufacturers in different provinces, as well also in some degree for those of the special American type of house-raising screws, illustrated in Figs. 17 and 30. The weights are averages.

Tangyes have recently redesigned their tripod and bottle types, giving them a uniform run-out of screw of 12in., and likewise their traverse jacks, giving a uniform traverse of 12in. in the sizes here enumerated. These changes, they state, make them lighter, and the lifting-jacks stronger.

Table I.—Lifting Screw Bottle Jacks.

Diameter of screw in inches.	Pitch of thread in parts of inch.	Clear lift in inches.	Height when screw down in inches.	Weight complete in pounds.	Safe lifting load in tons.	
2½	See note below	17½	30	81	12	"Tripod-bottle" T

2¾	"	20	33	90	14	
3	¾	22	36	112	16	

Note.—English manufacturers do not publish the pitches of threads of their jack-screws; but for diameters between 2in. and 3in. the threads may range from ½in. to 1in. pitches. Some makers have ½in. pitch for screws between 2in. and 3in. diameter. But for house-lifting purposes the pitch of the screws should be previously known, as all lifting screws used in the same operation should be of exactly the same pitch to avoid overstraining any part of the building (see p. 393).

The hire of single lifting screw-jacks ranges from 2s. to 3s. per day. The hire of 50 to 100 jacks per month, say, about 15s.

In America the screws are hired at 50 cents to 75 cents per day, according to number hired and extent of time required for.

Table II.—Traverse Screw Bottle Jacks.

Diameter of screw in inches.	Pitch of thread in parts of inch.	Clear lift in inches.	Height when screw down in inches.	Weight complete in pounds.	Safe lifting load in tons.	Length of traverse.	—

3	½	17	34	168	20	22	

The hire of traverse screw-jacks per month, of 50 to 100, say about 20s.

HYDRAULIC JACKS.

Hydraulic jacks have not been much used in house-lifting or moving operations. At the Great Yarmouth Town Hall lifting operations a hydraulic jack was only used at a few awkward places (p. 490). They might be employed with advantage under very massive houses where more

than 10 tons would be imposed upon each jack, as up to 50 or 60 tons can be raised by hydraulic jacks by one man. Their most advantageous employment would be in places where hydraulic power is readily accessible, so that a systematic service of hydraulic pressure could be arranged to effect a uniform lift all round the building simultaneously. The prices and weights of hydraulic jacks are about ⅛ to ½ more than those of the bottle screw-jack of same lifting power.

TRESTLEWORK SHORING.

In cases where the building has been lifted up high enough above its original site to introduce more than one low story above the ground level, and where there is extensive excavation to be made, and enlarged or altered foundations to be constructed, and extensive masonry of sub-stories to be built, it may be preferable to erect a strong system of trestlework underneath, and supporting the main walls of the building at wide intervals, instead of substituting simple dead shores for the blocking piers singly, which only admits of the work being done piecemeal, or in small patches at a time. The blocking piers, upon which the building has been lifted up, would thus be all removed together, after the trestling has been erected, so that extensive excavation and substructural work could be executed with desirable progress upon a more extensive scale of operations. The arrangement of the pieces of which a system of trestlework consists is usually symmetrical on both sides of the wall. Its essential parts should consist of longitudinal balk sleepers laid on the ground, or, if necessary, upon transverse heavy planking first laid upon the ground, both along the inside and outside of the main walls of the building, and to be sufficiently apart to be clear of the proposed excavation. Across these sleepers, at convenient intervals, should be laid heavy transverse sills; these could be doubled in superposition for the centre half or two-thirds of their length in order to reinforce their transverse strength. Upon the double portion of the sills are butted vertical legs or dead shores on both sides of the proposed wall alike. Athwart the tops of the vertical legs are laid tie-beams, taking about three-quarter bearing upon their heads. Upon the ends of the main sills are set up raking legs inclining towards the wall on each side of it, which are notched with a bird-mouth at top under the outer edge (about one-fourth of the width) of the stringer next described. Along the notched tops of the raking legs, and across tie-beams laid on top of the vertical legs, are placed longitudinal stringers or heavy beams, which may be doubled in superposition and breaking joint over legs to take the weight of the superstructural walls carried by the needles. The tie-beams and the vertical and raking legs are braced together near their meeting angle by planks spiked to them. Strong iron dogs securely hold together the superimposed stringers, and both to the head of each pair of raking legs, also to the transverse tie-beams and to the needles. The feet of the vertical and raking legs and the sills and sleepers are in like manner secured together. The vertical and raking legs should be tied together transversely at their top, in addition to the bracing above described. Longitudinal bracing should be introduced between the vertical legs to prevent accidental swaying movement. The distance apart of the transverse sills carrying the supporting legs should be sufficient to afford full facility for the performance of the excavation and building operations involved. Their position should, as far as possible, correspond with those of the fenestral openings in the walls. In all cases the trestlework should be arranged so that all its parts can be readily withdrawn without interfering with any portion of the permanent work, upon the completion of the underpinning of the old walls upon the new masonry. By sufficiently reinforcing the transverse strength of the stringers, the longitudinal distance apart of the legs can be safely increased.

In all temporary structures of this class the student should aim to arrange the pieces of timber so that as little cutting into the sides of timbers, mortising, housing, halving, or other modes of frame-jointing and fitting shall be required as possible, as being wasteful of timber and expensive in workmanship.

SETTING THE SCREWS.

The screws should all be of the same pitch and lift exactly, and should be set under the ends of each needle precisely plumb to avoid eccentricity of action, and about 2ft. outside of the walls. The screws are first adjusted, or "set," all round to the same unvarying tightness of pressure under the building by one careful man, so that all the screws shall thus be equally pressed with the same degree of stress of the load, and thus avoid the chance of any screw taking more than its assigned load, whereby injurious strains may be engendered in some parts of the structure.

PLATFORM FOR WORKING THE SCREWS.

As the building gradually rises up and the height for working the screws from the ground gets inconveniently great, a platform of planks is built on timbers spanning the space between the opposite tiers of block piers; or, when this is too wide, on cantilevers inserted in the block piers. This platform or scaffold is built or moved up each time that a fleeting or run out of the screws is made. The men working the screws being all thus together in sight of each other, can act simultaneously under one leader in the screwing-up of the jacks by which they are thus surrounded.

MODES OF PROPULSION.

These vary with the massiveness of the house, and the distance of its transportation. A three-story brick house, 18ft. by 30ft., of four walls, the front and rear walls being 30ft. to the eave, was moved on timber ways and hardwood rollers, by two horses working a 12ft. capstan bar, and the intervention of block and tackle gearing. For heavy houses, forcing jack-screws are butted against balks solidly bedded in earth banks where available, or against transverse timbers chained to the way-timbers, or against butting blocks fastened by chains, or other means, to the way-timbers, to receive the foot of the screw-jacks, while the head of the screw-jacks press against the ends of the cradle-stringers. Pulling screws and hydraulic pulling-jacks can sometimes be fixed to firm objects ahead. Propulsion by screws is a slow process, and often crab-winches, or capstans, worked by man power, with the intervention of block and tackle gearing, can be substituted. But all such arrangements must depend on the amount of propelling power required, distance, &c.

THOMSON'S ROAD STEAMER AS A PROPELLER.

A substantial "frame" house, 25ft. by 45ft., weighing 30 tons, at Stockton, California, was safely, expeditiously, and economically moved about 100 yards in three-quarters of an hour, BUILDING NEWS, September 8th, 1871, p. 188.

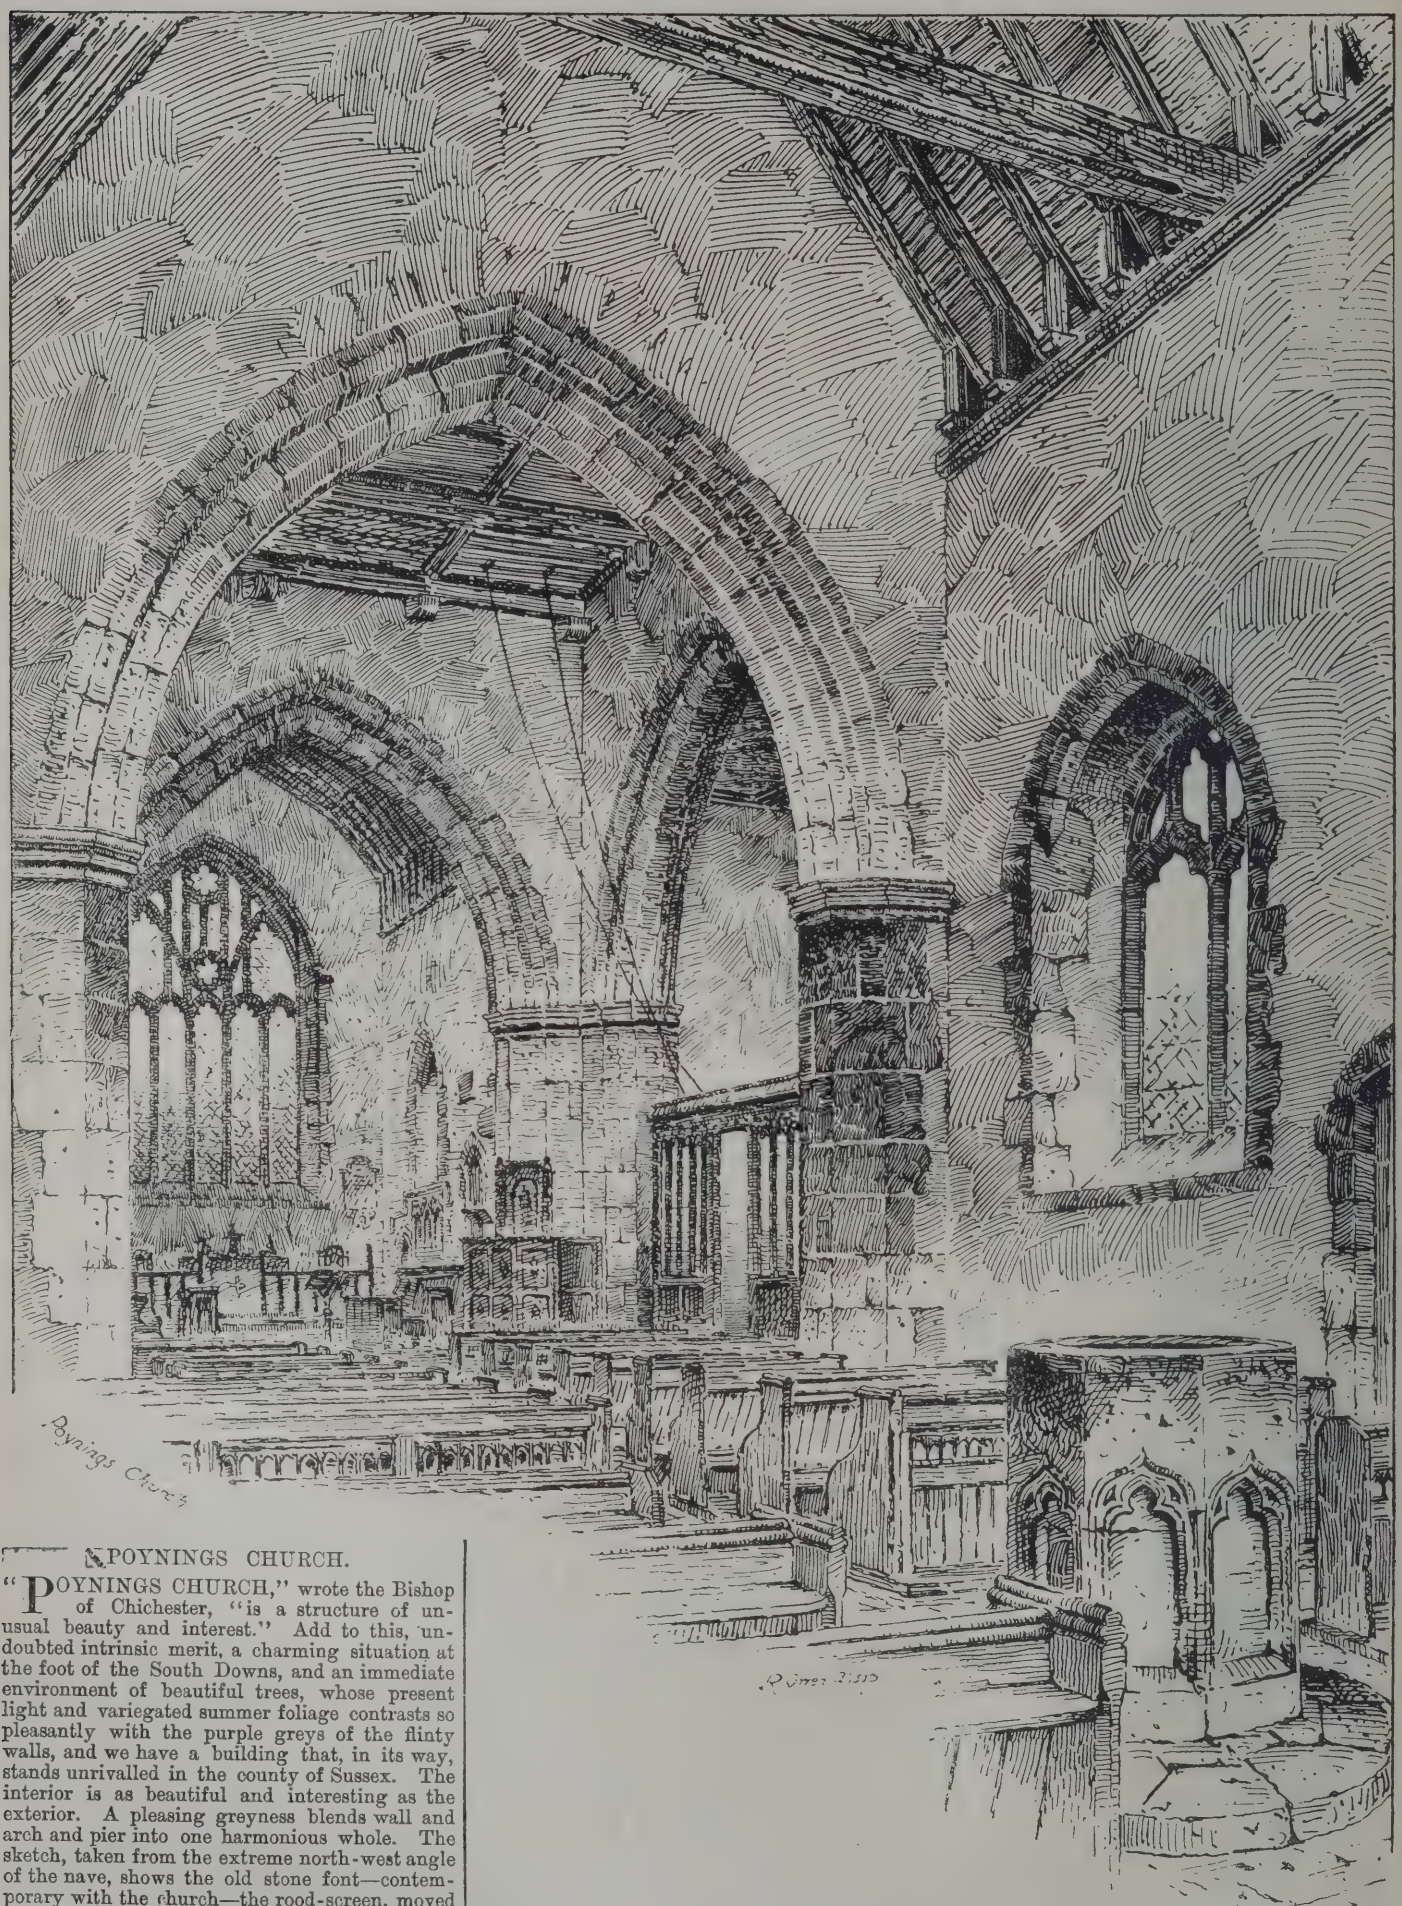
FURTHER LITERATURE ON HOUSE MOVING IN AMERICA.

Penny Magazine, Vol. 6, p. 67, "Frame" Grist Mill, 1837; ditto, Vol. 11, p. 284, Brick house, 1842; letter of Dr. E. Wells, Reading, in *Berkshire Chronicle*, January 23rd, 1869; *Journal* of Franklin Institute, Philadelphia, Vol. 89, p. 89, 1870, Hotel Pelham; ditto, Vol. 100, p. 178, 1875, Brick house; *New Era*, N.Y., Vol. 3, p. 153, 1873.

MOVING A MASONRY HOUSE AT READING WITHOUT DISTURBING THE OCCUPANTS, ETC.

In addition to the instances of removal mentioned, March 20th, p. 393, and April 3rd, p. 490, the following has been traced: — In 1869, January 29th, on the occasion of erecting a new iron lattice bridge at Caversham, across the Thames river, jointly by the Corporation of Reading and the County of Oxford, to replace a very narrow stone structure of considerable historic interest, a brick house with slated roof which was considerably out of repair, and stood upon an islet in the middle of the Thames on the east side of the old bridge, and upon the site of the new and wider structure, was moved to one side about 25ft. The house, which is known as the "Waterman's Cottage," by 35ft. by 25ft. on plan, and three stories high, or 30ft. from ground line to roof plates. The N. and E. walls are 9in. thick, and the S. and W. are 4½ brick panel in timber frame, and composted outside. The house and contents weighed about 180 tons. The contractors for the bridge were doubtful about the safety of its *en masse* removal but Mr. J. Dormer, the clerk of works, and now of the Great Western Railway, undertook the removal for the contractors, and accomplished it safely without accident of any kind in three hours after the preparations were completed. The furniture and four persons of Mr. J. Piper's family, who were living in the house at the time, remained in the third story during removal from start to finish. The cost of preparatory work, use of materials, jacks, &c., and of removal, and of new timber-piled foundations, was £50. The saving effected, as compared with taking down and rebuilding the structure, was £150, besides over a year's time, rent, and incidental expenses. The lower portions of the timber framing were rotten, and were previously replaced by new sills, which rested on parallel lines of three pairs of roller plates, one pair being placed in the middle, and one at each side. Short wrought-iron rollers worked between the plates, the sides of which, in contact with the rollers, being protected by strips of iron. The inner walls and partitions were strutted and stayed to prevent distortion. The removal was effected by means of hydraulic and screw-jacks (partly from *Berkshire Chronicle* of January 30, 1869, and partly furnished by Mr. J. Dormer, of Tilehurst, Reading).

THE MOST RECENT CASE OF HOUSE-LIFTING AND REMOVAL IN ENGLAND.



An interesting, and one of the most ancient houses in the United Kingdom, known as "Trinity House," Worcester, which was originally a part of the notable ancient mansion "Trinity Hall," was removed *en masse* a distance of 30ft. S. and 6ft. W. by Messrs. Bromage and Evans, Worcester. The removal was completed on May 8th. The house is 30ft. by 30ft., and two stories high, constructed partly of "brick" nogging. The greater portion of the "brick" being hand-made tiles. Powerful screw-jacks were brought into operation to lift the building (which is computed to weigh over 250 tons) bodily, so as to allow of large balks being put under the whole length, and about a dozen cross timbers inserted between them and the building. Railway metals were placed in position for the structure to slide on. By means of a winch, the chain of which was fastened to the centre of a heavy rail placed crosswise, the building was safely moved on to its new concrete foundations. As indicating its antiquity, the partitions and parts of the north and south walls were made in the hurdle style (wickerwork of wattles, or interwoven twigs, and stakes), and then covered with plaster. The peculiarity of the old building is in having a covered balcony or gallery outside extending along the front elevation, by which the second story was approached, and a peculiar-covered passage under it, leading to a street at the back. It is said that Queen Elizabeth, when visiting Worcester, addressed the citizens from the balcony, and a portrait painted on wood of the good queen adorned the building. The public spirit of Worcester gentlemen has thus saved from demolition a very interesting building, which stood in the way of street widening. It is a worthy example, which might be followed with advantage in many places. The removal cost £40.—(*Lincolnshire Chronicle*, May 15, 1891.)

THE MOST REMOTE HOUSE MOVING IN ENGLAND.

In contrast with the above may be mentioned that a house of John Stow's father in Throgmorton-street was loosened from the ground and removed on rollers to a distance of 22ft. by th order of Thomas Cromwell, afterwards Earl of Essex, as the house stood in the way of enlarging his garden. — Stow's "Survey of London," 1598.*

Under the superintendence of Messrs. C. F. L Horsfall and Son, architects, Halifax, a handsom reredos has been erected in Warley Church, near Halifax, by Messrs. Jones and Willis, of Birmingham and London. The central panel is a spirited carving representing "The Lord's Supper," the grouping being that of the famous fresco by Leonardo da Vinci. The figures are carved in very high relief in oak, of which wood the framework is also built. This consists of an elaborate canopy of seven arches with crocketed gables above in the Early English style. A battlemented mould runs between the gables, the spandrels being filled with carving. The canopies are supported by columns at the end, flanked by buttresses terminating in crocketed pinnacles. The side wings form a framework for the Decalogue, Creed, and Lord's Prayer, which are painted upon the wood, the panels being filled with tracery of a simple character.

* The previous Nos. of this serial have appeared at pp. 89, 190, 256, 325, 392, 490, 588, 632, 735, and 832, Vol. LX.

POYNINGS CHURCH.

"POYNINGS CHURCH," wrote the Bishop of Chichester, "is a structure of unusual beauty and interest." Add to this, undoubted intrinsic merit, a charming situation at the foot of the South Downs, and an immediate environment of beautiful trees, whose present light and variegated summer foliage contrasts so pleasantly with the purple greys of the flinty walls, and we have a building that, in its way, stands unrivalled in the county of Sussex. The interior is as beautiful and interesting as the exterior. A pleasing greyness blends wall and arch and pier into one harmonious whole. The sketch, taken from the extreme north-west angle of the nave, shows the old stone font—contemporary with the church—the rood-screen, moved to the south transept arch, and the fine, dark oak Jacobean pulpit. The plan of the church is modelled on the Greek rather than on the usual Latin Cross. There are no aisles, but the transepts are of the same width as the nave and chancel. Each of the four sides of the crossing has similar bold arches of two orders, plainly chamfered, and carrying a square belfry. The church is in the Perpendicular style, evidently Early, and remarkable for the boldness and "breadth" of its design, the mouldings being large and fulsome. The fine proportion of the arches and the absence of those of a depressed, or four-centred outline, the simplicity and breadth of the composition, and the bold and liberal treatment of the details and mouldings, give a nobility of character to this old building that we do not find in all Perpendicular churches. The rector of Poynings has kindly supplied some notes of interest in connection with the history of his church, taken, for the most part, from a work of his predecessor

NEW PAVILION, SOUTHEND PIER. COVERED BY MESSRS. HOLDEN & CO.

(View looking from the Pier Head.)

the Rev. T. A. Holland. In ancient deeds, Poynings is spelt, and the name still at times pronounced, *Punnings*. In a charter of King Eadgar, A.D., 960, Poynings is written *Puningas*. Mention is made in the reign of King Stephen of one Adam de Ponynges, probably the first of the family who possessed the manor during nearly three centuries. The sixth or seventh in descent from the first Adam de Ponynges, Michael, the third Baron, bequeathed by his will, in 1368, 200 marcs *for building a new church* at Poynings—"poure faire une nouvelle eglise a Ponyngges." The will mentions "Johan de Worle, person de l'Aglise de Teryngg," as executor. Thomas, fourth Baron of Poynings, superintended the rebuilding of the church, together with the above-mentioned John de Worle, of Tarring, who was admitted incumbent in 1368. The work of building the church probably began in 1370, and cost 400 marcs = £4,800. It was erected on the site of a former church, dedicated to the Holy Trinity. Alfriston Church and Tarring Church, in Sussex, both bear a likeness to that at Poynings. Alfriston Church, probably older than Tarring chancel, is considered to have been the general prototype of Poynings. Although the chancel and nave are, together, longer in proportion to the transepts than they are at Poynings, the two buildings have so much in common that it has been suggested that they were designed by the same hand. Poynings Church has been well and carefully restored from time to time, on the last occasion in 1890, by the present rector, Mr. Christian acting as architect. Here and there the church requires further reparation; but a small debt yet remains on the last works, and the parish is extremely poor. Outside help is, therefore, greatly needed, and the rector—the Rev. W. O. Purton—or the churchwardens would gratefully acknowledge any donation to the restoration fund. R. Owen Allsop.

NEW PAVILION, SOUTHEND PIER.

THIS pavilion has just been erected, from designs of Messrs. Brunlees and McKerrow, of 12, Victoria-street, Westminster, by Mr. J. T. Chappell, 149, Lupus-street, Pimlico. It is one of the many of which the covering has been executed by Messrs. Holden and Co., of Wood-street, Westminster. The whole of the roofs, turrets, tower, and other ornamental work has been done with Vieille Montagne zinc, upon their patent unsoldered system.

THE METROPOLITAN WATER SUPPLY.

THE Select Committee on the Metropolis Water Supply Bill have presented their report to the House of Commons. They state that they have proceeded upon the assumption that, in the opinion of Parliament, it is desirable to establish a single public representative water authority for the metropolis. Since the reports were made to this effect by Royal Commissioners in 1869 and 1880, much valuable experience has been gained of the growth of population, and of the undertakings of the water companies and the demands upon them. Parliament also, since 1886, has adopted the policy of enforcing more stringent provisions in case of the issue of any fresh capital. An important inquiry into the whole matter, too, has recently been held by the Corporation of the City of London. The committee, therefore, consider it to be most desirable that the problem should be examined by the London County Council, in the interests of the water consumers of the metropolis. They recommend—1. That powers should be granted to the London County Council to expend such further sums as may be necessary, in order that they may examine thoroughly for themselves the whole position of the metropolitan water supply. 2. That, if they should so resolve, they should have power to promote a Bill or Bills in Parliament for the purpose of constituting themselves the responsible water authority for London, acting either wholly by themselves or partly in conjunction with the Corporation of the City of London on behalf of both bodies. 3. That the London County Council, if constituted the water authority, should be required to purchase, either alone or in conjunction with such of the authorities of the outside areas as may be arranged, the undertakings of the eight water companies (except possibly certain lands of the New River Company) by agreement, or, failing agreement, by arbitration, within a fixed period. 4. That, subject to any such arrangements, the new water authority should take over the duties and obligations which the present water companies now have towards the consumers of water in the districts outside the boundaries of the county of London, but within the limits of supply of the present companies. 5. That in the event of purchase by the new authority, power should be given to that authority, and to the authorities of the outside areas, to negotiate for the purchase by the latter (1) of so much of the works of distribution as is appropriated to the district of such local authority; or (2) possibly of some of the sources of supply. 6. That those local authorities which, like Croydon, Richmond, and Tottenham, are situated within the metropolitan water area, but have their own independent water supply, should, in the event of the purchase of the water companies by the new water authority, be guaranteed in the exercise of their present rights. In the event of the undertakings of the companies not being acquired by purchase, the committee recommend that there should be a Parliamentary inquiry into the statutory powers and obligations of the water companies, and the control now exercised by public departments and and the metropolitan and other authorities over them.

ROYAL ACADEMY ADMISSIONS, JULY, 1891.

Students Upper School.—H. C. Corlette, J. Paxton, J. S Stewart, A. F. Usher, E. W. Wonnacott.

Probationers.—E. R. Barrow, H. Bulman, A. J. Forge, A. Hill, C. O. Law, H. Tarbolton, J. H. Tyars.

CHIPS.

The builder's workshops in Silver-street, Scarborough, belonging to Mr. W. E. Adamson, were destroyed by fire on Thursday night in last week.

Thomas Roe, a joiner in the employ of Messrs. R. Neill and Sons, of Salford, fell, on Friday, from a building which is in course of erection in Moreton-street, Strangeways, and was killed. At the inquest, held on Monday, a verdict of accidental death was returned by the jury.

Lady Charlotte Schreiber, who is well known for her many presents to the South Kensington Museum, has deposited in the British Museum an interesting series of fans. The collection has been placed in the Printroom.

The will of Mr. John Burlison, formerly of 33, Oxney-crescent, Highgate-road, glass painter, who died on May 3rd, has been proved, the value of the personal estate amounting to upwards of £24,000.

The West Cliff hotel and boarding-house, Southend-on-Sea, was opened last week. The hotel contains 90 rooms, and has been built from plans by Mr. M. V. Treleaven, of Acre-lane, Brixton, architect.

The new town hall at Selby was informally opened last week. The building, which has been erected from the designs and under the superintendence of Mr. W. H. Thorpe, of Albion-street, Leeds, is in the Domestic Gothic style. On the ground floor are a committee-room, surveyor's office, and fire-station, whilst on the first floor is a board-room, 26ft. long and 16ft. 6in. wide, as well as clerk's office.

The Prince of Wales unveiled last week in Waterloo-place, Pall-mall, the statue which has been erected by public subscription to the memory of the late Lord Napier of Magdala. The statue, which is of bronze, was commenced by the late Sir Edgar Boehm and completed by Mr. Albert Gilbert, A.R.A., and represents the late Field Marshal on horseback, with a field-glass in his right hand.

The parish church of Nicholaston, near Swansea, is about to be restored. Messrs. Halliday and Anderson, of Cardiff and Llandaff, are the architects.

A new Conservative Club at Guildford was opened on Wednesday week. Mr. A. J. Sturges was the architect, and Messrs. Smith and Sons were the contractors.

The ancient church of Thelwall, near Warrington, is being enlarged. An aisle has been added on the north side, and the foundations of a porch have been laid. The interior of the edifice has been refitted with new sittings, and the floor relaid with wooden blocks. The building will be ready for reopening in about a month.

Our Illustrations.

R.I.B.A. PUGIN STUDENTSHIP DRAWINGS.

THESE studies by Mr. John Begg, which we reproduce to-day, formed part of the series which he executed during the past year as Pugin Travelling Student. The first shows the tower of Kettering Church from the N.E. A view of the same building from another point of view, and drawn by Mr. J. A. Gotch, F.S.A., will be found in the BUILDING NEWS for Aug. 18, 1882, with many other studies of old work in Northamptonshire, published in connection with our report of the Architectural Association excursion to Kettering and the neighbourhood. A monograph of the church at Kettering was published in 1843 by R. W. Billings, with twenty steel plates, which are still useful for reference. This year Sir Arthur Blomfield, A.R.A., has been restoring part of the church. Mr. Begg's plan, printed with the accompanying view, shows how quaintly the tower on plan sets with regard to the nave, and the anglewise porch on the north is curious, and slants rather unusually. The porch and tower are canted in this way, they say, in order that they may face the approaches to the church from the town. The church is principally "Late" in character, of ordinary type, and the chief interest is comprised in the tower and spire, one of the finest in the county. The date is stated at about 1450. The hexagonal turrets, rising over the too-thin buttresses of the tower, rest on a bold corbel table and cornice, and group well with the springing of the crocketed spire, which has been compared to that of Oundle, a near neighbour in the same county. The Founder's Tower at Magdalen College, Oxford, is the second subject delineated by Mr. Begg's facile pencil. This beautiful part of these famous university buildings is as familiar as the great Magdalen tower, and facing it are the new lodgings erected by Messrs. Bodley and Garner, who have imitated the detail of the old work so closely as to have repeated the open ribbed stone arch which springs from the outer member of the gateway of this tower. The delicately treated oriels, so flat in their projection and yet so effective, have also been cleverly copied, while the carving is perfectly excellent. When the Architectural Association visited Oxford last August, we gave several Oxfordshire sketches, and a lengthy description will be found in the BUILDING NEWS of that date.

ST. MARY'S CHURCH, BRADING, ISLE OF WIGHT.

MR. PERCY G. STONE, F.R.I.B.A., is bringing out an interesting work* illustrative of the architectural remains of the Isle of Wight, the buildings of which deserve a more thorough representation than they have hitherto received from the hands of the architect and the antiquary. We have now before us the first part of the book to which we refer, and to-day among our lithographic sheets will be found one of the plates reproduced by way of a specimen page, thus enabling our readers to judge more nearly the character of the illustrations with which Mr. Stone has enriched his publication. The author, in arranging his subjects, has taken the Medina River as the natural division, subdividing each medine into ecclesiastical and domestic periods, following an alphabetical order, and treating the East and West Medine separately as Parts I. and II. The frontispiece is devoted to a reproduction of Speed's map of "Wight Island," dated 1611, and including detail maps of Southampton and Newport as they existed at that period. A further diagram map of "the Wight" is printed, showing how it was known in the 14th century. An introductory chapter furnishes an admirable account in brief of the history of the island down to the present day. Each building illustrated has a well-written description devoted to it, and its history is traced through the several centuries so far as knowledge will allow, with inventories, inscriptions, and indexes of use for reference. Arreton Church, with its massive western tower and pretty nave, and chancel arcades, occupies the first few plates; then the chancel of Binstead, dedicated to the Holy Cross, is shown, followed by St. Boniface Church at Bonchurch; Brading Church, the subject which we have selected for representation, comes next. According to tradition, it is the most ancient foundation in the island, having been established by Wilfrid, Archbishop of York, under a grant from his convert, Ceadwalla, King of Wessex, the conqueror of the "Wyght" in 686. In all probability the church was founded and endowed by the Azor or De Insula family, about the middle of the 12th century, and one of the earliest rectors was John de Marisco, one of the De Insulas, who held the living some time before 1247. Their descendants, the Lisles and De Aulas, held the patronage till it passed into the hands of the Prior and Convent of Wenlock, in Shropshire. The building itself consists of a nave of five bays, with north and south aisles, a chancel with north and south chapels, and a tower at the west end surmounted by a broached spire with a decided entasis on its outer face. The nave is the oldest part of the church, dating from the close of the 12th century. The lancet window at the end of the north aisle is the only remaining evidence of the aisles erected in the 13th century. The chancel is described by Mr. Stone as being of this period, and of the same date as the tower; but the drawings hardly illustrate any of the parts of the fabric which indicate this fact. The tower is unusual, inasmuch as it stands on four piers, inclosing an open porch. In the Oglander Chapel and the De Aula Chapel there are some important monuments, notably that with the effigy of Sir William Oglander, and the incised slab of Purbeck stone standing in the sacrarium on the south side of the altar. "A fayre stone, with ye pourtraiture of a sowldier on it." Under a rich architectural canopy lies the full-length figure of the "sowldier," supported on two dogs, and his hands extended as if in prayer. The Latin inscription tells the reader that "Here lies the noble John Cherowin, Esquire, during his life Constable of Porchester Castle, who died October 31st, 1441. May his soul rest in peace; Amen." The matrices for the hands, the helmet, and sword-hilt are now blank and empty. They were presumably filled with metal or mastic. In the belfry are eight bells with inscriptions. The building was re-seated and restored in 1865. The small view, which we have reduced from one of Mr. Stone's single plates, and incorporated with our illustration, shows the church and old town hall from the south-west. The tombs which we have mentioned are all fully illustrated in the book. Among the other plates in this folio are views and drawings of Godshill Church, with its tombs and furniture; St. Helen's Tower; St. Lawrance-under-Wath; New Church; Niton; Quarr Abbey, which is fully illustrated and learnedly described; Shanklin Church; Whippingham Church; Whitwell, Wootton, and Yaverland Churches. The book is excellently printed, and the photo-lithographic plates are by Mr. James Akerman, which is an evidence of their crispness and sharpness of line. The other parts will, we understand, include the manor-houses and historical domestic work of the Island.

* The Architectural Antiquities of the Isle of Wight from the XIth to the XVIIth Centuries. Collected and drawn by PERCY G. STONE, F.R.I.B.A. London: 16, Great Marlborough-street, W.

TWO CHIMNEYPIECES.

WE are enabled this week to reproduce two minor examples of the work of the late Mr. W. Eden Nesfield, whose premature death deprived the profession of one of their most distinguished colleagues. The two chimneypieces which we illustrate were executed for Cloverley Hall, Shropshire,* a large mansion built for the late Mr. John Pemberton Heywood, of which Mr. Nesfield was the architect. The upper chimneypiece on the page is in the library, and is executed in russet marble and wainscot oak. The lower one is in the entrance hall. The sculptured panels in the frieze contain illustrations of some of Æsop's Fables. The material is Portland stone. These, with others in the principal rooms, together with all the sculpture and carving on the mansion, were carried out by Mr. James Forsyth, sculptor, of Finchley-road, under Mr. Nesfield's direction.

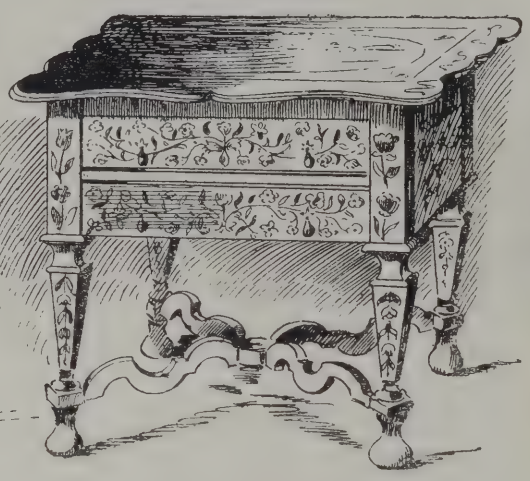
SCULPTURE AT THE ROYAL ACADEMY.

IN continuance of our series of sculpture exhibits from the present Exhibition of the Royal Academy, we give to-day another double-page plate. The first subject is a refined and elegant statuette and fountain, shown in the Lecture Theatre by Mr. T. Nelson MacLean, entitled "La Source," in pure white marble. The central group is from the masterly chisel of Mr. Henry A. Pegram, and with a dignified picturesqueness represents the certainty of death. The title is "Sibylla Fatidica." Mr. T. Brock, R.A., in a lighter mood and with graceful fancy, gives us a life-size marble statue, emblematic of "Song." The fair maid, in an easy pose, holds a scroll ribbon, and with a light heart, seems to render her melody.

HOUSE AT LARBERT, N.B.

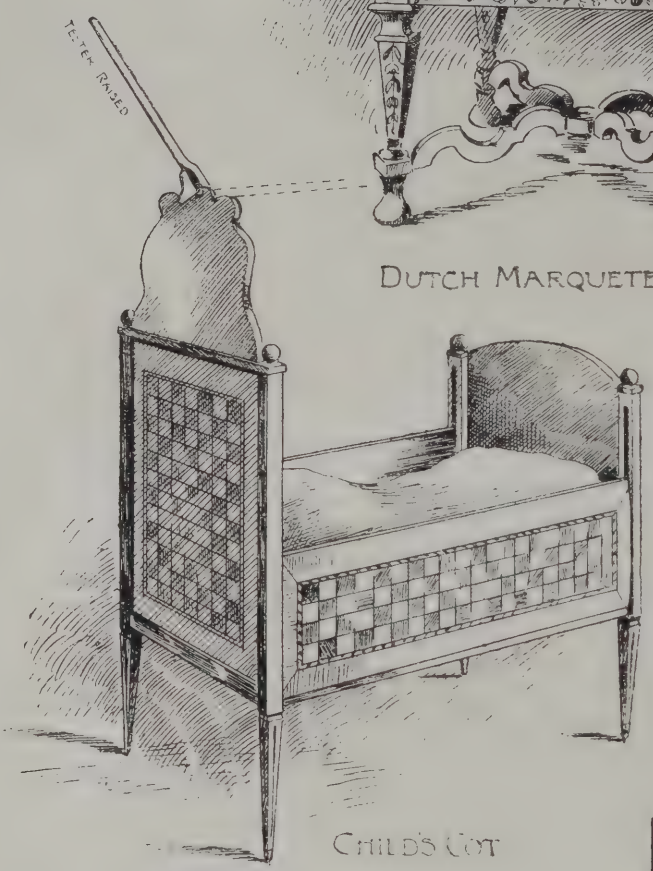
LARBERT is an old Scottish village and parish, once traversed by the Roman-road from Falkirk to Stirling, of which traces are still to be seen. It is twenty miles from Glasgow, with which it is connected by thirty trains daily each way, and is growing into a favourite residential neighbourhood. "Woodcroft," erected for Mr. George Sherriff, is finely situated on an estate recently opened for feuing, and commands beautiful views of the Ochils and the Carse of Forth. Larbert is not far from one of the principal quarry districts of Scotland, and the house is built of the fine local freestone, and covered with dark red roofing tiles from an Alloa manufacturer. The timber framework which enters into its construction is of teakwood. The drawings from which our illustration is taken are shown in the current Royal Academy Exhibition, the architect being Mr. T. L. Watson, F.R.I.B.A.

THE LATE COL. HAMBRO'S FURNITURE.



THE Table at the head of this sheet of sketches is oblong, with moulded and shaped top; the surface of which, like the front and sides, is richly inlaid with marqueterie. Two drawers occupy the whole width between the legs, the latter being strengthened with curious stretcher. The Cot is an interesting piece depending for its effect on its simplicity of design and nice workmanship: the head, foot, and sides are inlaid with panels of square parqueterie, with narrow border; the shaped head is fitted with hinged tester. The Boudoir is a dainty piece of furniture of satin-wood with inlaid borders, suitable for keeping knick-knacks in. The Sheraton Corner Cabinet is made in mahogany inlaid with satin and other woods, and containing cupboard with folding doors, three drawers, and delicately shaped shelf below, and three tiers of shelves above. The satin-wood Writing-table is one of those ingenious devices of the cabinet maker, which contain more than at first meets the eye. Thus the back of this piece is ornamented with a mirror below the desk, but which is capable of being raised for toilet and other purposes; also, by the pressure of a spring, the sides are found to conceal trays for containing writing materials. The table is inlaid with festoons of foliage, &c., has a leather top, long drawer, and shelf cut away for legs of user.

Ripley Church, Surrey, was reopened last week after renovation, carried out by Mr. J. Puller, builder, of that village.



* A view of Cloverley Hall was published in the BUILDING NEWS, June 3, 1881.

THE HIGHGATE DAIRY.

THIS old-established dairy, dating from 1707, is situated in South-grove, Highgate, on the top of the hill, and forms part of the Hawkins Estate. It has been recently rebuilt for Mr. Chas. Davies, the leaseholder, from the design of Mr. Ernest H. Abbott, of the firm of Bray, Young, and Co., of 6, Warwick-court, architects and surveyors. The drawing shows the front elevation facing South Grove. The buildings comprise dairy, can-room, cowsheds for 30 cows, stables for four horses, offices, &c., in the rear, the whole of which have been constructed upon the most modern sanitary system. The shop at the corner, lined throughout with tiles, is for the sale of dairy produce. The dwelling-house contains two sitting and six bedrooms, bath-room, kitchen, offices, &c. The two residences adjoining each contain two sitting and four bedrooms, bath-room, kitchen, offices, &c. The elevation of the whole block is faced with pressed red Leicester bricks, moulded cornices, stringcourses, &c., and the gables are rough-cast. The roof is covered with green Welsh slates. The works have been carried out at a cost of about £3,000, by Messrs. Scharien and Co., of Chelsea.

MUSIC-HALL CONSTRUCTION.

THE New York Music Hall, plans and particulars of which are published in the *Engineering Record*, is an important structure of its class, under the direction of the Music Hall Company of New York, situated at the corner of South-avenue and Fifty-seven-street. Brick and terracotta have been mainly used, the latter for the decorative features. A vestibule 70ft. long and 25ft. high, vaulted nearly the whole length of one front, is at once spacious and imposing, leading from which are five main doorways into the building. The hall accommodates 3,000 seated, with standing room for 1,000 more. A corridor surrounds the building, and has nine exits. Above the parquet, which holds 1,000, are two tiers of boxes, the dress-circle, and balcony. These tiers do not all stop at the proscenium, as usually seen, but successively terminate at points in the side walls shorter and shorter, the upper gallery terminating the farthest back from the proscenium, so that the fine ceiling can be fully displayed. The heating and ventilation, which are fully described in our contemporary, are on the plenum-vacuum system, both blowers and exhausters being employed. Fresh air is admitted through perforations in or near the ceilings, passing downwards through the hall and rooms, and made to escape through exhaust registers near the floor and in the risers. Ten million cubic feet of air per minute are admitted, being at the rate of a complete change of air six times per hour. The area of inlets and outlets amounts to 2,000sq.ft., thus bringing the velocity of air to about 1ft. per second, avoiding draughts. The details of the system are fully described and illustrated in the *Record* to which we refer. One of the chief features of the structure is the plan of stage, which is parabolic, or arranged on the principle most favourable for the propagation of sound. The section of hall is also designed on the same principle—that is, like a wind instrument. Over the orchestra or stage the ceiling is low, and gradually expands to the proscenium arch. Another similar ceiling, though higher and larger, is in front of this, and the auditorium is still higher, and forms a vault, so that the sound is reinforced at its commencement by the confined walls and low ceiling over the stage, gradually expanding as it vibrates outwards.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Glasgow Architectural Association.—The monthly meeting was held on Tuesday week—the president, Mr. William J. Anderson, in the chair—when a paper on "English Renaissance" was read by Mr. John White. The Revived Classic style that had its birth in Italy made, he said, its appearance in England towards the end of the 16th century. First seen in tombs at Westminster and elsewhere, it was before long employed in the princely mansions that the affluence of the period called forth—such as Longleat and Wollaton. English Renaissance is, however, seen at its best in the more modest country houses, the tombs and monuments to be met with in every old church, and the county court houses. A discussion followed the reading of the paper, opened by Mr. John Arthur.

Leicester Master Builders' Association.—The first annual dinner of this association was held on Friday, when prominence was given in many speeches to the new departures in the relations of the corporation, and especially of the borough surveyor's department, to the trade. Mr. E. G. Mawbey, who was one of the guests, referred, in his speech, to the fact that he had himself commenced his career in the establishment of a Leicester builder, and announced that his department had decided to advance the wages of its men to the full standard adopted by the Association.

The Royal Archæological Institute.—The annual meetings of this Institute will take place at Edinburgh in the week between Tuesday, the 11th, and Tuesday, the 18th of August. The president of the meeting will be Sir Herbert Maxwell, M.P. Mr. John Evans, president of the Society of Antiquaries, will preside over the antiquarian section; the Bishop of Carlisle over the architectural section; and Dr. T. Hodgkin over the historical section. The sectional evening meetings are to be held at the National Portrait Gallery. Amongst the places to be visited during the week are the Royal Palace of Holyrood, the Castle of Edinburgh, Stirling Castle, Dunblane Cathedral, Linlithgow Palace, St. Andrew's, Dunfermline, Rosslyn Abbey and Castle, Borthwick Tower, Crichton, and Hawthornden; a day will be devoted to the caves of Fife, and another to the Roman wall near Glasgow. On the last day a visit will be paid to the new Forth Bridge.

Waterloo-road Chapel, which has been closed for renovation, was reopened on Sunday last. The building, which was sorely in need of it, has been very successfully ventilated on Messrs. R. Boyle and Son's system. The works were executed by Mr. Vanstone, of White Hart-street, Strand.

An application was made on Wednesday in last week to Mr. Registrar Giffard, in the case of W. H. and F. Croaker, builders and contractors, of Great Dover-street, for the approval of composition resolutions accepted by the creditors. The liabilities returned were at £52,694, of which £13,998 will probably rank, and by the proposed scheme the debtors agree to pay a composition of 10s. in the pound by four equal instalments, security being provided. The Official Receiver reported that the proposal was reasonable and calculated to benefit the creditors. Mr. Registrar Giffard granted the application and rescinded the receiving order.

WAYSIDE NOTES.

HANOVER CHAPEL is doomed to destruction, if a majority of sixteen in favour of a second reading of the Bill for its demolition can at all be taken as foreshadowing the final result of the introduction of this measure into Parliament. We shall not break our hearts over the matter. The chapel has a pleasing façade to Regent-street, and is of some little interest as being one of the few buildings creditable to the Classical mania which, with all its minute copyism, generally failed to produce anything but crude caricatures of the architecture of the ancients. In the Hanover Chapel portico, we have, if not all the refinement of Grecian architecture, yet something worth looking at, waiting to be discovered beneath much dirt and deposits of London soot. Nowhere in England shall we find better executed specimens of the Asiatic variety of the Ionic base—a piquant feature of Classical architecture hardly appreciated at its true worth by modern architects, unless, indeed, it be that while admiring its noble proportions *per se* and admirable effect *in situ*, they perforce neglect to imitate it on account of the multiplicity of its mouldings, and the consequent running up the item of "circular moulded work" in the bill of the matter-of-fact quantity surveyor.

But what cares Parliament for refined architecture, let alone Asiatic or other bases? Well, in the case of the Hanover Chapel, perhaps something more than usual. The figures on the division for or against the second reading of the Bill were—for the second reading, 107; against, 91; so that had a two-thirds majority been required—as would not seldom be an advantage in Parliament—the Bill would have been thrown out as it deserved to be. The above figures are unusually encouraging, as they show that large numbers appreciate the chapel, and fail to see the case made out for the removal of the building. In fact, there is absolutely no case. A certain number of persons would find it to their benefit to have the room rather than the company of the chapel. If they said so plainly, it would be more honest. To say that the chapel is an obstruction to traffic in Regent-street is a subterfuge, and if the arguments advanced as to the small attendance at worship in the building are to hold good, then about two-thirds of the places of worship in more central parts of London may as well be pulled down to-morrow.

The competitive designs for the completion of the South Kensington Museum will in all probability be open to public inspection in the course of a week or so. On Monday it was stated that the plans had been forwarded to Mr. Waterhouse, the assessor, who would complete his examination this week. Next week it is expected that the committee will make a selection of the designs, so that it should not be long before the official business will be completed, and the plans exhibited. South Kensington has been named as the probable place for the public exhibition. It would certainly be the most suitable site for the display of the drawings, which should prove of particular interest to the profession.

According to the Census returns, the inhabited houses of England and Wales number 5,452,802—an increase of 621,283 upon the numbers returned in 1881. The uninhabited houses, and houses in course of construction, on the other hand, have declined, there being 380,117 returned of the former, and 38,407 of the latter. In 1881 the numbers were respectively 386,672 and 46,414. The returns show the average number of occupants of each inhabited house to be 5·32, against 5·38 in 1881, and 5·33 in 1871. We chiefly learn from these statistics that there were considerably more houses in course of construction in 1881 than at the present time, and that the population has a rather larger proportion of homes than at the last census-taking. Some of the facts brought to light by the present returns are a little curious. On first thoughts, for instance, one would not allow that the population of Croydon was 102,697, while Brighton was only 115,402. This is really astonishing. Presuming West Brighton or Hove to be included in the Brighton returns, then it seems something more than remarkable that the numbers should only exceed those of Croydon by some thirteen thousand persons, even if Croydon includes Waddon and other outlying places. Norwich has got into the hundred thousand stage, the exact figures being 100,964. This East-Anglian city, always flourishing, is going ahead yet. In 1881 the census returns showed only 87,841. Liverpool has gone back—it is the only instance in sixty-two towns of over fifty thousand inhabitants where decrease is evidenced—517,951 persons as against 552,508 in 1881. Liverpool, however, yet ranks second only to London. Manchester is returned at 505,343; Birmingham, 429,171; Leeds, 367,506; Sheffield, 324,243; and then we come to the West of England city, Bristol, with 221,665 inhabitants. The last return of Bristol appears to have been 206,874. It is evidently a flourishing place. Bradford follows with 216,361, Nottingham 211,984, and after West Ham, strangely returned by itself at 204,902, we drop below the two-hundred thousand. It may surprise many to know that Kingston-upon-Hull, with 199,998 inhabitants, is ahead of Newcastle-upon-Tyne, 186,345. Salford comes between the two latter towns, and has a population of 198,136. 505,343 + 198,136 = 703,479 is the population of Manchester and Salford, forming together the largest congregation of people in England next to the colossal 4,211,056 of London, which forms the nucleus of the 29,001,018 souls, all told, in England and Wales.

If Liverpool has declined during the past ten years, what will it do in the next decade, if the ship canal answers the expectations of its promoters? It is difficult to get trade away from old grooves; but doubtless much cotton will go through to Manchester direct, and not be handled in Liverpool. At the canal works, by the bye, they have had some trouble in regard to the portion of the work to which I last week alluded. Early on Sunday morning last, an embankment at Ellesmere Port gave way, and, up to the time of writing, no commencement had been made with the reparation—in a permanent manner — of the breach made by the tidal waters of the Mersey. The embankment that was destroyed was constructed hurriedly, but it is said to have appeared very substantial, and to have contained some ten million tons of timber and stone, &c. On Monday a second temporary embankment was constructed, only, however, to give way as before. Now the engineers have found that "the longest way round is the shortest way home," and resolved to do the work thoroughly by the gradual erection of a dam of stronger material. As a consequence of this unfortunate accident, the opening of the Eastham section of the Canal has been delayed, and the company has been put to some expense by the interruption caused to the Shropshire Union Canal traffic. As the Ship Canal Company under their Act are liable for a £100 fine every tide the Union Canal traffic is interrupted by the Ship Canal works, one cannot blame the engineers for their haste to construct the embankment; but they have doubtless had cause to reflect since the washing away of the two plum-pudding-like embankments, that principles of dam construction which answer well enough with children's spades on the sea-sands, are not successful in stern reality.

The recommendations of Sir Matthew White Ridley and his colleagues with regard to the water-supply of London, are not such as will meet the views of all who have considered this question. It is suggested that the County Council be made the central authority, in conjunction with a committee appointed by the Corporation of the City of London. The County Council, as we know, would be only too glad to get the water supply into their hands. There is a spice of humour about the recommendation of Sir Matthew's that the County Council should be empowered to hold an inquiry as to whether it (the Council) should or should not become the water authority! If there is any doubt as to what a hungry dog would do if it had to decide whether or no it should have a bone, then there is also doubt as to the result of any inquiry by the County Council as to who should deal with the Metropolitan water supply. It still seems to me that the Council has duties enough to perform at the present time without taking on its shoulders the water supply, which would be best left to special commissioners or a new water trust; and I should say this was the more certain if the Council are going to take over the tramways of London, as there is some talk of their doing. One thing appears to me as very evident in this question of the water supply of London, and that is that nothing has yet been suggested that is a genuine, striking improvement on old ways and means, and that until such is forthcoming the water companies had best be left to their businesses as heretofore.

I think corporations should treat their workmen to a holiday, or let them pay for it themselves. They certainly ought not to allow their officials to send out cadging appeals, much as some printers and newspaper offices do to their customers. It is all nonsense for *Truth* to call such letters as that here given "little better than an attempt to blackmail"; but they are decidedly ill-advised:—

DEAR SIRS,—The workmen in the employ of the Southampton Corporation propose holding their annual outing on July 23, and have requested me to ask you if you would be kind enough to give them a subscription in aid of the same.

I may add that the greater portion of the expenses are borne by the officials and tradesmen of the town.—I am, dear sirs, yours obediently, A. D. GREATOREX, Assistant Borough Surveyor.

Mr. Greatorex is probably, at cost and trouble to himself, doing his best to make the men's outing a happy one; but such appeals ought not to be sent to firms with which the corporation does business. GOTH.

PRICES.—X.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

SHADOWS.—X.

We will next determine the shadow of the entablature of the Doric order. We must carefully draw both plan and elevation, and from the corresponding points in each, draw the shadow line at 45°. As before, the projection of the lines from the plan, and their intersection with the lines in the elevation, will give us the various points and lines for the construction of the shadow. A B will be the form of the shadow of the moulding from A to B, C C the shadow thrown by the projecting (modillion) C C, casting also a part of its shadow on the upper portion of the frieze. The modillion D throws a projecting shadow at D D. The architrave E G G E forms the shadow E G G E. The shadow, although appearing simple, must nevertheless be carefully constructed.

At Fig. 34 we have an Ionic capital, of which we wish to find the shadow thrown against the wall plane. At the points of tangent to the volutes A, B, A B and *a b*, &c., we draw the shadow lines at 45°, their intersection will give us the traces of the shadow of the containing parallelograms A B, A B, &c. Within these we may indicate the curve of the volutes. With a little care the remainder of the shadow of the capital is easily found by following the ordinary rules.

The consecration of the Roman Catholic Church of Our Lady and All Saints', Stourbridge, took place on Friday. The church, which is one of fine proportion and architecture, built from the designs of Mr. E. Pugin, was opened as long ago as 1854; and since then important accessory work has been carried out, the last thing receiving attention being the decoration of those parts of the interior of the church which had not hitherto been dealt with. The consecration of the church has stood over till it should be entirely free from debt. From first to last the church and the other buildings grouped near it have cost some £10,000. The whole of the decorations have been carried out by the same artist, Mr. R. Jeffrey Hopkins, of Abergavenny.

THE LONDON CARPENTERS' STRIKE.

THE outlook in the great struggle between the metropolitan master builders and their carpenters, now in the twelfth week of its acute stage, appears much more favourable to the men's ultimate success than it did a fortnight or so since. Following up the withdrawal of all hands from 29 firms which had hitherto taken no part in the dispute, the joint committee have this week drawn men out of thirty-one other firms. Of these sixty firms, thirty-three have thus far conceded the terms demanded, a 47 hours week and 10d. per hour, so that the number of men to be supported by the committee has been only increased by 600, and is still under 3,000. Funds are coming in steadily from the provinces, and the Amalgamated Society of Engineers has issued a circular to members asking for a vote on the question of making 3d. per week levy on each member till the strike ends. The mill-sawyers and wood-cutting machinists, at a meeting held in Bishopgate-street on Monday night, decided to give six days' notice to the master builders that, unless the carpenters' proposals were conceded, they should also cease work. Mr. T. Chandler, of Manchester, general secretary to the Amalgamated Society of Carpenters and Joiners, has been in London, accompanied by Mr. R. Day, chairman of council, inquiring into the working of the pickets and other arrangements.

At the Hyde Park demonstration in favour of the eight hours movement on Sunday afternoon it is estimated that 10,000 persons were present, and a resolution expressive of sympathy with the carpenters and joiners now on strike or locked out, proposed by Messrs. Matkin and Bachelor, was carried unanimously.

At the Marylebone Police-court, on Saturday, Francis George Burton, carpenter, was summoned by his employer, Mr. Edward White, for having absented himself from work without notice. Defendant, in lieu of payment by the hour, was paid a weekly salary of forty-five shillings, the engagement to be terminated by a week's notice on either side. At the commencement of the carpenters' strike Burton left without notice, and his employer sustained damage by non-completion of work and loss of orders. Mr. Cooke granted complainant £5, under the Employers' and Workmen's Act, for the damage thereby sustained.

At St. Helen's, Lancashire, the dispute in the building trades is in a fair way to being settled, both sides having agreed to refer the matter to arbitration. At Norwich the strike among carpenters, joiners, and bricklayers ended on Saturday, when the men unanimously decided to return to work at the advance of ½d. an hour offered by the masters a fortnight previously, and then rejected by an overwhelming majority.

The Prince and Princess of Wales will open the Victoria Law Courts at Birmingham on Tuesday next. The buildings, which have been erected from the designs of Messrs. Ingress Bell and Aston Webb, were illustrated in our issue of August 13, 1886.

On Saturday afternoon a Baptist chapel, which has been erected at the corner of Jenkins-street and Coventry-road, Small Heath, Birmingham, was formally opened. The new building is 52ft. long by 72ft. wide, and has an open-timbered roof. The style is Gothic, but the front has been plainly treated, in view of future extensions. Accommodation is provided for 700 people, as compared with 500 in the old chapel. It is proposed ultimately to attach to the chapel a lecture room and a suite of class-rooms for children. The total cost of the building and freehold site is about £5,000. The building was erected by Mr. T. Johnson, Nechells, to the designs of Messrs. Ingall and Son.

New waterworks constructed to supply a population of 13,000 in the district of the local board for Audley, Staffs, were opened on Wednesday week. The supply is derived from a shaft 104ft. deep, sunk at Mill Dale, Balterley, and the cost has been £15,000. Messrs. Ford and Slater, engineers, Burslem, prepared the plans, and the work has been carried out under the superintendence of Mr. Joseph Cope, of Talk-o'-th'-Hill, acting as clerk of works. The contract for the various works have been carried out at the Union Foundry, Kidsgrove, for the engine, boilers, pumps, rising main, and distributing mains; by Mr. Renshaw for the high service reservoir; by Mr. Bowden, of Burslem, for the engine and boiler houses and chimney stack; and by Messrs. Smith and Taylor for the foundation for reservoir and for a weir in the brook.

Building Intelligence.

CHEETHAM, MANCHESTER.—A new out-patients' department and dispensary buildings are about to be erected in York-street, Cheetham, for the committee of management of the Clinical Hospital for Women and Children, situate in Park-place, Cheetham. The buildings will occupy the site of two large houses adjoining to the Jews' Synagogue, York-street. The back portion of the premises will be pulled down, and on the site will be erected a dispensary, including a large waiting-room 49ft. by 31ft. The front portion of the premises will be adapted so as to provide consulting and waiting rooms for the medical and surgical staff. The elevation to York-street will be in terracotta of English Renaissance type. The cost of the new portion and the alterations will be about £2,000. The architects are Messrs. Mangnall and Littlewoods, and the builders Messrs. Wilson and Toft, all of Manchester.

ST. PANCRAS.—At the last meeting of the St. Pancras Board of Guardians a letter was read from the architects (Messrs. A. and C. Harston) reporting that the builders are not progressing with the works with sufficient expedition, and as to the manner in which the builders disregard their directions; and stating that in accordance with the terms of the contract the Guardians are empowered to dismiss and discharge the contractors from the further execution of the works, they not having complied with the notice served upon them on the 11th of June, requiring them to remove certain brickwork in accordance with the specification. The architects add that as the matter now stands, either they (the architects) must abdicate all control and responsibility in connection with the works, or the Guardians must exercise the power vested in them. A long discussion ensued, and the following resolution was agreed to:—"That the clerk be instructed to inform the contractors that the Guardians must insist upon the works being executed strictly in accordance with the contract, and in compliance with the direction of the architects."

Engineering Notes.

KINGSTON-ON-THAMES.—The water supply for Nunhead and district is obtained from Hampton, being pumped thence by the Southwark and Vauxhall Water Company through some 15 miles of iron main and stored for distribution in the reservoir at Nunhead. The supply of water has recently had to be increased, and this has been done under Mr. J. W. Restler, the engineer to the water company, by laying a second main from Hampton to Nunhead. This involved the construction of an iron subway under the Thames just below Kingston Bridge, which subway has recently been completed. It is circular in section, 9ft. diameter, and is constructed of cast-iron plates 1in. thick and bolted together in segments forming rings 18in. deep. The method employed in driving the tunnel and fixing the plates was similar to that adopted in the construction of the City and South London Electric Railway. An iron shield of slightly larger diameter than the subway itself was forced forwards into the clay by powerful hydraulic jacks for a distance of about 18in., sufficient to insert one ring of the cast-iron plates. These plates were then fixed and bolted together in position and the shield again impelled forward as before. By these means the earth in the tunnel was taken out as nearly as possible to the precise dimensions of the iron rings to be inserted. In order, however, to make the work perfectly solid and secure, a grouting of liquid cement was forced in behind and around the rings when finally fixed, thus filling up every possible fissure and crevice between the iron and the surrounding clay. The subway is 600ft. long under the river, and it has been completed in the short space of nine weeks. The whole length of the tunnel is in the London clay, and at one point the thickness between the top of the subway and the bed of the river is only 2ft. 6in. The cast-iron main, of 42in. diameter, which conveys the water from Hampton to Nunhead, is divided in the tunnel into two pipes of 31in. diameter each. The work has been carried out by Messrs. John Aird and Sons as contractors.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., LVII. LVIII., and LIX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. A. and Son—J. E. and Co.—B. and B.—L. D. Co.—L. S. B.—J. L. and Co.

Correspondence.

PARAFFIN-COPAL MEDIUM FOR MURAL PAINTING.

To the Editor of the BUILDING NEWS.

SIR,—In the BUILDING NEWS of last Friday there is a paragraph (on page 40) which attributes to Mr. Reynolds Stephens not merely the selection of the paraffin-copal medium for his mural painting in the Royal Academy, but its invention. I am sure that my friend, the artist you name, has himself made no claim of this sort. I described the medium in question and its advantages in a lecture to the Architectural Association in 1862; but even so early as the year 1859 I mentioned, in a paper read before the Oxford Architectural Society, my first trials of paraffin-wax in painting. The medium and its preparation and employment are discussed in my "Chemistry of Paints and Painting" (Seeley and Co.).

It should be added that a pure paraffin-wax, having a melting-point of 140° to 150° Fahrenheit is required for this medium. Mr. A. P. Laurie, Fellow of King's College, Cambridge, now prepares my paraffin-copal medium, and it, along with the pigments known as the "Cambridge Colours," are to be obtained of several agents.—I am, &c.,

A. H. CHURCH, F.R.S.

Shelsley, Kew Gardens, July 13.

ARCHITECTURAL TURNSPITS.

SIR,—The case of "Cutler v. North" reminds us that whenever an architect is roasted, some other architect is always ready to turn the spit. That is the difference between the architectural profession and the medical one; and that, too, he

to account for the different valuation which the public puts on its architects and on its doctors.

There is, however, no accounting for tastes, and a note in one of the professional journals of last week shows that in some people's estimation the office of architectural turnspit is an honourable one. Let us honour, then, those to whom honour is due, and let every gentleman who has filled this honourable office be distinguished for ever after by the letters "A. T. S."—I am, &c.,

X².

Intercommunication.

QUESTIONS.

[10581.]—**Sealing-wax on Drawing-Board.**—Would some kind reader inform me how to remove the sealing-wax, which I use instead of pins or paste, from my drawing-board?—WAX.

[10582.]—**Concrete Swimming-Bath.**—Will one of your numerous readers kindly inform me of a simple method for determining the thickness of concrete necessary to form the sides and bottom of a swimming-bath having a superficial area of about 1,500ft., and to be constructed in good soil?—OTTER.

[10583.]—**Sketching Tour in Yorks or Lincolnshire.**—Can anyone suggest, through your Intercommunication Column, an outline sketch of route for a week or ten days' sketching tour—Yorkshire or Lincolnshire preferred? Particulars of buildings will be acceptable.—J. B. M.

[10584.]—**Bicycle Sketching Tour.**—Would some one map out for me a sketching tour (riding a bicycle) from Northampton, viâ Oxford and Winchester, to Southampton and the Isle of Wight, with distances from place to place, and all architecturally interesting places? Also another route home.—H. NORMAN.

[10585.]—**Mortar.**—How can the composition of mortar, and the proportion and quality of lime therein, be readily estimated? How long after the lime is slaked and mixed will it retain its full strength?—BARROW.

[10586.]—**Damp Rot.**—About a year ago the ceiling of my wine-cellar fell in, and the joists supporting the hall tiles were found to be quite rotten. Between the old bearers, which were left in so as not to disturb the tiles, new ones were fixed and left unceiled. There is ventilation into the main cellar and over the door, but a white fungus, heavy with wet, is now rapidly spreading over all the timbers. Can any reader tell me how to stop this?—ANXIETY.

[10587.]—**Damp.**—Parts of an outside wall are so damp that the paper is quite spoiled. Can this be prevented by stripping off the plaster and using neat cement?—PORTLAND.

[10588.]—**Northamptonshire.**—I should be much obliged if any of your numerous readers would tell me a good sketching centre in Northamptonshire, and also the best guide-book for one wishing to study architecture.—YORKSHIREMAN.

[10589.]—**Haulage.**—What is fair proportion, or percentage, to take off cost of house of, say, £800 or £900 in value, for haulage of all materials? Distance from station to site two miles.—QUERIST.

[10590.]—**Triforium.**—Would some reader inform me the reason why the "Triforium" is so called? The word obviously means "three openings," but I cannot see the connection.—A READER.

CHIPS.

In the courtyard of Somerset House, Messrs. Peto Brothers, the builders, are erecting a drill hall for the volunteers.

The Glenholm hydropathic establishment at Rothesay, which was destroyed by fire on Friday night, was the first and the largest of its class in Scotland. The damage done is between £40,000 and £50,000.

A church is in course of erection at Garth, near Maesteg, Glamorgan, to accommodate about 200. Mr. W. Cox, of Llandaff, is the contractor. Messrs. Halliday and Anderson, of Cardiff and Llandaff, are the architects.

The building of the Warrington branch of the National Provincial Bank of England is now proceeding rapidly. The work is being carried out under the supervision of Messrs. Gribble, architects. The contractor is Mr. J. W. Beevers, of Warrington.

The work of restoring St. Mary's Church, Wolverhampton, which was commenced in 1887, has now been completed. The scheme comprised the erection of a new vestry and parish room, enlarging the infants' school, and improvements and alterations in the church, including the re-flooring and re-seating of the south transept, remodelling and changing the site of the pulpit, a new gas service, removing the north and south aisle galleries, re-fronting, flooring, and seating the transept and west galleries, and repairing the organ. The cost has been over £1,200.

At Monday's sale of the art collection formed by the late Mr. Cavendish-Bentinck, M.P., at Messrs. Christie's, a picture by G. B. Tiepolo—the Madonna before the Almighty, with angels, was purchased by Mr. Doyle for the Dublin National Gallery for 50 guineas.

LEGAL INTELLIGENCE.

THE RIGHT TO SINK A WELL ON ONE'S OWN LAND.—TENDRING HUNDRED WATERWORKS COMPANY V. FREE, RODWELL, AND COMPANY.—This case, heard last week in the Queen's Bench Division, before Mr. Justice Denman and Mr. Justice Wills, raised an important question—whether a person can be restrained from digging a well on his own land if the effect is to interfere with or pollute the water of his neighbour's well. The question had arisen under these circumstances. In 1886 the plaintiff water company sank an artesian well on land at Mistley, adjoining that of Messrs. Free and Company, maltsters and brewers, near the river Stour, in Essex. The land on which the Company's well was sunk had been acquired from Messrs. Free, under a contract by which the latter firm were to have a pure supply of 48,000gals. a day, and were not to sink any well between the railway and the road, which was near the river. Messrs. Free, however, had lately opened a well on the other side of the road between the road and the river, which at that point is tidal, and the water company objected to the new well as likely to let brackish water into the subterranean springs supplying their well. Hence they brought an action, in which they claimed damages for the wrongful drawing and abstraction from the plaintiff's mains by the defendants of large quantities of water of the plaintiffs in excess of those they were entitled to draw, and for an injunction to restrain the defendants. An application had been made on the part of the water company for an interim injunction; but the judge at chambers, Mr. Justice Henn Collins, refused the application, and so it came before the court by way of appeal. The court now refused to issue the interim injunction, the appeal being dismissed with costs.

A HOUSE THAT WAS NOT BUILT.—In the Lord Mayor's Court on the 29th ult., before Mr. Roxburgh, assistant judge, and a common jury, Mr. George Walter Stanham, architect, 100a, Queen Victoria-street, sued Mr. Bilton, a sub-inspector of schools, residing at Gunnersbury, to recover £40 for professional services rendered. In June of last year the defendant informed the plaintiff that he was desirous of building a house at Hazlemere; the plaintiff was instructed to act as architect. The defendant told the plaintiff that he did not wish to spend more than £500, and he expressed a desire to purchase his own stoves and mantelpieces. The plaintiff, in accordance with instructions, prepared the necessary plans; but the house was never built, owing, as the defendant said, to the plans produced by the plaintiff being such that the building could not be erected at all except at a cost which was more than double the limit which he had fixed. The claim was made up of £1 for travelling expenses, £1 7s. 6d. for stationary charges, £5 10s. commission, alleged to have been agreed by the defendant in respect of plans which were rendered useless by the defendant's alterations, £5 5s. for an original specification, and £27 12s., three per cent. on the lowest tender. The question left to the jury was whether or not the limit fixed by the defendant was £500. The jury found for the plaintiff for £25 4s. 3d.

DELAYING THE EXECUTION OF A CONTRACT.—HENRY V. DUNDALK GUARDIANS.—This case was heard in Dublin last week before Mr. Justice Gibson and a common jury. The action in the first instance was instituted by the Dundalk Board of Guardians against Mr. Henry, a contractor for the building of labourers' cottages, and his sureties, for the recovery of penalties for the non-completion of the contract within the time specified in the bond. The contractor filed a counterclaim amounting to £357 12s. for loss sustained by alleged breaches of contract, on the grounds that possession of some of the sites had not been provided by the guardians, and that variations had been made in the plans subsequent to acceptance of the tenders and the signing of bonds. Some time after proceedings were instituted the guardians discontinued the action brought by them, but Mr. Henry proceeded with his counterclaim, so that practically, when the case came on for hearing, Mr. Henry was in the position of plaintiff, and the guardians defendants. Mr. Henry deposed that in March, 1889, his tender for the building of twelve cottages was accepted by the guardians; there were four cottages in blocks of two each in the townland of Newtown, at £217 per block; two in one block at Tullydrum, at £217; four in two blocks at Grange, at £216; and two single cottages at Grange at £115 each; his tender was accepted on March 25, and he signed the bonds on April 2; the cottages were to be built in accordance with plans and specifications prepared by the engineer employed by the guardians, Mr. Cahill. The cottages were to have been completed by August 1, but great delay occurred, as he could not get possession of the sites, so that he lost owing to the increase of wages in the harvest time, and to the tradesmen and labourers working shorter hours in winter than in summer. The jury gave a verdict on all counts for the contractor. The jury found the guardians did not provide sites in Tullydrum or Grange, and assessed the contractor's loss in each case at £21 13s. For having materials prepared for the cottages in both townlands, they assessed his loss at £12 10s. in each. These several sums amounted to £68 6s., and a verdict for this amount was entered, and judgment given.

IN THE QUEEN'S BENCH.—JENNINGS V. NURSE.—This was an action brought by the well-known wooden letter maker at 263, High Holborn, to recover damages for injury to the light of his workshop in rear of his premises by the erection of a building by the defendant. Messrs. H. H. Bridgman, S. Goss, and E. A. Grüning were surveyors for the plaintiff, and Messrs. R. J. Worley, G. Edwards, and H. Lovegrove for the defendant. Verdict, damages £250 and costs.

THE TIVOLI CONTRACT.—At the Kent Assizes, in the Civil Division on Saturday, Messrs. Heighway Dupree, of Piccadilly, plainted an action against Messrs. Kirk and Randall, of Woolwich, for various sums in carrying out contracts for the defendants. Mr. Winch, Q.C., said that in 1888 the plaintiffs had contracts in respect of work at the Tivoli Music Hall, Strand, and the Café Monico, near Piccadilly Circus, and in carrying out their works disputes arose between the parties as to their respective rights. Plaintiffs commenced an action in the Queen's Bench, when an agreement was come to, and under this agreement the present action arose, the main question being as to whether the architect engaged by the Tivoli Company had power under the agreement to order the work to be done. Mr. Channell, Q.C., for the defence, contended that the architect had not the power, and he called Mr. Joseph Randall, whose evidence was to the effect that all authority to order the work which had been done was withdrawn from the architect, Mr. C. J. Phipps, and that the extras ordered by Mr. Phipps comprised structural alterations, which, even if authority had not previously been withdrawn, he had no power to order under the contract on which the plaintiffs relied, as that contract had reference to decorative work only. His Lordship (Sir J. C. Mathew) gave a verdict for the plaintiffs for their full claim, which involved some thousands of pounds. It was stated that the defendants had sustained a loss of £25,000 over the Tivoli contract.

ARCHITECT'S CHARGES.—At the Kent Assizes Mr. F. Rogers, architect, of Bromley, sued Mr. R. M. C. James, of Bedford-square, for £123, balance of his account for work done with respect to the erection of a house at Scott's Park, near Chislehurst, the defence to which was that the charges were not fair and reasonable, and the defendant counterclaimed for £870 for negligence in complying with the contract. The plaintiff got out plans of a house for defendant from instructions from defendant and his wife. The house was to cost about £2,000; but on the plaintiff working out the plans he found the cost would be about £2,500, and the result was he received instructions to prepare a more modest affair, which he did, and the work was done under the partial supervision of the plaintiff. In the original plans the wine-cellar was to be built 8ft. high, but owing to water coming in it could only be built 6ft. 3in. high. Plaintiff said all his charges were based upon the scale of the R.I.B.A. Cross-examined, the plaintiff admitted that he could not say whether the foundations were according to the contract. He had no reason to believe that concrete had been put in the foundation. The jury returned a verdict for the plaintiff for £58 on the original claim, and for £90 for the defendant on the counter claim.

At the Tiverton Baptist Chapel a memorial consisting of an engraved brass with surroundings of polished alabaster, has been erected during the past week. It has been erected by the Baptists of Tiverton to the memory of the late Alderman Lane, J.P. Mr. Harry Hems, of Exeter, has carried out the work.

At Tuesday's meeting of the London County Council, the Building Act Committee presented a report recommending that Mr. Ellis Marsland, M.S.A., who has been district surveyor for East Kensington since 1885, be appointed district surveyor for Camberwell, upon condition that he resign his present appointment, and that Mr. A. Crow, A.R.I.B.A., be appointed district surveyor for Whitechapel, Christ Church, Spitalfields, the hamlet of Mile-end New Town, and the Tower Liberty. The recommendations were adopted.

At a general meeting of the shareholders of the Llandudno Pier Company, held on Friday, it was unanimously resolved to build a new theatre. Plans and designs have been prepared by Mr. Daniel Arkell, architect, Birmingham, and the work is intended to be pushed forward, so as to have the theatre ready for next season. The site for the new building is the main entrance of the pier. The style chosen is an adaptation of Romanesque, with a Byzantine treatment of ornament. The elevation will be faced with red brick and stone dressings. The building will hold about two thousand persons.

PARLIAMENTARY NOTES.

THE CONTRACT FOR REPAIRS OF PUBLIC BUILDINGS.—Mr. Buxton asked the First Commissioner of Works, on Monday, whether Messrs. Holland and Hannen, contractors for repairs, &c., of public buildings, agreed under their contract to pay their painters employed under the contract at the *minimum* rate of 8½d. an hour, the ratio generally accepted as current in the trade for competent workmen; and whether he was aware that, in violation of their agreement, they had within the last few weeks reduced the wages of some, or all, of the painters engaged on the work to 7½d.; and, if so, what action he proposed to take in order that the resolution of the House of February 13, in regard to the payment of fair wages under Government contracts, should be properly enforced? Mr. Plunket: The question of the hon. member seems to be based upon a misconception. Messrs. Holland and Hannen are not departing from the terms of their contract. The facts are that in the schedule of rates accompanying their tender the *minimum* rate for painters was higher. But this was owing to an error, and when they discovered the error, Messrs. Holland and Hannen wrote to the Office of Works for permission to correct it, and to reduce the *minimum* rate for painters to 7½d. per hour. Having satisfied myself that for much painters' work 7½d. would represent the rate of wage "generally accepted as current for competent workmen," I agreed to the alteration, and the contract has been drawn on the basis of a range of wages for painters of from 7½d. to 9½d. per hour.

HANOVER CHAPEL.—In the House of Commons, a discussion took place on the Hanover Chapel Bill, which authorises the sale of the present chapel, the well-known edifice in Regent-street, designed by Professor C. R. Cockerell, and provides for the building in Davies-street, a poorer part of the parish, of a church and vicarage on a site worth £20,000, which had been given by the Duke of Westminster. Petitions against the Bill were presented by the Royal Academy and the Royal Institute of British Architects. On a division, the Bill was read a second time by a majority of 16, the numbers being 107 to 91.

WATER SUPPLY AND SANITARY MATTERS.

CAPETOWN.—In 1888 Mr. E. Pritchard, M.I.C.E., of Birmingham, was retained by the Municipality of Capetown to report upon the best means of sewering the district and disposing of the sewage, a number of competitive plans having proved unsatisfactory. Mr. Pritchard recommended a sewerage scheme with a large carrier for conveying the sewage to a point in Table Bay, where it could be discharged into the sea. There was some hesitation in the matter of cost, and ultimately nothing was done. An appeal was then made to the Government, who appointed Mr. Clement Dunscombe to investigate the subject. That gentleman has made a report, which has been presented as a Parliamentary paper. The recommendations it contains are practically identical with the scheme proposed by Mr. Pritchard.

A German engineer has devised a new method for fixing a foundation under water. By means of a powerful blast of compressed air he drives powdered cement down into the sand or mud at the bottom of a stream. The action of the water immediately fixes the cement, and it becomes like solid rock.

On Saturday the memorial stone was laid of a Congregational church and Sunday school in the district of Horton, Bradford. The new premises are nearly ready for the roof. They stand at the junction of All Saints'-road and Horton-road. The contracts for the new church and Sunday school amount to £3,880. The design sent in by Mr. T. C. Hope was chosen in competition for the structure. The building will be of the Queen Anne type and octagonal on plan. The contractors for the work are Mr. George Day, mason; Messrs. M. and D. Thompson, joiners; Mr. S. Sunderland, plasterer; Messrs. Hill and Nelson, slaters; and Mr. J. H. Lawson, painter.

Mr. James Taylor, a well-known railway contractor, died at his residence, Westward Ho! on Monday, aged 75 years. Amongst the most important work carried out by him was the construction of the London and South-Western line from Bideford and Torrington and the Ilfracombe line, the line from Yeovil to Exeter, Aldershot railways and many other important lines. He built the Grimsby Docks and Grimsby Fish Dock, opened by Prince Albert Victor. In these undertakings he was assisted by his son, Mr. George J. Taylor, to whom he made a gift of the bulk of his property some time ago. He leaves four sons and three daughters. He had purchased Castle Cary, Torquay, with the intention of residing there. The funeral will take place to-day (Friday) at his North-country seat, Springfield Hall, Whitmore, Staffordshire.

STATUES, MEMORIALS, &c.

BURNS STATUE AT AYR.—Sir Archibald Campbell, of Blythswood, M.P., Master Mason of Scotland, unveiled at Ayr, on Friday, a statue to Robert Burns. The scheme originated with the Ayr Burns Club in 1886. In 1889, the first prize for a model of the statue was awarded to Mr. George A. Lawson, H.R.S.A., a native of Edinburgh, who has carried out the work. The pedestal is of grey Kemney granite. It stands 12ft. high, and weighs 25 tons, the height of the statue and base being rather over 21ft., the weight of the two being about 26½ tons. The statue is to be railed off, the inclosure being a triangular plot, which is to be planted with evergreens. The railing is to be presented by Sir William Arrol. The statue stands between the South-Western Railway Station and the main entrance to Ayr, known as Fauldbacks. The pedestal is constructed to admit of four bas-reliefs, in which it is intended to insert renderings from the poems of Burns—"Tam O' Shanter," "The Jolly Beggars," "The Cottar's Saturday Night," and "The Vision." The statue represents the poet standing erect, with his arms crossed, as if he was receiving an address; and the costume is that of the period. The head is modelled on the Skirving portrait of the bard.

CHIPS.

It is proposed to erect a University College and Technical Schools in Newport-road and Westgrove, Cardiff, at an estimated cost of £30,000.

The foundation stone was laid on Friday of new workhouse buildings for the Grantham Union. It had become necessary to provide fresh premises, as the Great Northern Railway Company required the land upon which the old workhouse stands at Grantham, and which adjoins the railway station. The new site comprises 6½ acres, and with the buildings, when completed, will cost £25,000. The contractors for the buildings are Messrs. Hodson and Son, of Nottingham. Mr. V. Green, of Grantham, is the architect. The buildings are to be in the pavilion style.

Plymouth Conservative Working Men's Union have made arrangements for the erection of club-rooms and offices adjoining the Conservative Club premises in Princess-square, and the work is to be commenced immediately. Mr. Chas. King is the architect, and Messrs. A. R. Lethbridge and Son the contractors.

A new hospital at Montrose Asylum, built at a cost of £18,000, from designs by Mr. Sydney Mitchell, of Edinburgh, was opened last week.

A new Foresters' Hall at Pontrilas was formally opened on Friday. Mr. Godsall, of Hereford, was the architect, and Mr. Taylor, of the same city, the builder.

A new Jubilee clock on the Congregation Church in Tontine-street, Folkestone, was inaugurated last week. Messrs. Gillett and Johnson, of Croydon, were the makers.

A new Wesleyan Chapel at Friendley, near Halifax, Yorks, was opened last week. It has cost £2,800, and the chief contracts, those for masonry and bricklaying, were carried out by Mr. John Turner, of Warley, Halifax.

A patients' private home at Woodside, Plymouth, was opened last week. The premises have been altered for their present purposes from plans by Mr. Charles King, of Plymouth, and the contractors were Messrs. A. R. Lethbridge and Son, of the same town.

At the last meeting of the London School Board, it was decided that the salaries of Mr. H. Perry, the assistant architect for building, and Mr. Bradfield, the assistant architect for repairs, the two officials who have been engaged in reporting on the defects in schools, should be raised from £325 to £400 each.

The local board of health of Alnwick have adopted plans by their surveyor, Mr. Geoffrey Wilson for the sewerage of the district. The scheme will cost £2,500, and towards this the Duke of Northumberland has offered to give £1,000.

The new schools, Warrington, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

In accordance with powers obtained by the Great Northern Railway Company in their Bill of 1889, the through line near Leeds from the west end of Bramley station to Wortley West Junction is about to be widened. This will involve a large amount of work, including the remodelling of Bramley and Armley stations, and the widening of several bridges so as to allow of four sets of rails. The tunnel under Tong-road will also have to be doubled. The plans for the widening have been prepared by the Company's resident engineer, Mr. H. W. Sadler, under the direction of Mr. R. Johnson, of King's Cross.

Our Office Table.

A SERIES of important recommendations, involving an estimated expenditure of two millions sterling, has been made by the Improvements Committee of the London County Council for the construction of new streets and the widening of existing new thoroughfares. The chief proposition is a revival of the scheme for a first-class arterial communication from Holborn to the Strand. A second and only less important proposal is also a resurrection—*i.e.*, the demolition of the island between Holywell-street and the Strand, bounded at either end by the churches of St. Clement Danes and St. Mary-le-Strand. Should this scheme be adopted, the north side of Holywell-street will be the new frontage of the Strand; and to the north of both churches the street will make a crescent-shaped curve, the shops fronting St. Mary-le-Strand being set back some 20ft. or 30ft. The objectionable "betterment" proposal, which met with well-merited ridicule and opposition last year, is revived, in less offensive forms, under the title of an "improvement rate," which is not to actually exceed the increased annual value of the property benefited. The other projects include the widening of the south-west angle of Tottenham-Court-road, by the removal of an island between that thoroughfare and Bozier's court; the widening of Nine Elms-road, Battersea Park-road, York-road, Battersea; Wandsworth-road, all in the district between Vauxhall and Clapham Junction; Sandys-row, Whitechapel, and, lastly, and not least, a new street 80ft. wide from Tooley-street to Bermondsey New-road, with a widening of the latter thoroughfare at the Old Kent-road end, so as to accommodate the anticipated traffic from the new Tower Bridge.

THE Annual Report of the London County Council for the year ended March 31st is full of questions of topical interest. The several reports of the Standing Committees include the subject of the Blackwall tunnel, and the recommendation of the committee that the engineer prepare drawings and specifications for a tunnel 27ft. extreme diameter and not less than 23ft. internal diameter for vehicular and pedestrian traffic, and that tenders be invited. The plans are being prepared under the direction of Mr. Binnie. The Building Acts Amendment is a question of interest to which we shall refer in detail. Other reports appear on highways, the Housing of the Working Classes, to which we refer this week, various street improvements, main drainage, industrial schools, parks and open spaces, theatres, and music halls.

MR. ALFRED WATERHOUSE, R.A., is adding two floors in Northumberland-avenue to Mr. John Gibson's building belonging to the Society for the Promotion of Christian Knowledge. This block was the first erected in that thoroughfare, and when built looked imposing and effective. Its prodigious neighbours, subsequently projected during the hotel mania, entirely dwarfed the building, rendering it comparatively insignificant, while its refined Classic detail is no doubt overpowered by Métropole vulgarity. Its architect declined the task of enlarging his work, and the problem has been undertaken by the Past-President of the Institute, who is thus increasing the accommodation rendered necessary by the enlarged business of the S.P.C.K., thereby bringing the building up to date, if not to the height of the adjoining colossi.

AN important scheme of dock and harbour extension and improvements received the final approval of the Leith Dock Commission on Friday. The necessity of a considerable increase to the dock accommodation of the port in the near future has for several years occupied the attention of the Commissioners, and the plans have been prepared by Mr. Peter Whyte, M.I.C.E., the superintendent of the harbour and docks. The scheme now submitted is to construct a sea wall to reclaim an area of 54 acres, and to construct thereon a deep-water dock, about 1,000ft. long and 375ft. wide, with an entrance from the harbour 66ft. wide, and having the sill laid 13ft. below low-water of spring tides, which would give a depth on the sill of about 30ft. at high-water spring tides, and about 26ft. at high-water neaps. A passage to the Albert Dock would be formed which would increase the facilities for handling deep-draught vessels in the

Albert and Edinburgh Docks, and thereby add to their efficiency and safety. The area of the proposed dock is nearly nine acres, and the available length of berthage about 2,500ft. The quays will be about 350ft. wide, which will be sufficient for the erection of wide sheds and the necessary rails, roads, and space for dealing with large cargoes. A site is shown at the north-west corner of the dock whereon a large dry dock could be constructed. The cost of the proposed dock is estimated, with the sea wall, and allowing for filling, sheds, rails, &c., at £275,000, and the deepening of the channel at £50,000—a total of £325,000; exclusive of the dry dock, which would cost £40,000.

IN his annual report to the corporation of West Hartlepool, Mr. J. W. Brown, the borough surveyor, says that during the past year his department have erected in various parts of the borough many upcast sewer ventilators. "The positions sought are," Mr. Brown says, "those adjoining high gables and where there are in existence corresponding downcast gratings at the street level. This system has been doubted by many, nevertheless it is working very satisfactorily, as in all cases where we erect a pipe we find a strong current of air coming from the sewer, and the smells previously complained of at the street level cease."

THE collection of antiquities at the Nottingham Art Museum, discovered during excavations undertaken by Lord Savile on the north shore of Lake Nemi, was opened on Wednesday by the Mayor of Nottingham, Mr. S. H. Sands. The collection consists of votive offerings in terracotta, personal ornaments, domestic and sacrificial utensils, architectural details, and decorations, sculptures, inscriptions, and coins, all from the site of the temple of Diana Nemovensis (the Artemisium described by Strabo), discovered by Lord Savile in 1885-86. The extensive series of objects bears almost entirely upon the worship of Diana at Nemi, and proves, moreover, that the offices of the temple were presided over for the most part by priestesses. Mr. G. H. Wallis, the director of the museum, has classified, arranged, and described the objects, and has compiled a catalogue with notes.

A NEW apostle of sanitation has arisen. Mr. Latham Anderson proposes to abolish the generally-approved system of house-drainage, and to adopt in lieu thereof a "single trap system," the object of which is to keep the interior surfaces of house-pipes as dry as possible, so as to prevent the formation of what he terms "germ-breeding slime." A constant current of dry air through the pipes is the object of this system. But does not the damp slime rather assist to keep dangerous organisms in a harmless condition—that is, to keep them in a position where they cannot be so active for mischief? We should rather think that the drying of the slime will give them freedom by allowing them or the spores to fill the air and to produce disease. We certainly agree with one authority in thinking that by the process of drying bacteria assume a more potent influence for mischief, as they are disseminated through the air. To kill or destroy the germs a considerable degree of heat would be necessary by the plan proposed, which, as far as we can understand, would be more productive of the evil it is sought to remedy.

CONSIDERABLE surprise and speculation have been occasioned during the past fortnight in Birkenhead by the disappearance of Mr. John Davison, a well-known builder and contractor in the town, and a member of the town council. It is believed he was last seen at a bank in Hamilton-square, on Saturday week, when he drew a large sum of money for the purpose, it was supposed, of paying the week's wages of the men in his employ. As he did not return to his office at Oxton, the men were compelled to do without their wages until Monday, when they were paid by Mr. Davison's cashier. In addition to the money which he drew on the occasion referred to, Mr. Davison is believed to have in his possession a considerable sum which he had received in the ordinary course of business from several other firms. A meeting of those associated with him in business affairs was held in the latter part of last week, and it was decided to carry on the business until the contracts in hand were finished. An interim order on a creditors' petition has been applied for, and unless Mr. Davison puts in an appearance within twelve days from the date of the interim order, a receiving order for the administration of his affairs will follow in due course.

THE American Census officials have just made a special report on the statistics of lumber manufacturing and timber products in the United States, which is of general interest. Unfortunately the Federal Government does not possess even approximate estimates of the area of timber-lands owned by it in Michigan, Wisconsin, and Minnesota, so that it is impracticable to make a calculation as to the period which will elapse before the standing timber in these States will, at the present rate of consumption, be exhausted. The amount of timber territory and standing timber owned by individual manufacturers is accurately ascertained, and it is shown that this supply will be exhausted, at the present rate, in five years. When this is gone, the only reserve in these States, which furnish nearly all the pine lumber used in the country, is to be found in the public lands owned by the State and Federal governments. As to the Federal timber lands, there are no statistics whatever. Of State lands there are tolerably accurate statistics. Minnesota, which is the only State which owns any considerable quantity of pine land, is said to hold thirteen million acres, containing twenty thousand million feet of standing timber, or enough to supply the saw-mills of the State, at their present rate of consumption, for about eighteen years. In Michigan, the amount of timber on land owned by the State is so small as not to be worth considering; and in Wisconsin there is only enough standing timber on State land to supply the local mills for about three months. Contrary to the ordinary impression, the loss by fires in the pine forests is not very considerable, the average annual loss being only less than 5 per cent. of the usual quantity cut; but the conflagrations cause great destruction in the hard-wood growth which succeeds the pine, and which has now become an important part of the timber resources of the three States in question.

AN important development of the sandstone quarries of the United States is recorded. The "bluestone" quarries of the States of New York, New Jersey, and Pennsylvania produce very large quantities. In 1889 it is said that nearly four-fifths of all the bluestone produced came from 24 counties of New York, and one-fifth from 10 counties in Pennsylvania, the New Jersey product, which was all found in the counties of Hunterton, Merer, and Sussex, amounting to less than 16,000 tons. The total value of the New York sandstone quarries, including bluestone, in 1889 amounted to 1,986,894 dollars. It appears that the States rank as follows in the product of sandstone other than bluestone: Ohio, Pennsylvania, Colorado, Connecticut, and New York. The above States contributed in value upwards of 7½ million dollars of sandstone, chiefly used in building. Bluestone is an extremely hard and durable stone, and is on this account largely used for flagging, sidewalks, curbing, &c.

WOOD pavements in Berlin have not given unqualified satisfaction. We do not know why; unless it is that the system of laying or that the particular wood used is at fault. Beech-wood has been largely employed, because it was thought that by these means the productiveness of the beech forests of Germany would be increased; but it has been found that beech-wood could not stand the test. Only on sharp inclines is hard wood used to give a foothold, the other portions being of asphalte. This practice has a lesson for us, who have all along used the same material — asphalte or wood — for both steep gradients as well as the level parts of roadways. The Berliners have sensibly adopted a rougher material for the steeper parts, and thereby lessen the cruelty to horses and save expense. A kind of ribbed or corrugated material might be put down on all inclines such as that of Ludgate-hill.

IN a letter to the *Railroad Gazette*, Mr. Charles J. Bates, of New York, describes the novel foundation of an old building standing on made ground between Washington and West-streets, on Murray, which has been recently demolished. The designer first covered the entire lot with two courses of timber, each 6in. thick, laid at right angles; over this was a bed of concrete about 6in. thick, then a layer of flat stones 2in. thick, then a course of brick set on edge, then another bed of flat stones 2in. or 3in. thick, then a course of brick laid flatways. The brick and stone were all laid in cement mortar, and the whole plastered over with a thin bed of mortar. The designer apparently intended that his building should float on the soft ground.

MESSRS. HAYWARD TYLER AND CO.'s new "C" catalogue of Pumps and Pumping Machinery is much more than a trade list. It is a really useful compendium of information respecting the specialities which have made this firm famous all over the world as manufacturers of pumps, well-frames, pumping machinery, steam fittings, and engineers' sundries. There is not a necessity for which it does not provide, and the tabular information is so well compiled, and so completely are the various appliances illustrated, that the task of selection is easy. The moderate prices throughout are also worthy of remark, especially when the world-wide reputation of the firm for good work is remembered.

THE vastness of Maine's timber wealth is not generally appreciated. Every year now 500,000,000ft. of logs are cut in the State, about one-third of this amount floating down the Penobscot; and the quantity of manufactured lumber that has been shipped from the State since the first saw-mill was started is enormous beyond description. To-day the Penobscot log crop is sawed almost wholly for the American market, New York, New England ports, and Philadelphia taking the bulk of it. An occasional cargo of "shippers," as a certain quality of pine boards are called, is sent to the Windward West India Islands, but all the other long timber is sold in the States markets. Improved machinery enables the manufacturers to get more and different dimensions of lumber out of a log than formerly, and in recent years a great variety of short lumber has appeared in the market.

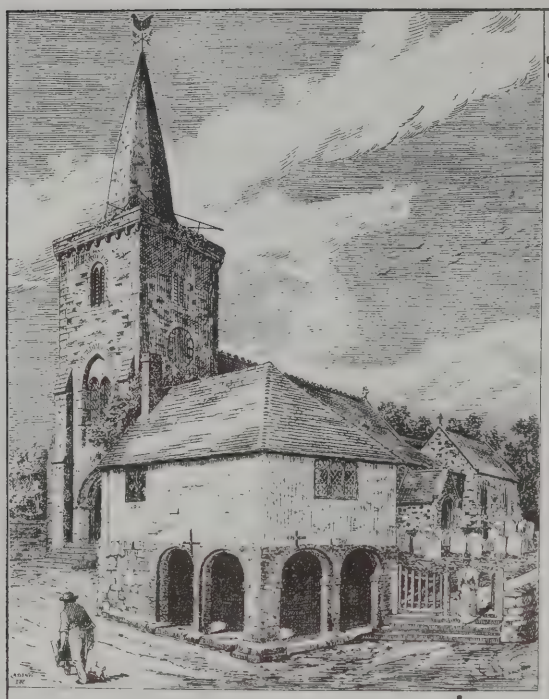
CHIPS.

New auction rooms and stores were opened in Hertford-street, Hereford, last week. Messrs. G. and I. Stearne were the architects, and Mr. J. Worwood was the builder.

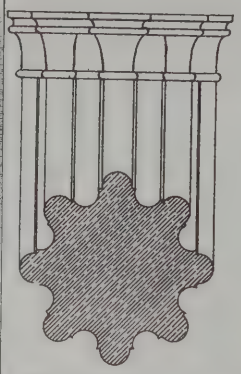
Mr. Goodwin S. Packer has been the architect for the new Wycliffe Hall, just opened at Southport. The size of the room is 51ft. by 33ft. by 20ft. to ceiling, which is a flat one, and ceiled with pitch pine boards.

At St. James's Church, Marylebone, on Sunday, the Rev. H. R. Haweis unveiled an east memorial window, which was designed by Mr. E. Burne-Jones, A.R.A., and executed by Mr. William Morris. The chief subject is the Good Shepherd, and the side lights are occupied by angels.

A block of steam flour mills is about to be erected at Weymouth at a cost of about £3,000. Messrs. Brown Brothers, of that town, are the contractors.

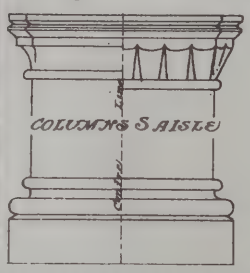


The parish church of Llangynwyd, Glamorgan, which has fallen into a very dilapidated condition, is now undergoing a complete restoration, including new nave and chancel ceiling in oak, oak seating and flooring. The peal of six bells are being rehung and tuned. Mr. W. Charke, of Llandaff, is acting as contractor. Messrs. Halliday and Anderson, of Cardiff and Llandaff, are the architects.



The local district council in connection with the National Registration of Plumbers held an examination at the Merchant Venturers' School, Bristol, last week, when the candidates attended from Bristol, Bath, and various parts of Gloucestershire and Wilts, and were examined in the theory and practice of the trade. Sixty per cent. of the candidates succeeded in passing the full examination qualifying for registration.

A public park, upwards of 30 acres in extent, was presented to the inhabitants of Consett and Blackhill, Durham, on Saturday, by the Consett Iron Company, in whose various works about 20,000 men are employed. The land was little better than a waste 18 months ago; now it is intersected by walks and planted with trees and shrubs suitable to its high altitude and exposed situation. Mr. C. P. Douglas, the engineer to the company, laid out the grounds, and Mr. Duncan Smith was the landscape gardener.



A new Wesleyan chapel at Westbury Park, Bristol, was opened on Friday. It is Early Decorated in style, and is built of Pennant stone, with Combe Down dressings. Mr. T. R. Lewis is the contractor, and the outlay has been £3,200. Messrs. Davey and Bushell, St. Michael's Park, Bristol, executed the carving, and Mr. H. Dare Bryan, of College Green, in the same city, was the architect.

The Cross Flats Park at Beeston Hill, Leeds, was opened on Saturday. It contains 41 acres of land, was purchased for £12,000, and is being laid out from designs by Mr. Beilby, consulting gardener to the Leeds corporation.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1907.
FRIDAY, JULY 24, 1891.

THE LONDON COUNTY COUNCIL.—REVISION OF THE BUILDING ACTS.

THE Annual Report of the London County Council, for the year ending the 31st of March, contains many important matters of interest to the architect and building community, the leading subject being the report of the Building Act Committee on the subject of the revision and consolidation of the Building Acts. But there are a variety of other topics of general interest which form reports of the standing committees of the Council. Sir John Lubbock's address, lately delivered, reviews in a summarised manner the work of the Council, and forms a useful introduction to the report. He glances at the complaint of the alleged increase of the rates, the true increase of which is put down at a halfpenny. This moderate increase is justified if we take into consideration the large expenditure incurred at Barking and Crossness, the addition to parks and open spaces, and increase of fire brigade. At least, it is perhaps some satisfaction to the overtaxed ratepayer to be assured that while in Birmingham the annual expenditure per head of population is £2 16s. 5d., and in Manchester as much as £3 4s. 7d., the expenditure per head in London is only £2 7s. 9d. If we take foreign cities, we find the rate per head much higher, Paris, for instance, being as much as £5 4s. 7d., so that London compares favourably with other English and Continental and American cities. Several Bills have passed through the House of Commons this year—namely, the General Powers Bill, the Overhead Wires Bill, the Sky-Signs Bill; but the work which most concerns us is that of the Building Act Committee. Some idea of the enormous amount of business done by this committee may be gathered by the account which the Chairman of the Council gives. Every week numerous recommendations are made under various Acts of Parliament upon which the Council has to decide. Many hundreds of plans are considered every year, and the returns of the district surveyors amount to often 20,000 in a month. These duties are in addition to the supervision of streets, lines of frontage, naming of streets, dangerous structures, &c. The clauses framed in the London Council General Powers Bill are of general importance and application, though opposed on behalf of the railway and other companies, and by large estate owners.

We will refer *seriatim* to them. Under section 27, provision is made for plans and particulars of buildings being signed by the Chairman of the Building Act Committee or by some other person appointed for that purpose by the Council. Previously to the new Act, every plan had to be signed by the Chairman of the County Council, thus causing unnecessary delay in the transaction of business and the commencement of building operations. Again, by section 28 of the Metropolis Management Amendment Act, 1862, the superintending architect is empowered to determine the general line of buildings in any street in the county, and it had been decided by the House of Lords that there was no appeal from his decision. Under the new Act, any person dissatisfied with the architect's decision in regard to the general line can appeal to a tribunal to be constituted as follows: One member to be appointed by the Council, one member by the council of the Institute of British Architects, and one member by the council of the Surveyors' Institution. We have expressed our opinion on this point on a former occasion. With a clearly-defined rule or by-law, there ought to be no difficulty in the architect of the County Council coming to a satisfactory decision. One danger of allowing an appeal in such a case is that of increasing the number of appellants, and of setting up precedents of a dangerous character. As the decisions in the past have been made on very arbitrary and contradictory principles, however, a properly composed tribunal may be a necessity. But we are strongly of opinion that the Act in this matter should be as rigidly adhered to as possible, so as to prevent any unnecessary relaxation of a rule so desirable to the public. Hitherto, decisions have too often favoured the builder who desires to advance his frontage line. The next section, 29, has been enlarged in its powers. Under the old rule, buildings to be used as warehouses, or for manufacturing purposes, were limited in capacity to 216,000c.ft. without party-walls. Now authority is given to the Council to permit in certain cases, subject to special safeguards against fire, buildings not exceeding 450,000c.ft. without division by party-walls. This extension seems a much larger one than desirable, and the greatest caution ought to be exercised by the authorities in using their discretion.

A very important section (30), which prescribes that every building is to be placed 20ft. from "the centre of the roadway," has been rendered more explicit. Anomalies arose owing to a want of a definition of "centre of roadway," which if complied with on one side was likely to be misconstrued by the builders on the opposite side. For example, if the road was 30ft. wide, the buildings on one side had to be set back 5ft., so as to be 20ft. from the centre, thus making the boundary on one side 20ft., and on the other side 15ft., from the old centre line. The actual centre of road would then be shifted 17½ft. from the boundary on each side, instead of 15ft., as formerly. The owner of land opposite could therefore comply with the law by widening the roadway to an extent of 2½ft. only instead of 5ft., and thus it was unfair to the owner who had first built, and failed to give effect to the Act, which provided that the streets should be at least 40ft. wide. The new section will enable the Council to fix the "centre of roadway" once for all, which will prevent the existing irregularities. Buildings or forecourt boundaries on both sides will thus be made to set back the full 20ft. from the centre.

Section 31 gives increased power to the Council to make by-laws as to (1) the description and qualities of substances used in plastering; (2) the mode in which, and the materials with which any excavation made within 3ft. from the building shall be filled up; and (3) the duties of district surveyors in relation to such plastering or excavation, and their fees in connection therewith. These by-laws we gave in substance some time ago. Section 32 requires the erection of proper hoardings, fences, and platforms before any building within 10ft. of a thoroughfare can be built or taken down.

The next section, 33, deals with a question of great moment—namely, the frontage lines of a building at the corner of two streets. We have often been surprised to find a new corner building in advance of the original line of houses in side streets. The new section enables the Council to control both the main and side frontage of buildings in new streets. The report of the committee says: "This section was considerably weakened by the action of the Royal Institute of British Architects." The restrictions to the exercise of this power have, unfortunately, been favoured by many in the profession. We can imagine a corner building considerably curtailed and robbed of architectural features by observance of the rule here enacted, in which case some discretionary power might be usefully exercised; but these instances are few.

To remove doubt as to the illegality of extending any building so that any part of the external wall of such extension shall come within 20ft. of the centre of a public carriageway, a clause has been introduced in section 34. The next section will prevent streets being laid out not available for through vehicular traffic without consent. Section 36 is one of the most important of the new enactments. No limitation as to height at present exists; but this section, though opposed by some large estate owners, and, strangely enough, by the Institute of British Architects, restricts the height by giving the Council power to prevent the erection of buildings to an excessive height. We cannot understand upon what art or sanitary principle the Institute opposed this very desirable enactment, unless on that of putting as much value as possible on a given plot of land, and so increasing percentage commission on cost. Let us hope not. These are the main sections. Of course Crown and Government buildings are exempt from the Act.

Reverting to section 31, it may be noticed that the by-laws we have previously referred to have been slightly amended. For example, under the description of substances of walls, one important emendation as to walls is made, and reads as follows: "Every wall of a house or building shall have a damp-course composed of materials impervious to moisture, to be approved by the district surveyor, extending throughout its whole thickness, at the level of not less than 6in. below the level of the lowest floor. Every external wall or inclosing wall of habitable rooms or their appurtenances or cellars which abuts against the earth shall be protected by materials impervious to moisture to the satisfaction of the district surveyor." The latter provision is one of the most valuable rules of the by-laws, and will do more to render houses healthy and habitable than any amount of plumber's fittings. Asphalte linings to outer walls of basements will soon become the recognised mode of basement construction. The other revisions are in the direction of permitting any materials of a suitable character, and of giving optional power to the district surveyor to sanction them. These by-laws are now under the Home Secretary's consideration. The regulations approved regarding new appointments of district surveyors include two very important conditions—that a candidate must be 28 years old, and be under 50 years of age; that he will give his whole time to the duties, and not carry on business as an architect, surveyor, or builder, or directly or indirectly as a partner. The formation of streets, lines of frontage, special buildings are subjects of this report. It is ominous of the need of restrictions that as many as 365 applications were made to the Council during the last year for the erection of buildings beyond the general line, and that 184 were granted. In these matters, and those for permission to erect bay windows, balconies, porticoes, and external woodwork, the committee have to use much discretion in consulting both public convenience and safety, and architectural character. Of dangerous structures 2,656 cases have been reported; of underground cellars used as buildings 809 cases are mentioned.

The report of the Committee on Corporate Property and Charities is of considerable length, and we have no space here to discuss it. Next follows the report of the Fire Brigade Committee, which deals with the augmentation of the staff required. Highways, electric lighting Acts, tramways, bars and gates, Victoria Embankment, overhead

wires, &c., are matters dealt with. The Housing of the Working Classes Committee forms another report of interest, to which we have referred briefly. The Improvements Committee report on various improvements for which powers are being sought, as the construction of four bridges and approaches at the Isle of Dogs, the widening of Fortess-road, Kentish Town; the formation of a new street from Evelyn-street to Creek-road, Deptford; the widening of Fulham Palace-road and Queen-street, Hammersmith; the widening of St. George's place, Knightsbridge. These are insignificant works compared with others, such as the formation of a new street from the Strand to Holborn, and the widening of important arteries. As the Council suggest, it is a duty to provide reasonable facilities for the ever-increasing traffic. Neglect in these matters entails a pecuniary loss to the community. The tabular statements of recommended improvements are of interest, and we refer the reader to the report. The Main Drainage question is one of importance. Sir Benjamin Baker and Mr. A. R. Binnie, the chief engineer of the Council, have sent a report which deals with the method of treating sewage adopted, and they draw the conclusion that the most urgent requirements are the prevention of floods due to rainfall, and the cessation of the discharge of crude sewage into the river during periods of small rainfall, and during the first portions of heavier falls. The suggested works comprise new outfall and intercepting sewers on the north side at Old Ford, and a new low-level sewer and branches from Deptford to Crossness, and a new high-level sewer from Dulwich to Crossness on the south side, making a total cost for both sides of £2,220,000. A new outfall is suggested at a point near Shell Haven, in Sea Reach, or the alternative of discharging the whole dry-weather sewage into the sea. But of these proposals we cannot now speak. The condition of the Thames, the complaints of floodings, precipitation, and deodorisation of sewage are topics discussed. The committee recommend the suggestion of the engineers' report as to the works necessary on the north and south side of the river. The Parks and Open Spaces Committee have been doing equally important but more elevating work. Brockwell Park has been acquired and opened informally, the Council contributing £61,000, half the cost of the purchase. We are glad that the committee do not contemplate making it a gentleman's garden, but intend to leave it in its present park-like state as much as possible. Dulwich Park has cost £36,000 to lay out, its area being only 72 acres; the process has spoiled the park and benefited the gardeners at the cost of the public, who have lost the rural beauty and freedom of an open space. Other places acquired during the year are a portion of Parliament Hill, Victoria Park Cemetery, Telegraph Hill, Hatcham; Peckham Rye (extension), Bostall Woods, besides several disused burial-grounds and churchyards. Attention has also been directed to various spaces which it would be desirable to acquire, some of them adjoining commons. The work of laying out has been considerable, and has entailed expense, and in this direction it is easy to do too much. The arrangements for games and pastimes, like cricket, skating, golf, lawn tennis, have added to the duties of the committee. The Strand Improvements Bill we have already described; other Bills have been promoted of considerable public importance, to which we cannot here allude. Reports of the Sanitary and Special Purposes, of the Theatres and Music Halls, of the Contracts, and other committees are of interest. The special committee on contracts report that, after hearing representatives of various trades, they thought the clause relating to sub-letting in the Council's contracts was stringent enough to protect the workmen employed, the wages and hours of labour being those accepted as fair in the trade. Sub-contracting was unavoidable in some instances, and the committee suggested, in order to meet such cases, the following words should be added to the clause:—"But the Council retains power to allow the contractor to sub-let such special portions of the work as would not be produced or carried out by him in the ordinary course of his business." The Council also agreed that "all work of a continuous nature which does not involve a large outlay for plant, &c., such as the cleansing and watching of bridges, embankments, &c., under the control of the Council, be executed as far as possible by men directly employed by the Council, without the intervention of a contractor." This recommendation concedes largely the request made by trades' representatives that the Council should do its own work without the employment of a contractor—a principle that cannot fail to give general satisfaction.

PUBLIC LIBRARY OF ST. GEORGE, HANOVER-SQUARE.

THE competition designs received for the public library for the parish of St. George, Hanover-square, which were on view last week at the Vestry Hall, Pimlico-road, are on the whole very creditable to their authors, who have carefully studied the conditions. The site which forms a parallelogram between Buckingham Palace-road and Eccleston-place, with frontages to each of these thoroughfares, is a plot about 120ft. deep by 80ft. wide, and necessitated some consideration in planning the departments. One of the requirements was a museum on the first floor, and there were to be rooms provided for the librarian in the upper story. These conditions made it necessary to consider the question of lighting, and to make as much use as possible of both side and top lights. The design, "Utility" (by Mr. A. J. Bolton), selected by the committee is compact, and the entire area has been utilised. From Buckingham Palace-road, a central entrance gives access to a long news-room of 2,000sq.ft. on the right-hand side, lighted in front, and also by a skylight in the rear. On the left is a ladies' reading-room of 414sq.ft., beyond which is the main staircase to museum from the hall. Fronting the latter is the librarian's office, with glazed bay, having a full view of the entrance, and also the doors to lending library, of 2,000sq.ft., which occupies the remainder of the left side, having windows facing Eccleston-place and top-lighted. The reference library is on the other side, behind news-room, and top lighted, and has 1,400sq.ft. Between these rooms the author has a passage to Eccleston-place with an entrance porch, which he suggests as an early workmen's room. One good feature is the central position of the librarian's office, which commands all three of the rooms besides the entrance. But the turning into the borrower's lobby of lending library is awkward, and the ingress and egress objectionable as it is shown. The roof over lending library has circular iron ribs, with side roof lights. The reference library has two tiers of bookcases and gallery, and is lighted by a domical lantern; it has a circular stair lift and counter near librarian's office. On the first floor, fronting Buckingham Palace-road, is the museum, of rather square proportions, partly over news-room. On the second floor is the librarian's rooms, and in the basement are early morning rooms, stores, and heating apparatus. The principal front elevation, in a Renaissance style, is somewhat elaborate, and we prefer the plainer treatment. Towards Eccleston-place is a low, one-story elevation.

In its utilisation of the whole area of site, the design with motto "Lintol" has a somewhat similar plan. The news-room, 54ft. by 37ft., is placed with its end to the main road, on the right-hand side of entrance partly lighted by front windows, and partly by a skylight in the rear of the superimposed museum. Behind the news-room is the lending library, 47ft. 6in. by 43ft., with lobby on two sides for borrowers, lighted from Eccleston-place and also by an octangular lantern. On the left of entrance corridor is the ladies' room in front; then follow the staircase, an area for light, and next to it the librarian's office, with counter projecting into the reference library behind. The latter is 46ft. by 33ft. 3in., and has a glazed lantern over, besides windows to Eccleston-place. The librarian can overlook reference library and hall. The lobby for borrowers is divided by a rail, so that they can go in to receive or return books and pass out without jostling against those entering. We do not like the high octagonal roof and treatment of lending library. The museum is made a feature above, and has a coved timber roof. The elevation is in a sort of Early Renaissance, and Gothic in feeling. Next we come to a design worked out with much skill and taste under the motto, "St. George" (by Mr. I'Anson); the front elevation is in a Renaissance style, with three large arched windows to lending library, which in this plan is placed in front to the left of a side entrance hall. The advantage of this position is obvious, inasmuch as the borrowers can pass into the lobby directly they enter, and leave without the inconvenience of having to pass through the building or by other rooms. The lending library has an area of 2,000sq.ft., and is lighted by three front windows, and also by a skylight which runs along the inner side of room beyond the wall of museum over. The reference library behind, of 1,000sq.ft., has a light area on the left side, and adjoining it on the right are the librarian's and assistants' rooms, access to which is obtained by a side corridor in a line with entrance hall. This corridor is also lighted with a side area, and gives access also to the news-room facing Eccleston-place (2,000sq.ft.), and a ladies' room. The three rooms intercommunicate by doors. The two side areas are important points in the plan. The main side corridor is well lighted by it, and skylights are introduced over the news-room and reference library. The museum and committee-room are in front on the first floor, and the librarian has his rooms on the second floor; an early workmen's room is in the basement. High-pitched roofs are shown over reference library and news-room, with centre lanterns. The librarian is well placed for supervision, and the plan carefully distributed in its main lines. Another plan, under "St. George" on a shield, we believe, by Mr. E. W. Mountford, places the news-room along the main front, 64ft. 6in. by 30ft. 9in., with entrance on left side. An inner hall, lighted by a circular lantern, has the borrowers' lobby on the right-hand side, projecting into the lending library, which is 50ft. by 39ft., the outer wall of which is set back with area along this side are windows above bookshelves. There is also a domical lantern over. A short corridor from the hall leads to the ladies' room, the librarian's office, and the reference library, 40ft. by 26ft., in the rear facing Eccleston-place, with a side book store. On the first floor is the museum and committee-room in front, book store and librarian's rooms facing Eccleston-place. In the basement are a book store under lending library, and caretaker's rooms in front. The elevation towards Buckingham Palace road is in a quiet 17th-century style of brick and stone, drawn with considerable taste and feeling. Three segmental pediment of slight projection relieve the front; the parapet is straight and unbroken, and a high roof, broken by a flèche, is shown. The drawings are clever and well detailed, and

the drainage is shown. Another able design—that of "Ευρηκα"—bears the impress of Mr. Brydon's work, both in plan and elevation. The former has a strong resemblance to the Chelsea public library, the latter is a dignified 18th-century façade of brick, with an order of pilasters and rusticated stone dressings round windows, and a centre pavilion roof. The news-room and lending library are parallel, their ends towards Eccleston-place, and they leave side areas for windows. The reference library and ladies' room are in front on each side of entrance; the librarian's office is on the first floor. The plan of this floor has the museum in front, and a book store top-lighted over half of the lending library, the outer wall of the store being set back on iron columns in the latter. The news room is divided into three compartments by columns and coved ceilings with ventilating flues, and a flat span roof is shown over the whole back building. The Eccleston-place elevation is rather poor. "Dragon" is a clever set of plans; the lending library in front, reference library in centre, and news room behind, all transversely placed, the two former being separated by an area for light. Between the reference library and news-room is a glazed partition, and the apartments are well lighted. The librarian's office is not central; the elevation is Renaissance in style.

The merits of the plans submitted are so nearly balanced that it is a pity the committee should not have appointed a competent assessor to report upon them. The question of side-lighting by areas is important. Three authors have adopted the side area in addition to top light; the others have utilised the whole area of site by introducing skylights and lanterns. One desirable point—easy access to the lending department—has been considered by "St. George" and "Ευρηκα," who plan the borrowers' lobby close to or opposite the entrance. The advantage of having it within a short distance of the entrance, so as to avoid unnecessary traffic through the corridor or hall, is obvious. But if the lending library is near the front, the news-room ought, if possible, to be so too, as being more frequently visited than the other departments. The early-workmen's room is now almost an essential, and the authors have shown it in the basement, as provided by the conditions. How to light the main rooms and corridors in the most economical manner, having regard to the roofing of the departments and the two-storied portions of the building, is one of the main questions which the architects had to answer.

HOT-WATER ENGINEERING.—VII.

Supply of Hot Water for Baths and Domestic Purposes.

the cylinder system (*continued*).

FROM Fig. 19, which is reproduced here as the description has not been completed, it will be seen that the flow-and-return service is connected at the boiler in precisely the same manner as with the tank system, and, in fact, this portion of the work does not differ in any description of apparatus erected for this purpose. From the boiler it is connected into the side of the cylinder at the points shown, the return pipe being situated about 3in. from the bottom, and the flow pipe about 5in. above that; but it is customary and proper to continue the flow-pipe inside the cylinder, letting it stand up, reaching about half-way to the top, as Fig. 21. If the cylinder has no man-lid or removable top, then the flow flange should be situated half-way up, as Fig. 22.

The object of terminating the flow-pipe this much higher than the return is to carry the heated water from the boiler to the top of the cylinder, where all draw-off services are taken from. If we just terminated the flow low down in the side of the cylinder, as Fig. 19, all the heated water which passed up it would have to pass through a considerable body of cool or cold water before it could reach the draw-off service at top, and although no objection could be raised if the cylinder was full of hot water, it is rare that it contains hot water from top to bottom, as for every drop of water that issues from the taps,

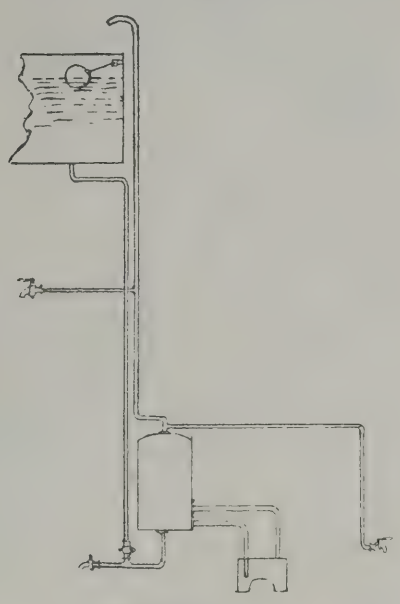

FIG 19.

a corresponding quantity instantly flows into the bottom of the cylinder from the cold-water cistern. The flow-pipe from the boiler should terminate in the cylinder about half-way up: a trifle higher would be no disadvantage. The flow and return pipes are never carried in through the bottom of a cylinder, as they can usually be carried in through the side conveniently, which has the important advantage of saving one bend in each pipe. Bends, as explained, are objectionable in the circulating pipes near the boiler, as being collecting points for lime deposit if the water be hard.

From the extreme top of the cylinder is carried a pipe which terminates above the level of the cold-water cistern, either turning over the cistern as shown, or being carried through the

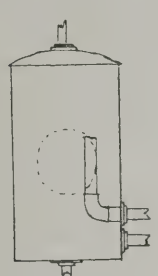

FIG 21

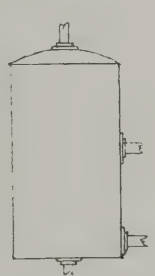

FIG 22

roof or outer wall. Wherever it is terminated, it must not be forgotten that hot water will most probably be ejected from it if the apparatus overheats—that is, if the boiler is fully powerful for the work. This pipe bears several names, but is usually recognised as the "rising main," and all draw-off services are taken from it. When this pipe is returned, as will be described directly, it can then be reasonably described as the secondary flow and return. It is very necessary to see that this rising main service does not project inside the cylinder in the least degree; if it does, an air-chamber will be formed, which will be a perpetual source of annoyance, and be a demonstrative evidence of careless workmanship.

The cold supply is brought down by a direct service from the house cistern to the cylinder, entering the bottom with the necessary dip, as shown, and with a stop-cock at the point indicated. There is a particular advantage in having the stop-cock at this point, as when the boiler needs cleaning out, or other attention, and has to be emptied, the water can be shut off and afterwards turned on without the man leaving the kitchen probably, whereas if the cock was placed up near the cold cistern, it would necessitate the workmen traversing the house from bottom to top twice, at least. It is very important that the stop-cock have a full way through it, that is a 1in. cock should have a clear bore through it of 1in. diameter when it is turned on, otherwise it follows as a matter of course, that a check to the inflow of cold water will be experienced, which must necessarily be a check to the outflow of hot water at the taps. The water will not flow out of the apparatus faster than it flows in; in fact, it is always slower, more or less, as the water experiences a resistance by friction in its passage through the ramification of pipes.

The stop-cock must also have a loose key that should be kept by a responsible person, and it should only be intrusted to responsible workmen, although, in this apparatus, a stoppage of water supply would not be the element of danger it would be in the tank system, for in the cylinder system the hot-water reservoir cannot be emptied unknowingly.

An essential feature in this system is a draw-off service connected at some point below the cylinder, expressly for emptying purposes. It will be seen that, as no ordinary draw-off services are taken from any point below the top of the reservoir, it becomes almost impossible to empty it, when it is necessary to clean the boiler or do anything which requires the withdrawal of all the water in the apparatus. If the special emptying service is not provided, then the water can only be got out by loosening the boiler manlid, and permitting it to flow into the kitchen—a most objectionable resource, but nevertheless of frequent occurrence, as the service under discussion is very commonly forgotten.

Sometimes a fitter will, instead of providing an emptying service, introduce a stop-cock into each of the pipes, between the cylinder and boiler, so that when the boiler has to be opened the cocks are shut off, and, by so doing, the necessity of emptying the cylinder is avoided. This is one of the worst of practices on account of the danger it creates. It is only a short time ago that a practical man—a plumber—lost his life by this cause; he having forgotten to open the stop-cocks when the boiler lid was secured after cleaning it. Shortly after he had lighted the fire to test and see that all was correct, the boiler burst. A slight moisture in the boiler would permit of sufficient steam being generated to effect this.

The emptying service can be connected at any point under the cylinder, not forgetting that the water drawn from it has to be carried away in a pail, so that it should be at a convenient height and position for this purpose. If it were possible to terminate it over a sink or gully, it would prove particularly convenient. The cold supply pipe is a favourite point for connecting this service to; but, of course, it must be on the cylinder side of the stop-cock, as shown. This, however, still leaves a little water in the pipes to flow out from the boiler. To quite empty the boiler as well, the service would have to be taken from the boiler itself, and either brought through the jamb or through the back wall. It is very necessary that this tap have a loose key, which should be kept in a responsible person's charge, together with the key of the stop-cock. This is important, as if the tap is used in the ordinary way, the chief and most valuable feature—the safety—of the system is disposed of, as it would permit of the cylinder being emptied unknowingly, should there be a failure in water supply.

The advantages of the cylinder system consist, firstly, in the fact that a shortness of water is not an element of danger, as there is no means of emptying the cylinder and boiler (except by the special emptying service); consequently an explosion or a fracture to the boiler cannot be brought about by this cause, as it would take a fairly long time to boil and evaporate 50 or 60 gallons of water away. The importance of this advantage cannot be over-estimated. In the long frost that occurred last winter, and which interrupted the water supply so seriously, the cylinder system undoubtedly saved many boilers, as well as permitting kitchen ranges being used under circumstances that would have been highly dangerous with the tank system.

This advantage is more greatly appreciated in country residences where the water supply is commonly most uncertain, an odd man's attention to a pump being the only means by which

the house cistern is kept supplied. Sometimes the pumping is done by wind power or by a caloric engine; but in any case it is the regular thing for the water to run short occasionally at unexpected times, unless the house is supplied from a town's mains.

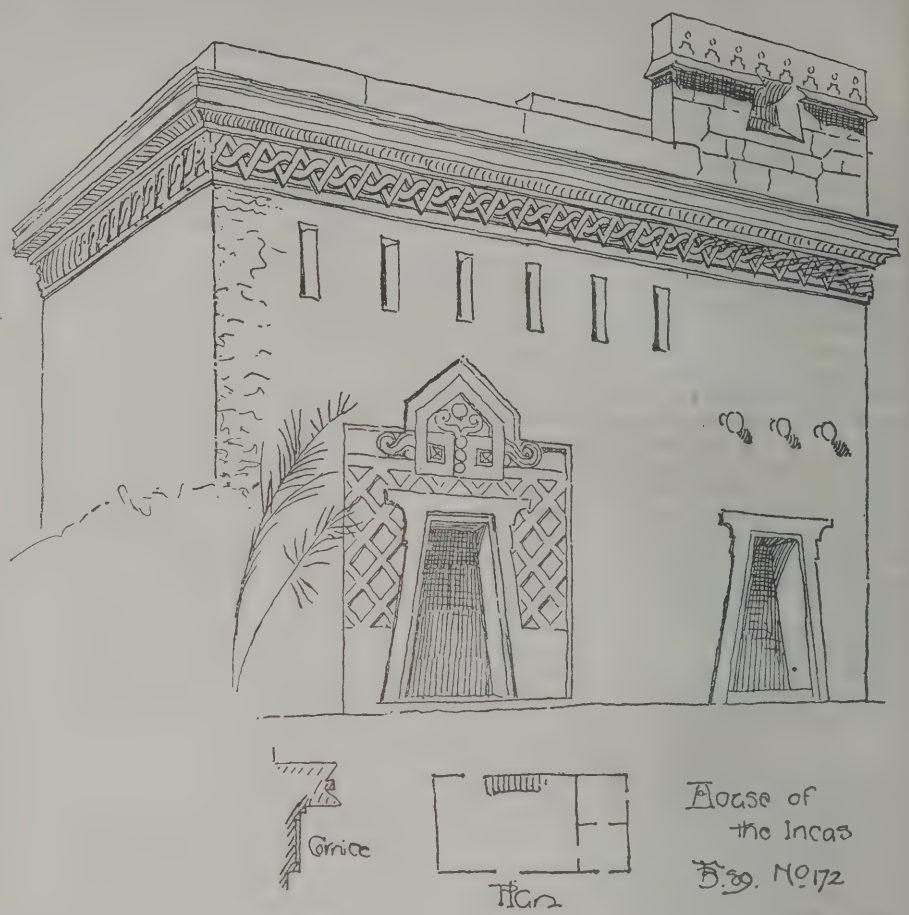
A second and equally important advantage of the cylinder system over the tank apparatus is the nearness of the reservoir to the boiler. Of course, the chief object aimed at in the erection of an apparatus is to arrange for the reservoir to be filled with hot water in the shortest possible time. The quicker we can obtain a store of hot water the better pleased the user of the apparatus is, although, as before mentioned, the rest of the erection must be carried out so that the hot water can readily be withdrawn without admixture of cold or reduction of temperature. Now the difference in period of time between the heating up of a cylinder down by the boiler and a tank up at the top of a house is very great (other circumstances being equal). The distance which the water has to go, of course, materially affects the time in which the reservoir water becomes hot; but, apart from this, the long circulating pipes of the tank system, extending through passages, up casings, and in all sorts of more or less cold situations, get robbed of heat to a most material extent, unless they have been well covered with felt. Although felting pipes is a most desirable thing, and will be spoken of more fully presently, it is seldom done. The method for carrying out the cylinder system for larger works will be treated in the next paper.

THE "HISTORY OF THE HABITATIONS OF MAN."

By Banister Fletcher, Jun.

(*Continued from page* 67.)

THE "Soudan House" (167) is relatively modern, earlier information not existing, and has been built from indications received from various travellers of our own day. It was in the 11th century that the Mohammedan religion penetrated into the Soudan; but it is not supposed that even this invasion could have influenced much the type of dwellings necessitated by the exigencies of the climate. The sketch

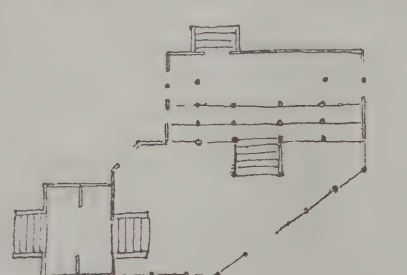


shows the type of building constructed by Charles Garnier. It is characterised principally by few and small openings to keep out the intense heat, and is crowned by a peculiar type of battlemented parapet.

This finishes the second part of the historic period into which M. Garnier has divided the "Histoire," and brings us to the third section, which is the *Civilisation contemporary with Primitive Civilisations* (*section* 1 *of Historic Period*), but which held itself entirely aloof from it, and exercised no influence on the general march of mankind. This has been divided into three principal parts:—

1. The yellow races: Chinese, Japanese, Esquimaux.
2. Negro races: Central Africans.
3. Indigenous populations of America: Red Indians, Incas, and Aztecs.

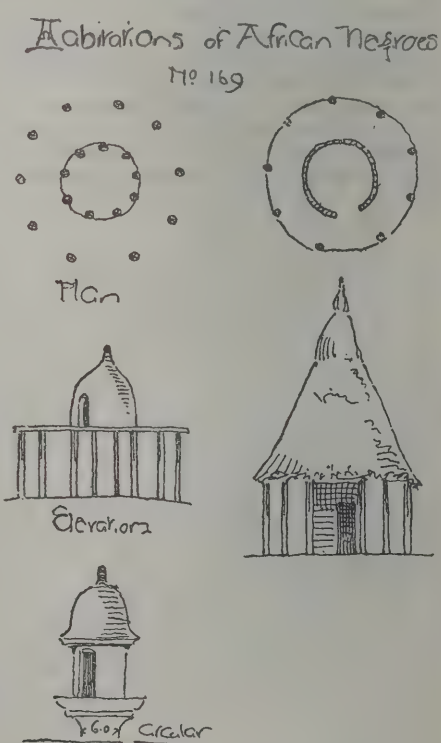
We will now, therefore, proceed to examine their dwellings.



The Japanese and Chinese Houses (168) have been erected from numerous treatises on the subject, and M. Garnier has endeavoured, by marking the Japanese house with refinement,

and the Chinese with a feeling slightly vulgar and common, to distinguish between the two, which in their *tout-ensemble* resemble one another somewhat closely.

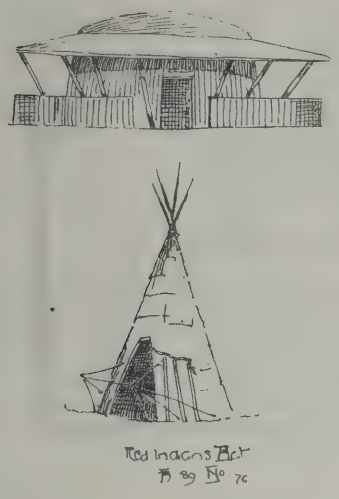
The date of the Japanese house is taken at the time when the first European navigators landed there in 1542.



Habitations of the Esquimaux and Laplanders are represented by two huts—a summer and a

winter one. The summer hut is composed of skins of seal and reindeer, the winter hut being formed of large blocks of ice, the entrance being effected by crawling under an opening. These were the Esquimaux dwellings when, in the 10th century, the Scandinavians first came into communication with them.

The Negro races of Central Africa are represented by three types, sketches of which I give (No. 169). The first one is taken from Egyptian painting 1500 B.C., relating to the exploits of Rameses II. (Sesostris). Explorers of Central Africa in the present century have also described huts exactly similar. These huts are built of wood and straw, and are covered with mud, are small, and in a circular form, the absence of a



strong inclosure often causing them to be raised on piles, by which they are ascended by something in the form of a ladder. These evidently are an attempt to get out of the way of vermin, or perhaps water in flood time.

The Red Indians, or indigenous people of America (now disappeared), are represented by

three tents (No. 170) formed of skin and wood framing, and give us a sample of the habitations of the savage North American tribes at the time when Christopher Columbus discovered the New World in the end of the 15th century.

The House of the Aztecs of Mexico (171) consists of one large room, and has a peculiar gable, the outline of which is formed nowadays by a mansard roof. The sloping roof covering is performed by stepping courses of stonework, on which rests terra-cotta vases, &c. Above the sloping part is a flat roof. The building is massively constructed in stone, and recalls to a certain extent—as, for example, the reeded ornament to the walls—the distinctive features of the Assyrian habitation at the other end of the Quai d'Orsay, only here we have it in stone. It

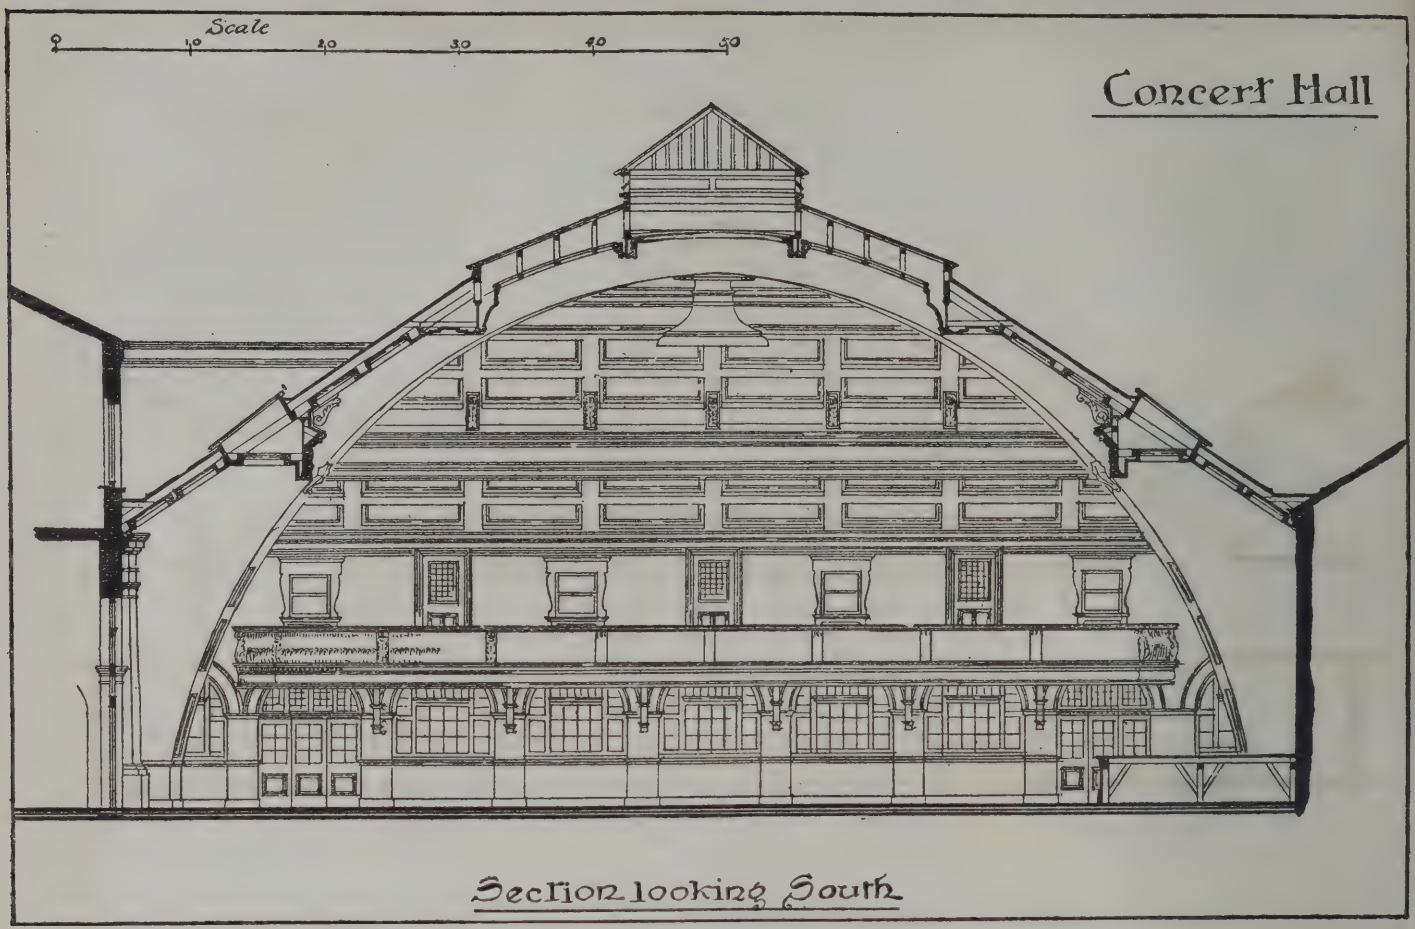
seems obviously to have descended from timber construction.

The Habitation of the Incas (No. 172).—The Incas were the ancient inhabitants of Peru; they were conquered by Pizarro in the beginning of the 16th century. It is a massively built construction in stone and plaster, with narrow openings, and a flat roof and doorways with sloping jambs, as in the Egpytian building at the commencement of the "Histoire," which it

resembles in its massive construction and heavy cornice, the entablature in this case containing a sculpture frieze with ornament in low relief. In the architrave to the principal doors is also the characteristics cavetto of the Egyptian buildings.

Although, without the explanation given at the commencement of these notes of the sequence adopted by M. Garnier in his distribution of the "Histoire," the models of the Habitations may appear placed without any special order or reason, it will be seen that the buildings have been grouped by M. Garnier according to a table prepared, and which renders it perfectly intelligible. The buildings are mostly constructed in brick nog walling and plaster of Paris, and the details are worked with an extraordinary amount of care, considering that it is only a temporary exhibition; and M. Garnier must be congratulated on the fact of his being the first architect ever called upon to present to the public, by means of in some instances natural-size models, showing in a fairly thorough way the history and character of the dwellings of the peoples of the earth from pre-historic times up to the present day. That it is, in many cases, incomplete is of course only natural, considering the want of time, space, and money at M. Garnier's disposal; but with all these impediments, that it could have been better done, is not likely, and it may be said to give a very good idea indeed of the dwellings of all times.

ARCHITECTURAL ASSOCIATION EXCURSION PROGRAMME.



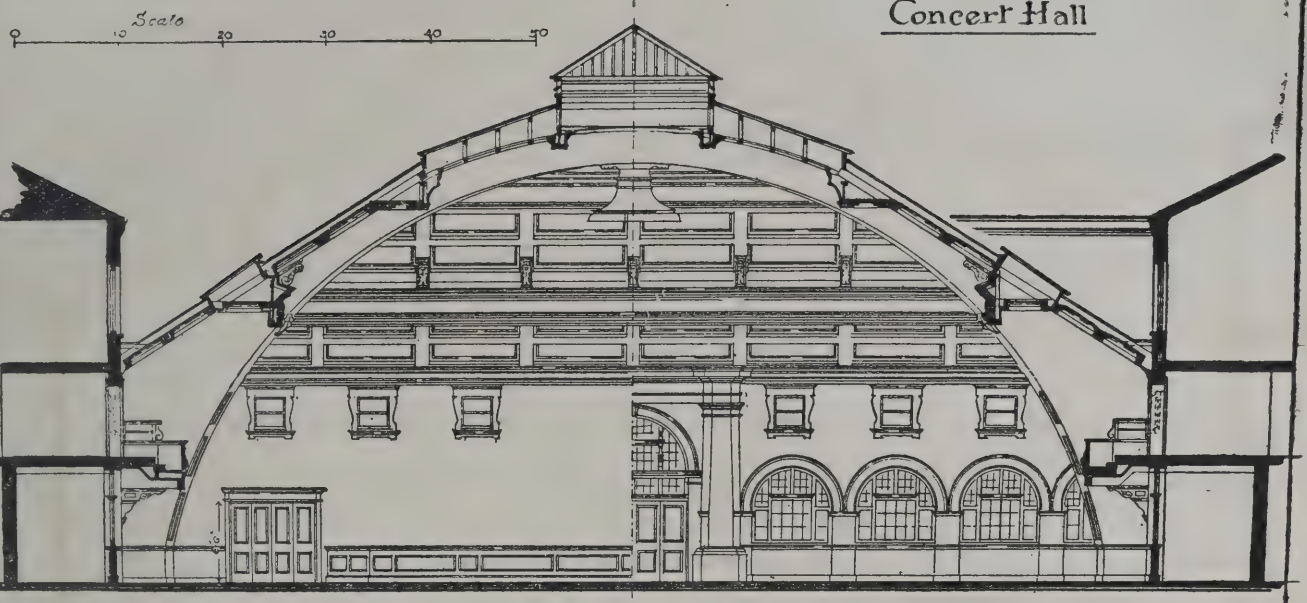
THE following is the provisional list of places to be visited from Shrewsbury as headquarters by the excursion members of the Architectural Association during the week commencing August 10th:—*Monday*: Wroxeter, where the Norman church with fine 16th century altar tombs will be seen, and the remains of Ur-i-Conium, founded in the reign of Trajan, will be passed near the site of Watling-street-road on the way to Buildwas Abbey, where the beautiful ruins of one of the finest Cistercian churches in the West of England will well repay a visit. Benthall Hall (originally Benethall), erected in 1535, the next halting place, is a gabled house with lofty chimneys, and the day is to conclude with Much Wenlock, seeing the picturesque gatehouse, the beautiful 13th-century Priory church remains, and the justly celebrated Prior's house, still perfect. *Tuesday* is to open with Plaish (Plash or Plush) Hall, which is said to resemble the famous house at Compton Wyneates, in Warwickshire. Plaish Hall is a good Tudor brick-built house, with a fine hall and very rich Elizabethan chimneys. The remainder of the day is to be devoted to Shipton Hall, erected in the middle of the 16th century. It has a tower quaintly grouped midst three gables on the garden side, and a very fine hall within. *Wednesday's* programme commences at Albright Hussey, an ancient moated mansion, dated on the entrance-porch 1524. The house is partly half-timbered, with additions made about the year 1560 in stone. Battlefield Collegiate Church follows. Shawbury is down next, and then the magnificent ruin of the Renaissance mansion at Morton Corbet. Haughmond Abbey, also a ruin of eminent picturesqueness, is to follow, chiefly remarkable for its monastic remains, and the day is set down to conclude with Lundorn. *Thursday* will be well occupied with Stokesay Castle and Ludlow. *Friday's* work is to begin at Pitchford Hall, a many-gabled, big timber house forming three sides of a court, and having very handsome chimneys. Acton Burnell Castle, with its four stone-built towers, is all that remains of another ancient country seat of somewhat later date than Stokesay, with Geometrical tracery to the windows, and very similar to the Palace at Wells, which was also erected by Bishop Burnell. It is now used as stable buildings. The fine Elizabethan mansion at Condover, the Hall of the Owens, some three miles south of Shrewsbury, concludes the day. *Saturday* will be occupied by examining the glories of Shrewsbury itself, the Renaissance market house and grammar school; St. Mary's celebrated church; "Whitehall" in the Abbey Foregate, with its Gate, Lodge, and Pigeon-house; the Abbey Church, and the several old timbered houses about the town. This brief outline of the proposed proceedings sufficiently indicates the attractions in store for those who will take part in the excursion this year.

OVER-CHARGED SEWERS.

THE danger attending sewers over-charged with storm-water has been pointed out very often. The Select Committee of the House of Commons which has been inquiring into the ventilation of the House has again brought the question before the public. The sewers in Westminster, like most of those in London and elsewhere, carry off not only the sewage but the rainfall and storm water. But there was the possibility, as Mr. Binnie pointed out, of the sewer being full of sewer gas, that when storms occurred and displaced the gas, the latter would escape, either into the streets through the iron gratings, or into the houses by the bursting of traps. Major Tulloch and Sir Joseph Bazalgette had reported to this effect in 1885, and the latter proposed that the sewer should be abolished and a pipe sewer substituted. With the stopping up of the street ventilators there is a danger of the gas accumulating in the sewers, and escaping through the traps of houses; but where the ventilators are kept open, and pipes are also carried up the houses, good ventilation is insured. Mr. Binnie recommended a ventilating-pipe carried up the side of the Clock Tower. The question of storm-water conveyance is one that will have to be dealt with in London before long. The sewers, especially the low-level sewers, are getting every year too small in capacity to carry away both the sewage and the storm-water. The only remedy is to divert the rainfall into separate conduits, or to enlarge the sewers. The floodings in the Metropolis of late have been considerable. The storm on the 17th of July is estimated at 2in. of rainfall—on some areas 1in. fell within an hour. The Main Drainage Committee have, we believe, been discussing the necessity of providing additional outfalls—a new outfall sewer is contemplated between Old Ford and Barking. The great evil, as we have pointed out, is the very low basements allowed in some districts. These should never be lower than the levels of the sewers; but thousands of houses in London have their basements below. The London County Council have decided to apply for powers to enable them to prevent this state of things, and to make it unlawful to erect any dwelling upon land of which the surface is below the level of Trinity high-water mark, or which is subject to flooding. Better late than never; but we wonder why the old Board allowed this condition to remain so long. The sewers in the Metropolis are subjected to great pressure at periods of heavy rainfall; the consequence is that the traps are rendered powerless to prevent the escape of gas and the flooding of basements. Ventilators in the form of pipes carried up the sides of lofty buildings will avert the danger of sewer-gas escaping into houses, and, to a certain extent, of the bursting of traps and flooding. It is one of the remedies which ought to be generally adopted, especially in those parts were outfalls cannot be made. We hope the committee intrusted with this work will lose no time in obtaining Parliamentary powers to deal with the question, and that no objections of a trivial character will be permitted to obstruct such a necessary measure.

THE GOLDSMITHS' COMPANY'S TECHNICAL AND RECREATIVE INSTITUTE, NEW CROSS, S.E.

THE Prince and Princess of Wales opened these buildings on Wednesday, and we give the plans of the two principal floors with details of the great hall to-day. The site comprises the buildings and land recently occupied as the well-known Royal Naval School, the foundation stone of which was laid by the late Prince Consort on "the glorious 1st of June," 1843. On the removal of the school to country quarters, the Goldsmiths' Company purchased the building and about seven acres of land, and with considerable re-arrangements and additions have adapted them to the present purposes under the direction of Mr. J. Wornum Penfold, architect, the surveyor to the Goldsmiths' Company. The old buildings formed the four sides of a quadrangle, or open space, of nearly 100ft. square, and with their numerous classrooms, large dormitories, and general schoolroom, lent themselves better than could have been expected to the change of circumstances. The front of the main building is retired on rising ground from the Lewisham high road, giving space for a garden with carriage approach to the main entrance and footways to the separate departments for men and women. In general terms it may be said that the men's classrooms, the workshops, &c., occupy the right or northern wing, and the women's department the left or southern. On the ground and mezzanine floors of the main front are the rooms of the resident secretary, Mr. J. S. Redmayne, the administrative offices and bookstall, at which students can purchase their classbooks and other requisites at moderate prices. The first or principal floor is devoted to library and reading and news rooms, 100ft. by 28ft., approached by separate staircases from the men's and women's departments. Additional book-stores are arranged in the mezzanine below, communicating direct with the library. The northern wing is occupied on the ground floor by the refreshment room, 90ft. by



GOLDSMITHS' COMPANY'S TECHNICAL INSTITUTE, NEW CROSS.

24ft., served by new and carefully arranged kitchens, with their necessary adjuncts. Beyond this, and in proximity to the gymnasium and workshops, are the men's lavatories, with hot and cold water, locker rooms, men's club-rooms, &c. In the mezzanine over these are the clay-modelling rooms, and other smaller rooms for the use of some of the masters, and for chess and other games. On the lofty first floor is the men's social room, 50ft. by 35ft., and, approached by separate staircases, the art class rooms, having a total extent of about 200ft. by 35ft., divided into elementary and advanced drawing, life study, dressing-rooms for the models, lavatories, cloakrooms, &c. Approached from the ground floor of this wing are the engineers' workshops, 70ft. by 30ft., and large electrical laboratory, all fitted with the best appliances. Adjoining the engineers' shops is the engine which drives the whole of the machinery and the pumps, drawing water from a deep well sunk into the chalk for the general supply of the establishment, and for filling the swimming-bath. Here are also the boilers, which supply steam for the engine, for the general warming of the buildings, and for heating the water of the swimming-bath. In a block near to the engineers' shop, and having its machinery connected with the main driving shaft, is the carpenters' shop, with large class or lecture room over, also several smaller rooms destined for type-writing, commercial classes, and such of the less important branches of trade as it may be found necessary to accommodate. The south wing, or women's side, contains, on the ground floor, class-rooms for needlework, cookery, and general instruction, women's lavatory, cloak-rooms, &c.; also a large class-room, to be used chiefly for physical or other scientific demonstration. In the mezzanine are several private rooms and rooms for games, for small classes, or meetings. On the first floor is the women's social room, 40ft. by 35ft., the chemical department, about 150ft. by 35ft.: adjoining is the balance room, chemical lecture room for 70 or 80 students, demonstrators' preparation room, &c. Above this are the photographic studio, dark room, &c. In connection with the technical department must also be mentioned the old school chapel, capable of seating some 500 people. It is detached from the other buildings, and can be also approached from the public road should it be found desirable at any time to admit other than members. It has been deconsecrated by special Act of Parliament, an additional room has been added, and it is intended to be used as a general lecture hall, and for lantern exhibitions, or for large musical classes, as occasion may arise. In the recreative department is the large concert hall, which occupies the site of the central quadrangle before mentioned. It is 98ft. by 88ft., and is approached in connection with the principal entrance. As it was necessary to preserve the light and air for the upper story of the buildings round the quadrangle, and the existing walls were not of sufficient strength to carry a roof of so great a span, a special and somewhat novel method of construction has been cleverly adopted. Curved lattice ribs of great depth, bolted down to special foundations, spring direct from the floor level in the four corners of the hall. Uniting at the apex about 40ft. in height, these form two diagonal arches of 125ft. span, leaving the whole surface of the floor free and uninterrupted by columns or other supports. Lattice girders or purlins of 68ft. span, 25ft. from the floor, with others of less dimensions carry the rafters and covering of the roof. The hall is well lighted from the roof at the junction of the main ribs, and by a series of skylights at a lower level. The platform and galleries for chorus are on the western side of the hall, and a fine organ is in course of construction by Messrs. Abbott and Smith, of Leeds, at a cost of some £2,000. The floor of the hall will seat about 1,300 people, according to County Council requirements, besides performers and chorus of about 100 persons. On the mezzanine level are galleries to hold 200 to 250 with independent staircases. Care has been taken to provide sufficient exit in case of panic among the audience. There is a spacious corridor on all sides of the hall, and besides the main entrance doors on the western side, which are 10ft. in width, there are two of 7ft. in each of the other sides, with corresponding doors in the outside walls of the building, giving on to the open ground. The galleries are approached by similar corridors on the mezzanine floor, and special external escape stairs lead from each to the grounds outside the building. The details which we show in our plans and sections explain the construction of this great hall. Immediately at the back of the great hall is the gymnasium, about 100ft. by 38ft., which has been adapted and enlarged from the old Royal Naval school-room. On one side of this is a gallery from which spectators can watch the special gymnastic displays which will take place from time to time. Here also will be fixed the motors for supplying air to the organ. To the north-west of the principal buildings, and connected therewith by corridors is the new swimming-bath, 90ft. by 50ft., the pond itself being 80ft. by 30ft., with a capacity of about 80,000 gallons. The bath is supplied from the well, the West Kent Water Company's mains being also connected for use in case of need. From the well the water passes through a heater, and is discharged into the bath as a cascade. By means of a centrifugal pump a continuous circulation is kept up, water being abstracted from the bath, passed through the heater, and returned by the cascade at the rate of some 6,000 or 7,000 gallons per hour, with any fresh water required to make up for loss while the bath is in use; a uniform temperature of about 72° is thus retained. On each side are a number of dressing-boxes, over which are galleries for spectators. There is a separate entrance to this bath from the public road, so that it may be available by arrangement for schools, outside clubs, or such of the public as may be admitted on specified conditions. The old school swimming-bath will probably be made available for private hot and cold baths, should there be a demand for them. Extending along the back of the building is a large paved court of about 2,000 square yards, which will be available for various games, drill, and general exercise in the winter. Beyond this is the recreation ground, about 4½ acres in extent. At considerable cost this has been levelled, and a good running track laid out of about four laps to the mile. Inside the track is space for cricket, tennis, or football. The cost of the various alterations, about £70,000, has been paid by the Goldsmiths' Company. Mr. Thomas Lee acted as clerk of the works, under the direction of the architect. Messrs. Kirk and Randall, of Woolwich, are the general contractors.

THE VICTORIA COURTS, BIRMINGHAM.

(See description and sketches on page 128.)

ALL SAINTS' CHURCH, BRAYBROOKE.

This church, an interesting specimen of the 13th-century architecture, is one of a series in the forest of Arden, built by order of King John, and was commenced soon after the year 1200, probably on the site of an old one. It was in almost a ruinous condition, owing mostly to neglect, partly to lapse of time, and also to damage done by lightning. The restoration scheme included the making good of the serious dilapidations of roof, and restoring, beautifying, and generally improving the church. The tower and steeple have been taken down and rebuilt, and a lightning conductor placed in position. All external walls have been shored up, the foundations underpinned and insecure portions were also taken down and rebuilt. The lead, boarding, rafters and roof timbers were removed and re-used as far as practicable in framing the new roof. All parapets were raised and rebuilt, and a new parapet built over chancel arch gable, and all arches of windows and doors where cracked taken out and new arches inserted. The plaster of the walls (except tower walls and where coloured decoration was discovered) and all lime-white have been removed, and the stone dressings re-dressed and pointed. All the old pews were taken to pieces and re-framed as panelling to be fixed to walls. The walls above the panelling were finished in rough stucco. All wood floors were taken up and relaid with wood blocks on 6in. concrete. The nave is seated with low benches and two rows of choir stalls placed in the chancel. A new east window to chancel, new chancel arch, new and restored screens, and new cover to font have been completed, together with a new altar, new pulpit, new lectern, heating (Grundy's patent), and general improvements. The total cost has been about £1,800. Messrs. Giles, Gough, and Trollope were the architects. These drawings are now on view at the Royal Academy exhibition.

THE GOLDSMITHS' COMPANY'S TECHNICAL INSTITUTE, NEW CROSS.

(For description and further illustrations see pp. 104-5)

COLFE SCHOOLS.

These schools have been recently erected upon Lewisham-hill for the governors of Colfe's Grammar Schools (now represented by the Leathersellers' Company). They comprise on plan a large central hall with open timber roof, from which six class-rooms open direct, master's and assistant masters' rooms, cloak-rooms, caretaker's rooms, and all the necessary offices. They are built of red brick with dressings of Ancaster stone and slated roofs, and are heated throughout by hot water. Messrs. Giles, Gough, and Trollope, 28, Craven-street, were the architects, Mr. Willcock, of Wolverhampton, was the builder, and Messrs. Berry, of Westminster, carried out the heating.

ST. STEPHEN'S VICARAGE, GUERNSEY.

This vicarage has been lately completed at a cost of only £1,200. It stands in a plot of ground adjoining the church of St. Stephen commanding beautiful views. Mr. G. F. Peek, of Delancey, was the contractor.

THE CHURCH TOWER, MANSFIELD WOODHOUSE, NOTTS.

In the year 1305 the church at Mansfield Woodhouse was burnt down, and the tower shown in sketch is what remains of the church built after this fire during the same century. The rest of the church is quite modern, the nave being rebuilt in the year 1858, and the chancel in 1878, and since the latter date a projecting porch has been added on the south side, similar to one on the north side. The church is prettily situated in a secluded churchyard surrounded by trees, but unfortunately the boundary-wall and adjacent houses are so near the church on the west and north sides as to preclude a view being taken from the west. The tower is built of a grey-toned stonework, much covered with lichen, and the effect is a pleasing combination of solidity and picturesqueness. In the early part of the present century a shock of earthquake was felt, while service was being held in the church, and this probably accounts for the iron bands on the spire. The sketch we publish is by Mr. H. Harrington.

CHOIR STALLS, SCREEN, ETC., AT ST. PAUL'S CATHEDRAL.

The stalls of St. Paul's Cathedral are divided into two bays on each side of the choir. The eastern bay on south side is illustrated this week, the drawings of which obtained the Royal Academy Silver Medal for measured work in December last. The greater portion of them were plotted on the spot to 1½in. scale, details being very carefully taken full size with a lead-tape, and the finished drawings to 1½in. scale were collated from this information. According to Dean Milman (*vide* "Annals of St. Paul's," chap. xvii. page 447), the design was by Sir Christopher Wren, and the carving executed by Grinling Gibbons, the whole being carried out in oak, with the exception of the figures, the swags of fruit and flowers under gallery, and other delicate portions of the carving, which are in a lighter-coloured material, possibly satin or limewood. The wrought iron grilles which fill in upper panels of doors, and openings on staircases, were the work of Tijou ("Longman's History of 3 Cath. of St. Paul's," chap. x. page 145). The throne in the centre of the stalls on south side is the one usually occupied by the Bishop of London; but on some occasions, when the Archbishop or other Bishops are present, the more elaborate throne on the east is used by him as Bishop of the Diocese.—Charles W. Baker.

GROSVENOR HOTEL, HULL.

The Grosvenor Hotel, Carr-lane, Hull, which we illustrate this week, is now in course of erection from the design of Mr. W. Alfred Gelder, A.R.I.B.A., of 12, Bowlalley-lane, Hull. It is designed to meet the joint requirements of a café and hotel, with accommodation for 64 beds, including dining-hall, café, billiard-room, &c., for the joint purposes. It will be lighted by electricity throughout. The building contract is being executed by Mr. Fred Blackburn, of Hull. The total cost of the building will be about £12,000.

We are glad that one of the 17 large gold medals given to exhibitors of all nations at the Jubilee Art Exhibitions recently held in Berlin has been awarded to Mr. Alfred Waterhouse, R.A. The other British artists similarly honoured are Mr. Stanhope Forbes and Mr. J. J. Shannon. Four of the 73 smaller gold medals have gone to British exhibitors—viz., Messrs. Colin Hunter, R.A., J. Pettie, R.A., Marcus Stone, R.A., and Onslow Ford, A.R.A.

COMPETITIONS.

Sheffield.—The Sheffield School Board recently instituted a competition for plans for the additions to the Central Higher Grade School, and a new elementary school to be erected in Holly-street. The Central School was the first of its kind erected in England; but since then improvements have been made on that experimental effort, and it was desired that Sheffield should not fall into the rear, but that the high grade school appointments and fittings should be brought up to date. The designs marked "Labore et Perseverantia" were selected, and on opening the sealed envelope it appeared that these were designed by Mr. J. B. Mitchell-Withers, of Sheffield; the sum of ten guineas was awarded to Mr. C. J. Innocent, whose designs came next in order of merit. The additional buildings will include the following departments: — In the basement — cookery classes, dining-rooms, joiners' shop and metal-working shop, and laundry; on the ground floor — machine drawing and lecture rooms to accommodate 120 students, physical laboratory, and lecture-room for 50 students; first floor—chemical laboratories for 140 students, and lecture-room, balance-room, and other necessary stores. The present school will be modified to suit the new arrangements. The Peripatetic Demonstrators' Department at the corner of Orchard-lane and Holly-street contains preparation room, joiners' shop, offices, and stores, with the caretaker's house adjoining. The elementary school building is placed at the corner of Holly-street and Bow-street. The accommodation provided is for 292 infants on the ground floor, and with a mixed school for 250 on the first floor. A playground is provided on the top of the building, and the basement is devoted to workshops and playsheds. The style adopted for the buildings is that of the English Renaissance, to harmonise with the present schools and offices, which were designed by Mr. E. R. Robson, F.S.A.

CHIPS.

In Tuesday's *Gazette* the name of Joseph Higgs of Upper Park-place, Dorset-square, builder and contractor, appears in the list of adjudications in bankruptcy.

Some fresh stained glass for the windows of the Roman Catholic Church of Our Lady and St. Cuthbert at Prudhoe Hall has been executed by Messrs. Atkinson Brothers, of the Oxford-street Stained Glass Works, Newcastle-on-Tyne.

In our notice of the new banking premises, now being erected at Warrington for the National Provincial Bank of England, on p. 96 last week, we should have said that the architect is Mr. Charles R. Gribble, of London (who is the Bank's standing architect), and the contractors are Messrs. Robert Neill and Sons, of Manchester. New banking premises for the same bank are now in course of erection, under the same architect, at Newport, Mon., Bristol, Cardiff, Boston, Barry Dock, Hartlepool, and Bedminster; and alterations at Bournemouth, St. Martin's-le-Grand, and Bishopsgate-street, London.

At the last meeting of the board of guardians of the several parishes included in the Holbeach Union it was decided to make extensive additions to the existing infirmary, and to erect a new block of infectious wards and administrative offices, in accordance with plans prepared by Mr. Joseph Sawyer, F.R.I.B.A., of 63, Chancery-lane, W.C.

The foundation stones of a Nonconformist cemetery at Buckley, Flintshire, were laid on Tuesday week. The ground is two acres in extent and the buildings, including a chapel and caretaker's house, will be erected from plans by Mr. R. Owen, of Liverpool, Mr. R. D. Davies, of Buckley, being the contractor.

The Midland Wire Cordage Company, of Orchard Works, Vincent-street, Birmingham, have just issued a catalogue of their specialities, which will interest architects and builders. Their safety lightning conductors are especially worthy of notice.

The Hungarian Minister of Ways and Communications inspected, on Tuesday, the works for regulating the flow of water at the great cataract of the Danube at the Iron Gate. The locks of the future Ship Canal are half-completed, and the work of blasting the rocks is being actively proceeded with.

An addition to the hotel at Fowey is rapidly approaching completion. It includes 20 bedrooms and dining-room, billiard-room, and smoke-room. The addition will make the hotel more than a large again. The cost will be about £5,000. Mr. Isbell is the contractor, and the architect is Mr. H. J. Snell, of Plymouth.

WAYSIDE NOTES.

IF the City Corporation will deal generously with the Government, the proposed Gallery of British Art will become an accomplished fact. The Government have offered to purchase a site between the City of London Schools and the Temple, and expect some concession on the part of the Corporation, so far as concerns the price to be paid for the land. Most persons think that the Corporation should meet the Government, and not demand the full value of the site. It certainly seems only reasonable to expect that, inasmuch as the whole matter has been the outcome of generous gifts and concessions; the "City Fathers" might also do something to help on a good cause. The site on the Embankment is well suited to the purpose, and it will also be a good thing to have a monumental building in this position. Hitherto the edifices placed along the Embankment have together had a monumental effect, however much some, individually, may be open to criticism. It would be a pity to spoil the general effect by the introduction of a commonplace type of building, there being always some chance of such an eventuality. The placing of the new gallery on the proposed site will lessen the chance of spoiling what is perhaps the very finest prospect in London.

In the matter of the proposed Campo Santo at Westminster, Mr. Waterhouse has written to the *Times*, explaining his reasons for adhering to the Refectory site in preference to the one proposed in the Old Palace-yard. The writer explains that the approaches to the chapel, proposed on the refectory site, would be much better than to the building proposed in the Old Palace-yard. Approach to the latter would be rambling, and the building moreover would be in competition with the old work, besides hiding the Chapter House. Mr. Waterhouse likes Mr. Pearson's design for the chapel—if so it may be called—in the rear of the great cloisters. You gave an illustration some time back of this design, and most architects will have been pleased with its effect. It is to be hoped, therefore, that this will be the plan adopted, and that the work will be duly carried into execution. The deadlock of the Royal Commissioners was most unfortunate, however, and may put matters back indefinitely. It must be most puzzling for those who have finally to decide on a site, and one might well excuse a feeling of irritation on their part, that a Commission should have been appointed with so feeble a result. If it should be any assistance to such to know what the architectural world think about an architectural question, then I feel sure they need not doubt but that the sympathy of the profession is with the Refectory site, not necessarily because Mr. Waterhouse favours it, but because it recommends itself both on practical and artistic grounds, and is not out of harmony with an architect's feelings for old-time architecture.

Mr. Waterhouse, I see, has been awarded a large gold medal for his exhibits at the International Art Exhibition at Berlin. He thoroughly deserves it—redeeming English architecture as he does in the eyes of the world from its present rather commonplace character. Foreign countries can't knight bishop's sons; but it is evident they confirm the suffrages of the readers of the BUILDING NEWS recorded long ago as to who is the leading British architect.

"C. P. S.," evidently familiar with railway engineering, and perhaps himself familiar to many readers of the *English Mechanic*, writes to the *Standard* of Wednesday last *re* the Swiss railway bridges. The writer says that the recent disaster near Basle has awakened the Swiss railway authorities to the necessity of strengthening a great many of the iron bridges on their different railways, which, with the exception of the St. Gothard railway—in every respects first class—are all more or less of a light character, intended chiefly for light traffic and low speeds. The main lines radiating from Basle to Berne and to Zurich are better, but even on these the mode of carrying the permanent way over the bridges is objectionable. "C. P. S." visited the four viaducts on the Zurich main line, viz., those at Brugg, Thurgi, Baden, and Wettingen, which cross the Swiss tributaries of the Rhine—the Aar, Reuss, and the Limmat. Three of these viaducts are of iron, and vary from 500ft. to 1,500ft. in length, with spans of from 100 to 200ft., the rails being from 100 to 130ft. above river level. Two of the viaducts are of the ordinary lattice-girder type; that of Brugg, remarkable for boldness of design, consists of six double-parabolic (fish-shaped) "Pauli" girders, forming a continuous curve. These particulars may be interesting to engineering leaders at the present time; but the point to which "C. P. S." draws attention is the manner of carrying the permanent way. The rails rest upon the ordinary transverse sleepers, of heavy scantling, it is true, but yet simply resting, in their turn, on the girders; so that between the sleepers not only the rails, but the joints in the rails, are suspended, as it were, over the river.

Providing that the rails or the joints in the rails do not give way, this construction should be sound enough. But in the event of such a failure it is evident that a heavy train would almost surely bring down the bridge. It does not do in railway engineering to be always calculating what might happen, or there would be no railways at all, nor, indeed, any construction, enterprise, or occupation whatever, except the lying wrapped up in cotton-wool to minimise the risk of unforeseen, possible, if improbable, personal injuries; but in the case of these Swiss viaducts there is certainly something left undone to insure ordinary security. Even guard-rails are omitted, excepting at Brugg, and it would only have been natural to fill in between the girders with a solid row of sleepers, with or without a longitudinal sleeper above to receive the rails. Over these bridges pass very heavy goods traffic, and the whole of the International passenger traffic from Basle to Austria *viâ* the Arlberg, and to the Engadine, and *vice versâ*, and it is therefore of vital importance that they should be as sound in design and construction as they can be made. If the Swiss railway authorities are contemplating improvements, they might well regard the matter to which "C. P. S." has drawn attention.

The President of the Board of Trade has issued a circular calling upon the railway companies to give returns that will show the number of cast-iron bridges now in use in Great Britain and Ireland, together with the dates of their construction, &c. In due course the result will be presented to Parliament.

You had quite a good show of competition advertisements last week, and it is noticeable therefrom how the system of announcing assessors' names is coming more into vogue, the first two advertisements stating the names of the assessors proposed to be engaged by the promoters of the competition. This is gratifying in the extreme, considering how, only a few years ago, the assessor was not appointed in one out of a dozen competitions. So far as I regard the matter, as an occasional or "retail" competitor, I like to see the name of the assessor stated at the outset. It may now and then deter one from competing, but as a general rule it encourages one to go in with a good heart. There is such a thing as—there has, indeed, been too much—*pandering to the tastes of the assessor;* but short of this it is to the common advantage of competitors to know that Mr. Dog-tooth or Mr. Egg-and-Tongue has been appointed. Panderers, doubtless, often deceive themselves, as there must be many men who would rather be prejudiced against competitors that they suspected of pandering to their known views on architectural design. My own reason for liking to see the name of the assessor beforehand is that one is prevented from wasting time on a subject of which the assessor may be ignorant. Often architects, unlearned in the design of the class of buildings to which a certain competitor refers, have been appointed assessors; and I can say from experience that it is no joyful news to learn that an assessor has been appointed to judge plans who knows about as much about the special design of the particular building as a milkman knows how to make milk.

The foundation-stone of the Battersea Polytechnic was laid early this week, and Mr. E. W. Mountford had the honour of handing the silver trowel to the Prince of Wales. The honour, all will admit, is well deserved, coming, as it has done, after many "laborious days." Mr. Mountford has come to the fore by simple force of competing, and excellence of work in competitions; and it is just because a successful competition involves such laborious days that we are ready to honour the winner and wish him continued success. The Battersea Polytechnic is one of the series of technical and recreative institutes to be erected in different districts in London, and Mr. Mountford's plan will provide a building in every way suited to its purpose. The object of these institutes or polytechnics is most laudable, and I trust that the others contemplated will be as successfully planned and inaugurated as that at Battersea. Above all, it is to be hoped that the buildings will really effect their purpose, and prove a source of delight to many who at present have no means of obtaining recreation and instruction such as it is intended to provide in these polytechnics.

GOTH.

CHIPS.

Mr. Harry Wilson Perrers, architect, died in Banstead Lunatic Asylum on Sunday, the 12th inst., aged 46 years.

Important works of drainage and sanitary works have just been carried out at the City Freemen's Orphan School, Ferndale-road, Brixton, at a cost of over £2,000. Messrs. Mowlem and Co. were the contractors.

Mr. J. H. E. Partington, portrait painter, and some time principal of the Stockport Art School, also a well-known member of the Manchester Academy, has been appointed director of the National Gallery of Victoria, at Melbourne, at a salary of £600 a year, with free rooms, and the right of private practice.

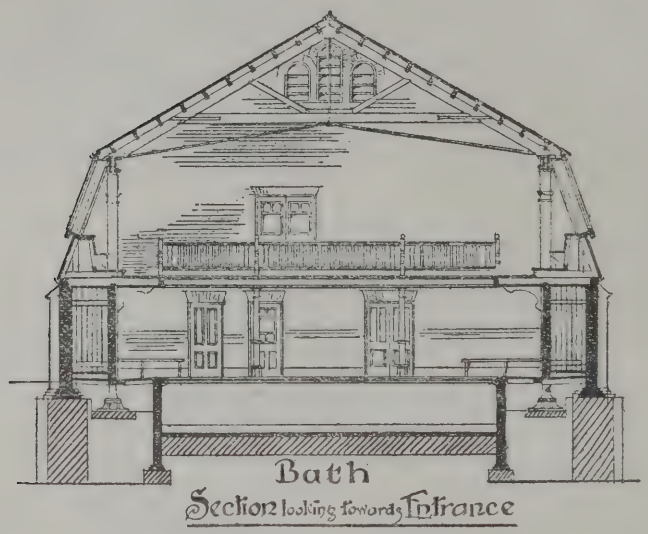
The first section of the Douglas Head Marine Drive having now been completed, the opening took place yesterday (Thursday), when the inaugural ceremony was performed by the Lieutenant-Governor of the Isle of Man, Mr. Spencer Walpole.

A fatal scaffold accident occurred on Monday at Galashiels, whereby one young man, named George Anderson, was killed, and another named Newlands was seriously hurt. They were painting inside the roof of the Volunteer Hall, on a staging 30ft. high. While they were attempting to open a ventilator, the cord broke, and they lost their balance and fell to the floor. Anderson's skull was fractured, and he died shortly afterwards. Newlands was carried home badly hurt.

The Middle Temple Library will be closed during the ensuing long vacation, in order that several alterations to the roof and other parts of the building may be carried out. The alterations are expected to be finished about the end of October.

A large and massive seat and kneeler, carved in English oak, has been placed in Hawarden Church, close by the eagle lectern on the south side of the chancel arch. The miserere seat is sculptured with a representation of the pelican in her piety. Mr. Harry Hems, of Exeter, executed the work.

Supt. Tozer, the chief of the Manchester Fire Brigade, has just patented an invention, of which the principal feature is a movable shutter, sliding between two pillars. The advantages gained by this arrangement are that the horses can be stabled with their heads towards the shutter, thus avoiding turning them in their stalls, and enabling them to be led out at once.



A special meeting of the General Purposes Committee of the County Council for Cornwall was held last week at Truro, to consider an application for a license for the performance of stage plays in the large hall of the new public rooms at Camborne. Mr. Hickes, one of the county surveyors, had declined to grant a certificate for the building on several grounds, he being dissatisfied with the position of the hydrants, with the use of sawdust as pugging for the floor, &c.; but after hearing Mr. Silvanus Trevail, M.S.A., the architect of the hall, on these points, the committee granted the license.

The Runcorn Improvement Commissioners have initiated a proposal to secure the erection of a vehicular bridge to connect Runcorn with Widnes, and the subject has already been considered by the governing bodies of both towns. Sir Douglas Fox has drawn up a scheme that provides for the carrying over the Mersey of a vehicular bridge at a cost of £140,000. It is proposed that the gradients on each side should be 1 in 30, and that the bridge should be constructed at an elevation of 75ft. above high-water mark. This will be 10ft. lower than the elevation of the present railway and foot-bridge. The plan is to build it on the east, or Warrington side, of the present bridge, which it will adjoin.

The highway committee of the Paris Municipal Council has decided in favour of the construction of a subterranean electric tubular tramway from the Bois de Boulogne to the Bois de Vincennes, passing under the Boulevard Diderot, the Rue de Rivoli, the Place de la Concorde, and the Avenue des Champs Elysées.

PRICES.—XI.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

THE STRIKE OF LONDON CARPENTERS.

PROPOSED NEGOTIATIONS.

WE are glad to learn that arrangements have been effected for terminating the deadlock in the building trade of the Metropolis, which has now lasted for three months. The Conciliation Board of the London Chamber of Commerce sent a communication to the Central Master Builders' Association and the United Trades Committee offering their services by way of conciliation, but the suggestion met with no direct response. Mr. S. F. Watts, the secretary of the latter body, however, again approached Mr. Henshaw, secretary of the Master Builders' Association, and after some correspondence it has been arranged that a conference shall take place next week between nine representatives on either side, together with the two secretaries. Mr. Howard J. Colls, the President of the Association, with the eight members who took part in the last conference, will represent the masters; while on behalf of the carpenters, the delegates will be Messrs. Bowern and Dew, representing the Amalgamated Society; Mr. Mackie, of the Associated Society; Mr. Matkin, of the General Union; Mr. Miller, of the Perseverance; and Messrs. Chalmers, F. Cooper, Monk, and Williamson, non-unionists. The conference is arranged to take place at 31, Bedford-street, Covent Garden, at 3 p.m. on Monday afternoon next, when it is to be hoped that an arrangement materially satisfactory to all parties will be arrived at.

The committee for the erection of a memorial at Lisburn to the late Sir Richard Wallace have given the work to Messrs. Robinson and Son, of York-street, Belfast.

On Saturday morning the new dock which has been constructed at the north end of the railway dock at Goole had water let into it for the first time. It is four acres in extent, being 620ft. long, 260ft. broad, and 22ft. deep.

Building Intelligence.

BATTERSEA, S.W.—The foundation-stone of the Polytechnic Institute about to be built on part of the site of the ill-fated Albert Palace was laid on Monday by the Prince of Wales. The architect is Mr. Edward W. Mountford, F.R.I.B.A., whose design was selected in competition on the recommendation of Mr. Rowland Plumbe, F.S.A., and was illustrated in the BUILDING NEWS for March 27 and April 3 of this year (pp. 430, 466, 488, last vol). Mr. Mountford's plans were submitted to the criticism of Professor Garnett, Principal of the Durham College of Science, Newcastle-on-Tyne, at whose suggestion certain alterations were made. The buildings will stand some 40ft. back from the road. In the elevation the aim has been made to give a distinctly collegiate character, consistent with educational purposes. The materials to be used are red brick with terracotta for dressings. There will be a main block with annexes. The main block, fronting the Battersea Park-road, will be 260ft. in length, and two stories in height. The ground floor will be occupied by the administrative department. Upon the first floor will be class and lecture rooms, band and music rooms, and above these will be art schools, photographic rooms, and various laboratories. The shops will include bricklayers' and plumbers' shops, engineers' and turning shops, a pattern-maker's shop, carpenters' shop, electric work-shop, and dynamo, boiler, and engine rooms. There are also to be social and refreshment rooms for both sexes with separate entrances. At the back will be gymnasia and a swimming-bath. Of the £60,000 required all but £9,000 has been raised.

EDINBURGH.—The St. Cuthbert's and Dean School Board have obtained warrant, in the Edinburgh Dean of Guild Court, for the erection of school buildings at Comiston-road. The plans show a two-story structure, providing eight class-rooms and accommodation for 600 pupils, with cloak-rooms, teachers' rooms, and separate playgrounds with sheds for boys and girls. In the centre of the building, which has been so planned that the accommodation may, by an addition, be nearly doubled, provision has been made for a staircase leading to all the class-rooms. The heating will be effected by means of hot-water pipes, and the ventilation is to be carried on mechanically, a fan which will extract the vitiated air being driven by a gas-engine. There is no unnecessary ornament about the front elevation, its prominent features being a central gable and an abundance of windows. The cost of the work, the plans of which have been prepared by Mr. Robert Wilson, architect, 3, Queen-street, Edinburgh, is estimated at £8,900.

LEEDS.—The designs originally prepared by H.M. Office of Works for the General Post Office to be erected on the site of the Old Cloth Hall, were so generally disapproved of as inadequate and unworthy by the press, the architectural profession, and the town council, that amended elevations have now been sent in. The chief alterations are the substitution of Tuscan and Corinthian columns in the chief elevation for pilasters, the introduction of a central turret suggestive of the outline of the Leeds Town Hall on a diminished scale, and the breaking up of the skylines generally. The council of the Leeds and Yorkshire Architectural Society, at a special meeting held on the 16th inst., made the following report on the new design:—"Generally speaking, we consider the amended design a decided improvement upon the one originally submitted. There is a boldness and breadth of treatment displayed in the handling of the architectural features which was lacking in the first design. This improvement, however, does not apply to the design of the central tower, or cupola, which, although of larger size than that originally shown, is feeble in design, and certainly requires further consideration. If it is to be carried out in stone as stated, its architectural features are on too small a scale to harmonise with the proportions of the building below; and if it is to be of woodwork, it would prove much too large for suitable treatment in that material. The changes in the central portion of the principal façade are marked improvements upon the original design, which was much too 'crowded' in effect. Exception may be taken to the range of five dormers above the parapet, over the main cornice, which have a meagre look about them, and would be improved if handled in a bolder and less stiff manner. By the lifting up of the pediments over the fanlights of the principal entrance doorways, these important features are additionally emphasised. Below the cornice, an appearance of solidity is imparted to these portions of the structure by means of piers at the angles of the projections. It is cause for regret that the architect has not arranged for a more suitable position for the letter-boxes than the one indicated. A recessed logia or arcade would appear to u smore worthy of the building."

NORTON.—The contract for the chancel of the new church of St. Peter, Norton, near Leeds, is now completed, and Mr. Robert Wyse, of Auburn Hill, has defrayed the cost of the substantial foundations of the nave. About £2,000 additional is required to finish the nave. The foundation-stone of the new church (which is to be in the Decorated style) was laid in October, 1889, and the original intention was to erect only the chancel, south chapel, &c., and nave, leaving a western tower for future efforts. The estimated cost of the whole work was about £8,000. The first portion of the contract—the chancel, &c., and foundation for nave—was let to Mr. Burton, of Newcastle-on-Tyne, who has now completed his work. The chancel is 37ft. by 25ft., and 52ft. high. When completed the church will seat 700 adults.

CHIPS.

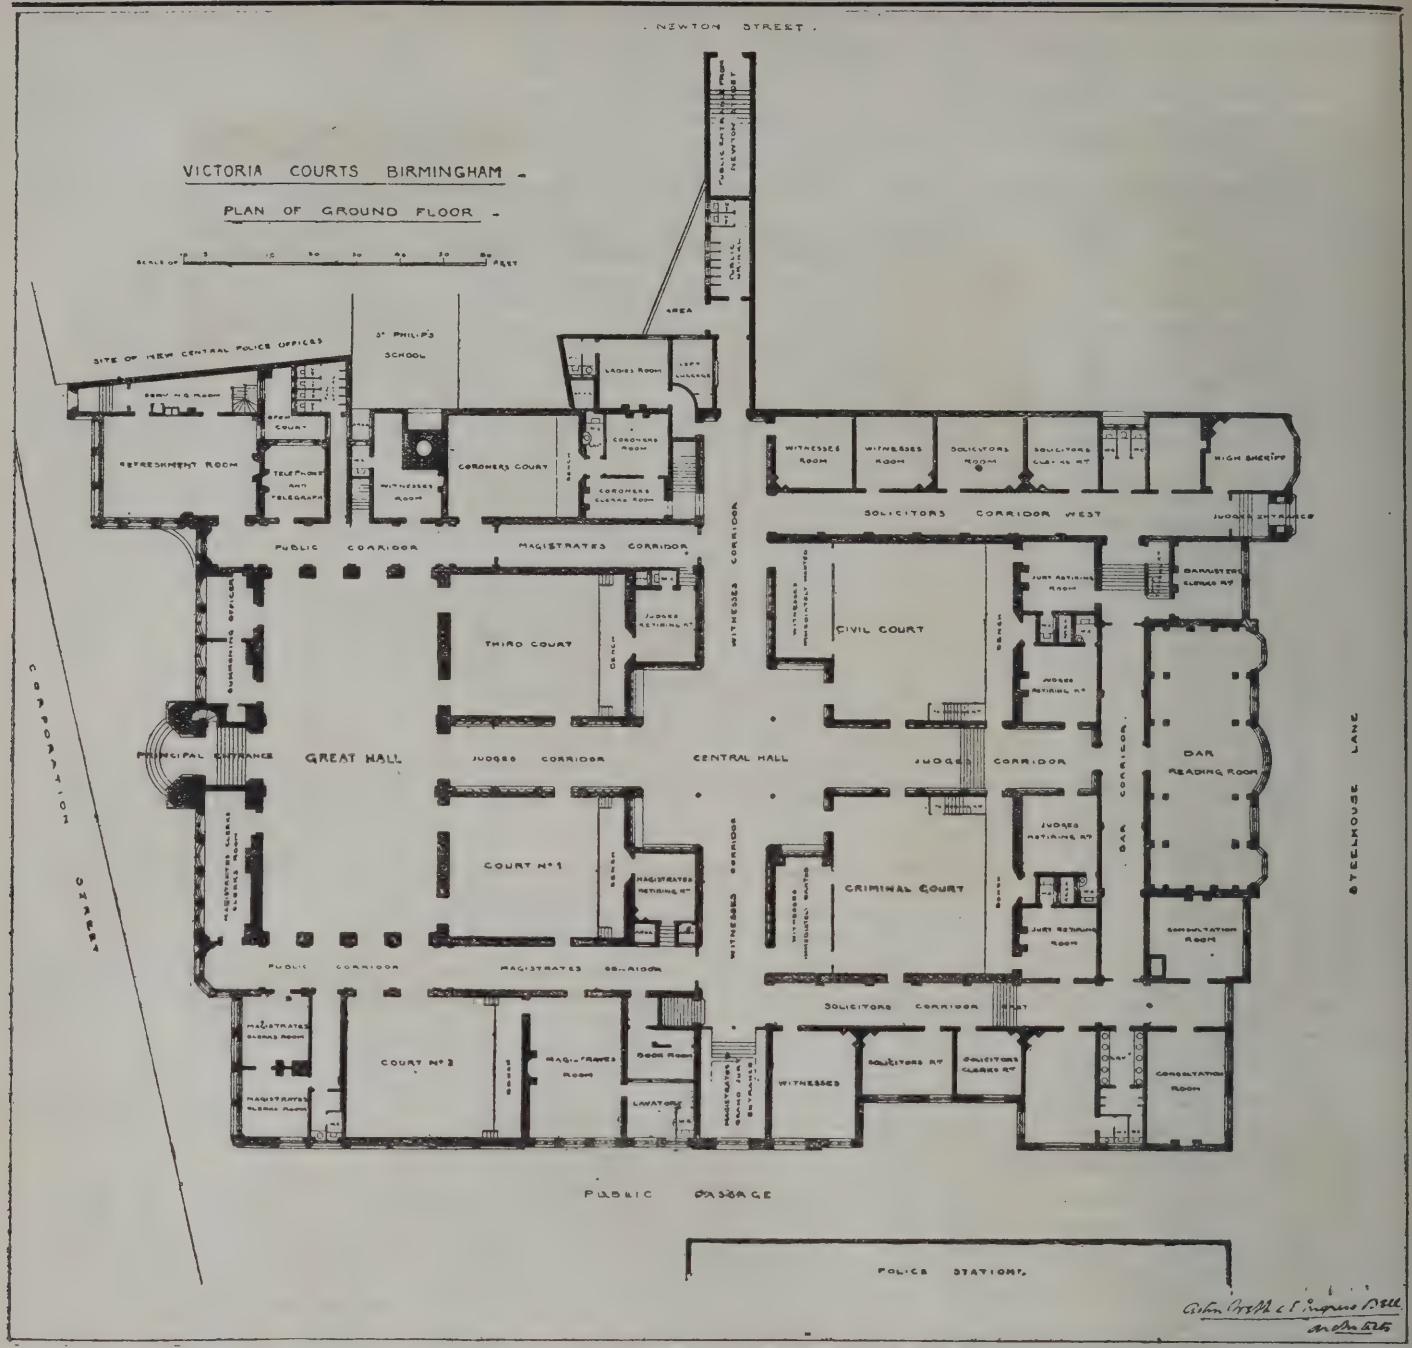
The new town hall for St. Martin's-le-Grand, at the south end of Charing Cross-road, which was opened by Mr. Balfour last week, has been built from the designs of Mr. Robert Walker, of St. Martin's-place, the contractors being Messrs. J. Mowlem and Co., of Pimlico. The chief room on the first floor is seated for 800 persons. The cost of the building has been £24,000, exclusive of fittings.

The annual dinner in connection with the Leicester Master Builders' Association was held at the Bull's Head Hotel, Market-place, on Thursday evening in last week, when the president, Mr. D. Garratt (Clark and Garratt) occupied the chair, and Mr. G. Hewitt (vice-president of the Association) officiated at the other end of the table.

A new Roman Catholic Church has just been commenced at Monaghan. It is Gothic in character, and Mr. Hague, R.H.A., of Dublin, is the architect, and Mr. P. Nolan, of Monaghan, the builder.

At Tuesday's meeting of the streets committee of the Middlesbrough corporation, Alderman Archibald suggested that they should take steps to introduce a clause into the Bill they are about to promote before Parliament compelling builders to leave plenty of space in dwelling-houses. Councillor Brewster quite agreed, remarking that they had had before that committee plans for houses with bedrooms only 5ft. square. Fortunately, the plans had been rejected. Further consideration of the matter was postponed.

The Cottage Hospital, Gartnavel, Glasgow, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.



The Bill for the Demolition of Hanover Chapel, Regent-street, has been referred to a Select Committee of the House of Commons.

In reply to a correspondent who recently wrote to Mr. Chaplin calling his attention to the desirability of planting trees on the waste lands of Great Britain, the president of the Board of Agriculture has replied stating that an inquiry is now being made in the Agricultural Returns for 1891 to ascertain the present extent of woodlands in Great Britain.

The Bristol master builders had their annual outing on Thursday in last week in brilliant weather. Frome was the place visited, and after going to the parish church and to Stourton Tower, the members dined together at the George under the presidency of Mr. E. T. Hatherley, Mr. H. A. Forse occupying the vice-chair.

The premises of Mr. G. Lewis, builder, of Spital-buildings, Queen-street, Cardiff, were destroyed by fire on Wednesday week.

The south-west portion of the Bishop's Palace, adjoining Elgin Cathedral, collapsed on Monday, from a cause at present unknown. The Palace, which is one of the most interesting ruins in the country, was lately handed over by the Dowager Countess of Seafield to the town council of Elgin. The wall has for many years shown evident signs of weakness, and a considerable sum of money was expended by the town council in securing what remained of the old pile by fixing iron bars from wall to wall. The wall, however, fell inwards in a solid mass.

THE VICTORIA COURTS, BIRMINGHAM.

THE Victoria Courts have been built by the Corporation of Birmingham in accordance with an undertaking to provide assize courts when an assize was granted to Birmingham. The building was at first intended to contain the assize courts only, but the scheme grew and it was decided to give up the present police courts in Moor-street, and house them also in the new building. From the commencement, Sir Thomas Martineau, a leading solicitor in Birmingham, actively interested himself in the scheme, with the result that a site in Corporation-street was granted by the council, and with the assistance of Mr. Alfred Waterhouse, R.A., plans were obtained in competition, and those submitted by Messrs. Aston Webb and E. Ingress Bell were finally accepted. We published all the competitive designs in the BUILDING NEWS for August 13, 1886, when we gave a view of the elevation and plans of the chosen design.

The foundation stone was laid by the Queen in her Jubilee year, viz., March, 1887, and the building has been in progress ever since. It comprises two large assize courts (civil and criminal), with reading-room for the Bar, robing-room, consultation-room, and all conveniences, retiring-rooms for the judges and jury, solicitors' and witnesses' rooms. Also a third court, two police courts, and a coroner's court, with the necessary retiring rooms. A great feature in the building, both externally and internally, is the great hall, from which four of the courts open direct, and a very fine apartment, 80ft. by 40ft. In addition, there is a handsome room for the magistrates, a grand jury room on the first floor, and the necessary offices, also a refreshment block with the kitchens over. In the basement, extensive accommodation is provided for the reception and housing of the prisoners in separate cells. The façade of the building in Corporation-street shown in the view is very richly treated in a Free Renaissance, and is constructed entirely of red terracotta, supplied by Mr. J. C. Edwards, of Ruabon. The sculpture in the centre gable bears the Royal Arms, and in the flanking gables emblematic figures by Mr. Aumonier representing the arts and crafts in the trades of Birmingham. The richest portion is the central entrance porch, adorned by a statue of Her Majesty in the gable by Mr. Harry Bates, and four spandrel figures representing the attributes of Justice, designed by Mr. Walter Crane and executed by Mr. Frith. Below the Queen is a group of St. George and the Dragon. The whole building is crowned by a figure of Justice, by Mr. Frith, who also designed and executed the charming little figures on the summits of the turrets. Red terracotta was selected as being the best material for withstanding the atmosphere of Birmingham. Internally, the great hall, the court walls above the panelling, and the corridors are faced with buff terracotta by Messrs. Gibbs and Canning, of Tamworth, and the fittings and wall linings throughout are of oak. The whole of the architectural modelling was admirably carried out by Mr. Aumonier from the architects' designs. The windows of the great hall are filled with painted glass, as a Jubilee Memorial of the City of Birmingham, and were designed by Mr. H. Walter Lonsdale, and executed by Messrs. Heaton, Butler, and Bayne. The internal wood carving was done by Mr. H. Martyn, of Cheltenham. The gates and the metal fittings throughout the interior are Messrs. Hart, Son, and Peard's work. Especial attention has been given to the heating and ventilation. The foul air is extracted from all the courts by means of air-compressed vessels, and are all under separate control; fresh air is admitted into large reservoirs under the court floors, which can be warmed or cooled as required. The courts are also heated by direct radiation from radiators in the courts, while the whole of these complex arrangements are brought under easy control of the engineer in an indicating room, where automatic thermometers also register the temperature of each court. The building is lighted throughout by electricity. The general contractor of the works is Mr. John Bowen, of Balsall Heath, Birmingham, and the furniture has been executed by Messrs. Chamberlain, King, and Jones, from designs by the architects. Happily, throughout the whole of the four years, there has been no fatal accident to any of the men engaged thereon, though, unfortunately, two clerks of works, Mr. Clapp and Mr. Richards, have died. Their successor, Mr. E. W. Nightingale, has seen the building brought to a satisfactory completion. To-day we publish two views of the main corridor leading to the great hall, one view showing the entry in that fine building. The detail sketches show the doors from the lobby to the criminal court, and the entrance to the Bar library. The accompanying plan shows the building arrangements as carried out.

Door's from Lobby to Criminal Court's

Engineering Notes.

SOCIETY OF ENGINEERS.—An interesting visit was made by the members of the Society of Engineers on Wednesday last to the School of Military Engineering at Chatham. Among those present were Mr. W. N. Colam (president), Mr. J. W. Wilson, jun., and Mr. George A. Goodwin (vice-presidents), Mr. Henry Adams, Mr. Charles Gandon and Professor Henry Robinson (past presidents), and Mr. G. A. Pryce Cuxson (secretary). After inspecting the Geological Museum and various relics of the late Major-General C. Gordon, C.B., R.E., the party visited the Schools of Fortification, Surveying, Tactics, Construction, Printing, Lithography and Photography, the Model Sheds, Mechanical Workshops, R. E. Park, Field Works, Siege Batteries, Treble Sling Bridge, and the Submarine Mining Establishment. Experiments in the penetration of the magazine rifle, the arrangement of land mines, the demolition of rails and stockades, and the explosion of submarine mines, specially arranged for the occasion, were witnessed with much interest.

TYNE DOCK.—On Monday, loading operations were commenced at the new coal staiths provided by the North-Eastern Railway Company at Tyne Dock. The new coal staith is some 10ft. higher than any of the others in the dock, so that ships of the largest class can be accommodated alongside. The staith, as well as the sidings and railways leading thereto, have been carried out from the designs and under the supervision of Mr. Charles A. Harrison, the company's engineer, by Mr. John Jackson, contractor; and have been completed considerably within the two years originally contemplated. A large number of men, varying from 400 to 500, have been employed. The cost has been about £70,000. The company are spending a still larger sum upon a new deep-water entrance to the same dock, and this will be completed within a year from this time. The contractors for this are Messrs. Lucas and Aird, of London.

CHIPS.

Among recent purchases in London by Australians are John Linnell's picture of "Bayswater Forty Years Ago," G. D. Leslie's "Duty Towards my Neighbour," and J. C. Hook's "Flotsam and Jetsam," which have been acquired for the National Gallery in Sydney, New South Wales.

Messrs. Benhouse's timber-yard, Whitworth-street, Oxford-street, Manchester, took fire on Saturday morning. The extensive range of workshops and their contents were two-thirds destroyed, the remainder being seriously injured by fire and water. The timber in the yard was also damaged.

On Saturday afternoon, the foundation stone of a church for the new parish of Brinksway-cum-Cheadle Heath, Stockport, was laid. The cost of the vicarage is estimated at £2,000. There will be accommodation in the church for 500 worshippers, and the contract cost of the building is £4,500.

A new link of railway on the South-Eastern system, which will connect the North Kent branch with the proposed important extension of the South-Eastern Railway to Rochester and Chatham, was opened on Monday in the presence of a large number of municipal railway officials.

The polling of the inhabitants of Bethnal-green on the question of the adoption of the Free Libraries Act has resulted in its rejection by 3,098 votes to 2,996. The ratepayers of Hackney have also refused to adopt the Act.

The foundation-stone of additions to Roscoe-place Wesleyan Sunday-school, Leeds, was laid on Saturday. It is being built from designs by Mr. G. F. Danby, of Leeds, from whose plans the main building was erected nine years ago.

The town council of Huddersfield, at their last meeting, appointed Mr. John E. Hughes, of London, for many years manager to Messrs. Lucas and Aird, as superintendent of the new reservoir works in the Wessenden Valley, at a salary of £400 a year.

Messrs. Campbell, Smith, and Company have been intrusted with the redecoration of the Northampton Town Hall.

At St. John the Baptist's R.C. Church, Brighton, a new altar-piece was unveiled. It is a painting, the central figure of which is our Lord enthroned in glory surrounded by angels. The canvas is the work of Mr. Westlake, the designer of the decorations throughout the church. The total cost of the recent alterations, including stained-glass windows and organ, is about £2,000.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., LVII. LVIII., and LIX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

ARCHITECTS' EDUCATION.

To the Editor of the BUILDING NEWS.

SIR,—Much is done, written, and said at the present day respecting the above. Most professions have a certain scholastic course open for young students to pursue and to attain the object of their ambition; but the architectural profession does not appear to have a curriculum of scholastic course for a young boy to follow, and to know that he had attained the proper standard of scholastic education which would make him worthy of the exalted name of an architect and the profession.

Pupils are taken from the elementary, grammar, and collegiate schools, as well as from the universities. To any young aspirant it is very perplexing to know when he has received sufficient education before he leaves school for the tee-square, drawing-board, &c., as he may find soon, or in a few years afterwards (which then cannot be recalled), that he had, to his regret, left school much too soon, and without sufficient knowledge and education to acquit himself honourably in the various phases of his profession and with whom he may come in contact, or that he had wasted valuable and his best time and money aimless in some high school, or to graduate in a university.

Schemes are discussed and formed for the rising generation; but there are now students in many schools that would wish the advice and directions, as well as hear the opinion and experience, of some of our leading architects in a practical and definite form, consistent and in conformity with educational institutions of the country, what standard of education is proper and sufficient, and the best time for a schoo student to enter an architect's office, and whethe it is an advantage or disadvantage to firs graduate in a university and be trained in the pro fession after. Definite information on the sub ject would be highly valuable, as well a interesting to many beside—Yours, &c.,

STUDENT.

HOT-WATER ENGINEERING.

SIR,—In glancing over "Hot-water Engineer ing" in your last issue, p. 65, this evening, find the writer, in the last paragraph of secon column, says:—"From this it will be seen tha a cold supply pipe of $\frac{1}{2}$*in. diameter* brings abou a pressure in a cylinder of $\frac{1}{2}$*lb.* for every 2ft. 4in of its height." As the area or cubic capacity o a pipe is as the *square* of the diameter, the $\frac{1}{2}$in diameter = only $\frac{1}{4}$lb., on the assumption that 1in diameter = 1lb. The circular inch is only ·785 of the square inch.—I am, &c.,

July 21. A. B.

NOT OUR OMISSION.

SIR,—In your list of tenders of the 18th inst for residential flats, Oxford-street, Mr. H. H Collins, F.R.I.B.A., and Professor Baniste Fletcher, F.R.I.B.A., joint architects, our tende of £12,980 was omitted for some reason. Ma we ask you to be good enough to make the re quired correction to the list of tenders?—We are &c., THE CO-OPERATIVE BUILDERS, LIMITED.

Burton-road, Brixton, London, S.W., July 21.

Intercommunication.

QUESTIONS.

[10591.]—**Builder's Book-Keeping.**—Could an of our readers kindly recommend a good system?—Con STANT READER.

[10592.]—**Mural Painting.**—I am just completin the restoration of a manor-house that dates back prior t the Reformation, and in removing a 4½in. brick casin that had bulged outwards a mural painting was discovere on a side wall of a fine old oak staircase; the side i formed of oak studwork filled in between with lath an plaster, on which a representation of Hercules slaying th lion in one panel, and in one above he is seen in the cloud amidst the signs of the Zodiac. To the right of the lowe figure is another panel, with Phedra apparently payin homage to what appears to be a duck. There are als several medallions with birds between other studs. Th work is for the most part skilfully executed, and wa probably done by a member of a religious fraternity t whom the place belonged before the Reformation. should be glad of some reliable information that wil explain the connection of Phedra with Hercules?—W. F. T.

[10593.]—**Chimney-Stack.**—Is a brick chimney stack 3ft. by 2ft. and 15ft. high from the earth of a hipped-roof safe? The situation is exposed, and there i no stay.—SAFETY.

REPLIES.

[10583.]—**Sketching Tour in Yorks or Lincolnshire.** — Ward and Lock's "Bridlington," 1s. should be read up, and places likely to be interesting noted. Traffic Superintendent may be the designation of the N.E.R. official at Leeds or Hull to whom to apply for a list of tours. They supply a book of coupons, to be left at the booking-office and reclaimed on resuming journey, and the user may stop at each station marked on the map of the tour he adopts, if he likes. There are several conditions: one is that, having settled at the outset which way is to be forward, the tourist must go on, and not attempt to double and dodge. The book of tickets being good for a month (or 28 days), leisure for sketching would depend on other circumstances. Buying up photographs, and a longing to fill in items missed another year is the nearest approach to sketching some of us can attain to.—H. W.

[10590.] — **Triforium** may refer to the third condition reckoning horizontally. We know of arcades supporting roof only, also of arcades supporting clerestory only. The meaning of the word need not necessarily refer to vertical subdivisions of the space between the arcade and clerestory, especially when a central mullion is so much more general than any triple arrangement—if such exists.—H. W.

A new organ is being erected in Highfield Church, Southampton, at a cost of £800. Messrs. Walker Brothers, of London, are the builders.

Sir Frederic Burton made two purchases for the National Gallery at the Cavendish-Bentinck sale. One was a picture, "The Fortune-teller," by Longhi, a Venetian master of the 18th century. The other picture is also by a late Venetian—a "Deposition from the Cross," by Tiapolo. The grand total realised by the nine days' sale at Christie's of the collection was £69,549 9s. The high prices obtained were extraordinary. The prime cost has been exceeded by nearly cent. per cent., and in many instances even larger profits have been obtained. Generally speaking, the prices realised show a return of 5 per cent. compound interest on the original outlay.

LEGAL INTELLIGENCE.

JUDGMENT SUMMONSES.—BLOWER V. FRYER.—The plaintiff said the defendant, Mr. Frederick W. Fryer, was an architect and surveyor, and keeping an office in Surrey-street, Strand. He was the proprietor of a building journal, and employed clerks. His Honour made an order of committal for 20 days for the non-payment of the amount of £14 due to the plaintiff.

CLAIM BY A SUB-CONTRACTOR.—At the Dorset Assize, before Mr. Justice Cave, Joseph Dent, a Bournemouth builder, sued Messrs. Joseph Day and Co., a Bath firm, for £68 16s. 7d. for work done and materials supplied. Plaintiffs proved being employed by defendants to do certain work for them in connection with a pumping-station in the Bournemouth Pleasure Grounds, for which Messrs. Day had the contract. Mr. F. E. Lacey, the Bournemouth borough surveyor, gave evidence in support of the claim; he had taxed plaintiff's bill, which was fair and reasonable. Defendants called no witnesses, and the Judge gave a verdict for the full amount claimed and costs.

THE ST. PAUL'S REREDOS CASE.—The House of Lords decided on Monday adversely to the promoters of the suits against the Dean and Chapter of St. Paul's in regard to the legality or otherwise of certain figures on the reredos. The Lord Chancellor said the Statute under which these proceedings were taken conferred upon the Bishop an absolute discretion, from which there was no appeal. The Bishop of London had, in the exercise of that discretion and after considering all the circumstances of the case, decided that no proceedings should be taken. The appeal must, therefore, be dismissed, with costs.

FAILURE OF AN ARCHITECT AND BUILDER.—Eugene Edward Clephan, of Cranbourne-terrace and Norton-road, Stockton, architect, surveyor, and builder, appeared for examination in bankruptcy at the Stockton Bankruptcy Court on July 15. The bankrupt said his gross liabilities amounted to £23,152 3s., of which £10,928 2s. 6d. were unsecured. He estimated his assets at £514 11s. 2d., leaving a deficiency of £10,413 11s. 4d. He succeeded to his father's business in 1868, and then had a capital of about £1,300. In 1886 he compounded with his creditors for 3s. 6d. in the pound, but he did not remember what his liabilities and assets then were. The causes of his present insolvency were losses in trade, depreciation in the value of property, and living at too high a rate. The examination was adjourned.

EMPLOYERS' LIABILITY.—At the Newton Abbot County Court on July 10th, before his Honour Judge Edge, William Charles Pering, carpenter, of 16, Princes-street, Babbacombe, an infant, brought an action under the Employers' Liability Act, through William Alfred Pering, his father, against William Brenton, builder, of Bronshill-crescent, Torquay, for £195 damages for personal injuries caused to him on the 26th March last through the negligence of himself or servants by reason of defects in the condition of a planing machine. The plaintiff, who is about 20 years of age, was in the employ of the defendant as an improver at a salary of 8s. 3d. per week. While attending to newly-introduced machinery, feeding some wood through the steam plane to defendant's father, his right hand was caught, with the result that the two first fingers were taken off and the thumb severely cut.—Mr. John Wright, engineer and proprietor of the Steam Joinery Works, Newton Abbot, said it was absolutely dangerous to work one of the machines without rollers. The jury returned a verdict for £62 8s., with costs, being equal to the average earnings of plaintiff for three years.

RAILWAY STATIONS AND THE BUILDING ACT.—CITY AND SOUTH LONDON RAILWAY COMPANY V. THE LONDON COUNTY COUNCIL.—(Before Lords Justices Lindley, Fry, and Lopes.)—In the Court of Appeal, on Friday, Lords Justices Lindley, Fry, and Lopes gave judgment in this case, which involved the right of the Electric Railway to keep its station at Newington in its present position, part of the building being erected beyond the general line of houses in Kennington Park-road. It was an appeal by the London County Council from a decision of a Divisional Court, allowing an appeal from an order of a magistrate directing the demolition of part of the station. The City and South London Railway Company were empowered by their Acts of 1884 and 1887 to construct an electric railway from King William-street to Stockwell. The company acquired land at the corner of New-street and Kennington Park-road within lines shown in the plans, and constructed thereon two shafts, in one of which was a spiral staircase, and in the other hydraulic lifts afforded access to the underground platforms. Over and adjacent to these shafts the Company erected a station, part of which was erected beyond the general line of buildings, in contravention of the Metropolis Management Act, 1862. The consent of the London County Council was never obtained. The superintending architect of the London County Council certified that the buildings of the Railway Company had been erected beyond the general line of buildings. If the company had acquired certain other lands, as they were entitled to do, adjoining those which they actually acquired, they could have erected a building equally convenient for the purposes of their undertaking within the building line. The magistrate found, as to the necessity and convenience for the company's said building, that a station building at the corner of New-street was necessary and convenient for railway purposes; that the station building, without reference to the provisions of the Act of 1862, was a reasonably convenient building; that it was, however, not necessary for the purposes of the railway that any part of the station buildings should be erected beyond the general line of buildings; and that it was convenient only in that the company saved expense by acquiring less land. The magistrate held that the company were not entitled to build as stated, and ordered the demolition of so much of the building as was beyond the general line of buildings in Kennington Park-road. The company appealed. The Divisional Court (consisting of Mr. Justice A. L. Smith and Mr. Justice Grantham) considered that the provision of the special Act which authorised the company to erect buildings necessary for their undertaking impliedly repealed the general Act, and they accordingly allowed the appeal. From this decision the London County Council appealed. Mr. Lumley Smith, Q.C., and Mr. Cunningham Glen appeared in support of the appeal, and contended that the special Act could be read consistently with the general Act. "Reg. v. Wycombe Railway Company" (L.R. 2, Q.B., 510), "Fenwick v. East London Railway Company" (20, Eq. 544), "Pugh v. Golden Valley Railway Company" (15, Ch.D. 330). The Court unamimously dismissed the appeal.

ARCHITECT OR CLERK OF WORKS.—HORROX V. FAULDER AND CO.—This action for £550 for services rendered was tried at Manchester Assizes on the 16th inst. before Mr. Justice A. L. Smith and a special jury. The plaintiff, Mr. William Horrox, is an architect residing at Stockport, and the defendant company carry on business at Heaton Norris as manufacturers of preserves and marmalades. The plaintiff said that in January, 1890, he was engaged by the defendants as clerk of works in connection with the erection of a jam factory at Heaton Norris, the architect being Mr. Harker. His salary as clerk of the works was fixed at £200 a year. After a time it was arranged that he should take complete supervision of the work, and for doing this he claimed that he was entitled to a commission of 5 per cent. on an expenditure of £15,000, less the £200 he had received in salary. The defendants, he said, promised him fair and reasonable remuneration, and he maintained that a commission of 5 per cent. was a fair and reasonable thing. In cross-examination he denied that he was really engaged as an architect, and that he was to give the company the benefit of all his experience and knowledge. He had occasionally given receipts, he said, for his monthly salary, but he did not admit that these documents precluded him from claiming commission. For the defence it was stated that the plaintiff was engaged as a kind of assistant architect, but he was called clerk of the works because of an agreement he had entered into with his former employers, which might have prevented him from accepting an appointment as an architect for the defendants openly. Mr. Harker acted as the principal architect until the works were finished, and there was no agreement which entitled the plaintiff to a commission, or to any sum beyond his salary. Mr. Lister, as representing the defendants, was asked why they reduced Mr. Harker's commission by £175. In reply, he said that the work was estimated to cost more than was originally contemplated, and that the architect was asked, and consented, to forego any commission upon the extra expenditure. Consideration was also given to the fact that Mr. Harker was relieved of a portion of his work by the plaintiff. The judge pointed out that the plaintiff was described in some of the documents put in as the company's architect, and that he had also certified for work done. In any case, the jury would probably think the amount claimed exorbitant, and agree that from £50 to £130 would be nearer the mark. The jury awarded the plaintiff £150.

EMPLOYERS' LIABILITY ACT.—In the House of Lords, on Tuesday, before the Lord Chancellor and Lords Watson, Bramwell, Herschell, and Morris, the case of Smith v. Charles Baker and Sons was decided. Smith, a navvy, who was injured by the fall of a stone from a crane whilst he was drilling a rock during the construction of the Halifax High Level Railway, obtained a verdict in the Halifax County Court for £100 damages against his employers, Messrs. Baker and Sons. That verdict was affirmed by a Divisional Court, and reversed by the Court of Appeal, on the ground that a person who voluntarily engaged in a dangerous work undertook the risks of it. Lord Bramwell thought as no negligence had been proved, the judgment of the Court of Appeal should stand; but the Lord Chancellor and Lords Watson, Herschell, and Morris were of the contrary opinion, and the original judgment of the County-court Judge was restored.

A SHEFFIELD BUILDER CHARGED WITH DECEIVING THE INSPECTORS.—At Sheffield Town Hall on Monday, before the Stipendiary, a corporation prosecution charged Mr. John Lawrence, builder, of Bristol-road, on two informations laid by Mr. C. F. Wike, the borough surveyor, with having committed a breach of By-law 53a in erecting three houses in Ratcliffe, the habitable rooms in the roof of which said buildings were not at least 8ft. in height from the floor to the ceiling, and not less than one-half the area of such rooms. The second summons charged Mr. Lawrence with a similar offence in respect of three other houses in the same street. Mr. H. Sayer, deputy town clerk, prosecuted, and Mr. A. Neal defended. Mr. Sayer explained that the by-law had been framed so that there should be a proper and fair proportion between the floor space, between the attic or room in the roof, and the roof itself, so that there might be a proper height in every part of the floor. That was to say, they should not have three feet at one part of the room, and have perhaps a bed pushed up close against that wall, which was a very insanitary arrangement. The facts of the case were rather peculiar. Mr. John Lawrence lived in Bristol-road, and is a builder, and in the latter end of 1890 he erected six houses in Radcliffe-road, which is a new road in Sharrow-vale. The houses numbered 37, 39, and 41, formed the houses complained of in the first summons, and 43, 45, and 47 were referred to in the second summons. Notice of completion was sent, and it was found that the by-law referred to had not been complied with. The roofs had been made at the wrong inclination, and Mr. Lawrence came before a sub-committee, and it was arranged that as to numbers 37, 39, and 41 the attics should be closed by filling up the skylights and removing the staircase and making good the apertures. With regard to the other three, it was arranged that the attic should be altered by boarding up a part of the apartments for the purpose of reducing the floor space. These alterations were carried out, and the borough surveyor gave his certificates of completion. In April an inspector was sent to the houses, and he found them all in their original position, as they were before the arrangement. The boarding in the attics had been taken down, the skylights were replaced, and the staircases re-erected. Mr. Neal, for the defence, argued that there was not a tittle of evidence to prove an offence. If there was an offence it must have been committed six months prior to the issue of the summons. There was nothing in this case to show that the offence had been committed within that period. The Stipendiary held there was a clear breach of by-laws committed, and fined the defendant £5 and costs in each case.

PARLIAMENTARY NOTES.

VENTILATION OF THE HOUSE OF COMMONS.—The Select Committee on the ventilation of the Palace at Westminster heard on Monday the evidence of Mr. J. Lunt, who had examined and analysed the air in two committee-rooms. He found that between eleven o'clock and four the quantity of carbonic acid rose from 4·8 per 10,000 parts of air to 8·78; and that the number of bacteria and other organisms rose from 25 to 144. The number of persons present when the room was most crowded was 110. This conditions of things was much better than what was found in many places of amusement, and even in some mechanically-ventilated schools. Some plans for deodorising the sewage in the main sewer of the County Council were submitted to the committee, who have now finished taking evidence, and met yesterday (Thursday) for the consideration of their report. It is believed that they will recommend alterations in the existing apparatus involving an expenditure of about £6,000, their principal suggestions being the enlargement of the air inlets and the provision of gratings and double windows in the committee rooms. The committee are reported to be strongly of opinion that the impurities at present noticeable in the atmosphere come from outside the House.

The City Court of Common Council will proceed, at their meeting on Thursday next, to elect a City surveyor. We understand that, owing to the change in position and emoluments recently made in the office, several of the candidates have withdrawn their applications. It is highly probable that Mr. Andrew Murray, who has been for many years chief assistant to the two last City architects, and by whom the chief work of the post has been carried out, will be appointed.

A new organ, built by Mr. A. Kirkland, of London, at a cost of £300, was opened in Byrkeley-street Chapel, Burton-on-Trent, on the 15th inst.

WATER SUPPLY AND SANITARY MATTERS.

CHARING CROSS.—The Vestry of St. Martin in the Fields are constructing an underground convenience at Charing Cross, immediately adjoining the statue of King Charles the First. The erection will provide 28 urinals, 12 w.c.'s, 2 lavatory basins for men, and for women, 5 w.c.'s and 2 lavatory basins. The usual offices are also provided for caretakers, with storeroom adjoining. The whole of the interior faces are to be lined with ivory-white glazed bricks with special coloured dado, the front walls of w.c.'s being finished with a glazed Doulton-ware cornice. All the woodwork will be of oak, the floors being paved with Rust's vitrified mosaics. Light is obtained by means of Hayward Brothers and Eckstein's prismatic lenses fixed overhead. Through ventilation will be secured by open grids, the main staircases also serving as inlets. An additional means of extraction is provided for in the base of the central gas column. The drainage has a fall of 1 in 30. The general builder's work is being carried out by Messrs. John Allen and Sons, of Kilburn. The ornamental lamp columns are supplied by the Coalbrookdale Company, and the prismatic lights by Messrs. Hayward Brothers and Eckstein. The whole of the sanitary fittings are being supplied by Messrs. Doulton and Co., of Lambeth. The w.c.'s will be fitted with Doulton's Simplicitas washdown pedestal closet, flushed by Doulton's three-gallon Paisley valveless siphon flushing cistern. A special feature is made of the urinals by providing an open, semicircular-backed urinal, in one piece of strong, white, enamelled pottery, with highly-glazed gutter to match, there being no basin or attachment whatever. St. Anne's marble is used for finishing the backs, divisions, and capping. Automatic tanks of St. Anne's marble, with plate-glass fronts and internal fittings of polished copper, will supply the flush to the urinals. Lavatory basins will also be provided for both departments. The cost of the works will be £4,065. The structure has been designed by Mr. Chas. Mason, Assoc.M.Inst.C.E., the surveyor to the vestry, under whose supervision the works are being carried out, Mr. W. Meats acting as clerk of works.

CARSHALTON.—An inquiry has just been held at Carshalton by Mr. Samuel Joseph Smith, C.E., one of the inspectors of the Local Government Board, into a proposal of the Carshalton local board to borrow £25,000 for works of sewerage and sewage disposal. The scheme was opposed by an influential committee of ratepayers. The chairman of the committee (Mr. J. W. F. B. Taylor, lord of the manor), and the hon. sec. (Mr. E. H. Bourchier) were present. Mr. Barnard Lailey, instructed by Messrs. Cave and Co., of 4, Fenchurch-street, E.C., appeared to oppose the scheme. Evidence in support of the scheme having been given by Mr. Heward, the surveyor to the local board, and Mr. Bruges, C.E., Mr. Urban Smith, C.E. stated that a gravitation scheme was possible, and that the costly pumping works proposed were unnecessary. The report of the inspector will be issued in due course.

OUNDLE WATERWORKS.—The Local Government Board have given their sanction to a scheme for the water-supply of Oundle, prepared by Mr. W. H. Radford, C.E., of Nottingham. The decision as to the sewerage scheme is expected shortly.

VYRNWY WATER FOR LIVERPOOL.—A supply of water reached Liverpool from Lake Vyrnwy for the first time on Friday. The works have been exactly ten years in course of construction, for the first stone of the works was laid by the late Earl Powis on July 18, 1881. Even now the permanent tunnel under the Mersey at Fiddler's Ferry has to be driven, the supply being through a temporary pipe laid on the river bed. The original estimate for the scheme was £1,502,094, but the actual cost will be about 2¼ millions. Mr. G. F. Deacon has been the engineer-in-chief.

A new surgical wing, which has been added to the National Hospital for the Paralysed and Epileptic in Queen-square, was opened by the Duke of Westminster on Saturday. Mr. Henry Currey was the architect of the wing, which raises the number of beds in the institution from 170 to 190.

The death occurred on Sunday week, at the age of 76, of Mr. William Baker, late sanitary inspector and superintendent of works for the Borough of Stafford. Mr. Baker was first appointed, over 14 years ago, manager of works, and subsequently sanitary inspector. For many years Mr. Baker was employed in carrying out important railway and other works. Under the late Mr. Brassey, he was engaged in the construction of the Trent Valley Railway. The cutting of the Caledonian Canal, the laying out of Sefton Park, Liverpool, the construction of reservoirs of importance were amongst the numerous great works in which he participated.

Our Office Table.

As might have been expected, the equal division of the Royal Commissions on Westminster Abbey on the best side for the proposed mortuary chapel has given rise to a warm newspaper controversy. Sir Henry Layard set the ball rolling by a letter in the *Times*, in which he vehemently protested against the adoption of the Refectory site. Mr. Alfred Waterhouse, R.A., has replied, pointing out that the alternative site, the space south of the Chapel of Henry VII. could only be approached from the Abbey by a cloister awkwardly threading its way between the flying buttresses of the Chapter House, and would shut out for ever from view the lower portions of that building, whereas the way to the Refectory site from the Abbey is already made, and is one of the most noble and beautiful that can be conceived—the west walk of the cloisters. While on the Refectory, we should have, Mr. Waterhouse contends, "a structure which would not alter the present outward appearance of the Abbey nor the ancient plan of the monastery in the slightest, which we should not see at all until we were beneath its vaulting. On the south-east site we should have a building we might well be proud of, but which would add a new feature to the exterior of the Abbey, and would be a serious competitor with Henry VII.'s Chapel itself." Both schemes have, he admits, their merits, and he hopes that a want of unanimity on the part of the Commissioners will not prevent one or other of them being speedily adopted.

SIR WILLIAM FETTES DOUGLAS, LL.D., the President of the Royal Scottish Academy, died at Newburgh, on Tuesday, from the effects of a chill taken while sketching on Tayside. He was born in March, 1822, his father, a bank accountant, being an excellent amateur water-colour artist, and the son, after ten years' service in a bank, devoted himself to art. He had no academic learning, his knowledge of painting being, for the most part, self-acquired. When twenty-one years of age, his first works were exhibited at the R.S.A., and from that time forward he became a constant exhibitor there, first with *genre* subjects, and latterly with water-colour landscapes. Recognition of his powers was marked and rapid at the Scottish Academy. Elected an Associate in 1851, he became an Academician three years later, served as secretary in 1869-70, and became President in 1882, on the death of Sir Daniel Macnee, when he was knighted. From 1877 till 1882 he acted as curator of the Scottish National Gallery. He rarely exhibited at Burlington House. Sir W. F. Douglas was a man of various accomplishments, a sound antiquarian, and a good linguist. He wrote little or nothing on art, but his addresses and speeches were original and racy. His portrait, painted in 1883 by Mr. G. Reid, R.S.A., and presented to the Academy, hangs in the library of that body.

THE Leicester Borough Extension Act of 1891 has now received the Royal assent, and it comprises added areas to the extent of 5,504 acres, and an additional population of nearly 33,000, being the populated parts of eight surrounding parishes and the whole of the Belgrave Local Board district. The total area of the extended borough will be 8,534 acres, and the population about 175,000. The whole of the powers in the Bill have been obtained, which include poor-law administration, registration of births and deaths, &c. Mr. E. G. Mawbey, C.E., the borough surveyor, as engineer, has been one of the chief workers in the preparation and promotion of the extension scheme. The corporation take over the added areas on the 31st of October next, and they have undeataken to carry out within two years the storm outfall drainage scheme, which has recently been prepared by the borough surveyor and adopted by the council, at an estimated cost of £71,000. Also to efficiently deal with their sewage within six months, and to dredge the river Soar within the limits of the added area in twelve months from the passing of the Act.

THE site of the Church of St. Olave, Old Jewry, was offered by auction by Messrs. Edwin Fox and Bousfield, acting under the orders of the Ecclesiastical Commissioners for England, on Wednesday, at the Auction Mart, Tokenhouse-yard. The sale particulars stated that the site was freehold, and covered an area of 2,630 superficial feet, with a frontage to the Old Jewry of 39ft., and extending to a depth of 62ft., of which a small part was required by the Corporation for widening the street and court at the side. The remainder of the site of the church was reserved, under the Order in Council by which the union of the benefice with St. Margaret's was accomplished, for the erection of a rectory-house for the united parishes. The biddings began at £15,000, and advanced slowly up to £22,400, at which the property was sold. The church, now to give place to City offices, is one of the least interesting of Wren's edifices. All the fittings and monuments, including a bust by Nollekens of Alderman Boydell, the fine-art publisher, were removed four years ago to St. Margaret's Church, Lothbury.

LONDONERS have become familiarised during the last ten or twelve years with steam derricks, by which the work of erection of lofty buildings is greatly expedited, and the employment of scaffolding proportionately reduced. In a gigantic block of offices now in progress at Denver, Col., for the Equitable Insurance Co. of New York, the idea is pushed a step further, so as to economise time, labour, and the use of temporary plant more fully. The building in question will cost about £300,000 sterling, and will be the most expensive edifice west of Chicago. The dimensions are 125ft. by 400ft.; the time allowed for completion is very short, as it must be opened on April 1st, 1892. Messrs. Andrews, Jaques, and Rantoul, of Boston and Denver, are the architects, Mr. William M. Scanlon being the manager of construction, and for the work of erection a corporation has been specially organised under the title of the Denver Equitable Building Company. When the work had been set out, six Norcross derricks were erected on the site just within the outer line of the building, and having booms long enough to extend 25ft. beyond the walls on each side, the whole being capable of covering the entire plot. These derricks are mounted on heavy trestle work which raise them 42ft. above the cellar floor, and the booms are so high that it will be unnecessary to remove the derricks before the fifth story is reached. The masts of the derricks are of Oregon pine, 16in. square, and 75ft. long, and the booms are each composed of two pieces of Oregon pine, 16in. by 18in., and 52ft. long. The back stays are of Norway iron, 1in. 6in., and the iron suspension rods extending from the tops of the masts to the booms are of 2in. round iron. The booms are, as usual, each provided with a trolley, by means of which the material may be carried to a horizontal direction, and the derrick and trolley are turned in the customary manner by men who stand on platforms on the masts. The hoisting cables extend to the engine-house, which contains six hoisting engines, one for each derrick, each engine being 40H.P., with a capacity of 7,000lb. for rope. Each engine is fitted with an electric call bell and indicator for signalling purposes. The first two stories of the building are to be faced with Colorado granite, and the upper portion with brickwork. The interior construction will be of steel beams and fireproof tile arches.

A VALUABLE report has been laid before Parliament by Sir Henry Roscoe, M.P., in which he gives the results of some experiments made by him with regard to the possibility of freeing the air supply of the debating chamber of the House of Commons, not from particles of dust and fog, which has already been accomplished, but from the floating germs which are constantly present in the air. The results of the experiments as a whole proved that the filtration of the air on a large scale could practically remove all the floating aërial germs. Hesse's method, by which the air is drawn through a long tube coated internally with sterilised gelatine, gave the best results in filtration. The effect of filtration upon the air within the chamber itself has yet to be ascertained, and it would be interesting to continue the experiments from that point of view.

THE members of the local board of Penmaenmawr are as cautious as Scotchmen in expending the ratepayers' money. At their last meeting the question arose of the buildings to be erected at the new cemetery, and they decided to offer the magnificent premium of £3 "for the best design for a cemetery chapel to hold 150 people." It was not determined whether this tempting prize shall merge in the architect's

commission, or whether the clerk to the local board shall pay it over in a lump sum or by instalments to the fortunate competitor. Certainly the members of the Penmaenmawr Local Board are liberal folk.

It is stated in the Parliamentary Report on the British Museum just issued that the trustees have urged on the First Commissioner of Works the desirability of extending the northern boundary line of the grounds of the Natural History Museum at South Kensington, so as to admit of the future development of the building, by securing to the Museum some portion of the land, situated between the Imperial Institute-road and the present boundary, recently acquired by the Government from the Commissioners of the Exhibition of 1851, and they have been assured that full consideration will be given to their views before a final appropriation is made of the land in question.

The chief donations to the British Museum at Bloomsbury last year included—from Lord Savile, an archaic terracotta antefix, from Lanuvium; from the Earl of Derby, a series of stone and flint implements from Denmark, &c.; from the Earl of Lonsdale, a large ethnographical collection from North-West and Arctic America; from the Hon. Robert Meade, choice specimens of Chinese egg-shell and other porcelain; from Lady Charlotte Schreiber, watches and mediæval antiquities; and from Mr. A. W. Franks, specimens of porcelain of different countries, in augmentation of the Franks collection, and various antiquities. The past year at the library has been remarkable for acquisitions of celebrated Bibles, including the Egenolff German Bible, Frankfort, 1534, of great rarity. An important series of antiquities has been purchased from the Earl of Carlisle; the collection of engraved gems, which forms the most important part of the purchase, was made by Henry Howard, fourth Earl of Carlisle (1694-1758). According to the report of Mr. A. W. Franks and Mr. A. S. Murray, the collection is of importance, not only on account of its fine cameos and intaglios of undoubted authenticity, but also because it contains several specimens with reputed artists' signatures which have been the subject of controversy among archæologists.

During the past week the valuable series of tiles, found during the late excavations in the churchyard of Kenilworth, the site of the famous Priory, have been placed in a permanent position for security. While the work was in progress the tiles were carefully removed to the old "Tantarra," where they have since remained. At the suggestion of Mr. T. W. Whitely, architect, of Coventry, and with the consent of the vicar and churchwardens, they have now been securely fixed by Messrs. E. Smith and Son, of Kenilworth, in the walls of the entrance porch, in close proximity to the Norman arch for which the church is celebrated. Owing to the variety of floral, geometric, and heraldic designs embossed on the tiles, no system or pattern could be followed in fixing them on the walls, to which they form a unique dado. The top row is bordered by a beading, and on the south wall a polished brass plate will be placed with an inscription stating where they were found, and the date of their discovery. In their present position they will be easily accessible to visitors, and will be secure from pillage on the part of relic-hunters.

At Sheffield, on Wednesday night, a steeplejack named Gilbert met with a shocking death. He was engaged in repairing the steeple of St. Matthew's Church, Carver-street, and while clinging to the weathercock it gave way, and he fell from a height of 150ft. into the street. Death was immediate. The accident was witnessed by crowds of people who were watching.

A working bricklayer of Chelmsford, named George Mead, and his two sons, who are also bricklayers, have received an intimation that they have become entitled to property, valued at about £8,000, left by a brother of George Mead, who recently died in Australia. He went to Australia many years ago, and amassed a small fortune as an hotel proprietor.

St. Mary's, Wolverhampton, was reopened after interior restoration last week. The woodwork has been re-decorated by Messrs. Lewis and Swindley, of Wolverhampton, the organ has been improved by Messrs. Nicholson and Lord, of Walsall, and a new mosaic floor laid in the chancel by Messrs. Maw and Co., of Jackfield, Shropshire.

Trade News.

WAGES MOVEMENTS.

Greenock.—The masons of Greenock have received an advance of ½d. per hour, which brings the rate of wages up to 8d. By agreement between the masters and men that rate of wages will continue for a year.

St. Helen's, Lancs.—A hitch occurred as to the choice of an arbitrator between the masters and men, but the Mayor has been accepted by both sides in that capacity, and on Monday afternoon heard deputations of both masters and men. His decision has not yet been announced.

CHIPS.

The old Custom-House in Greenmarket, Dundee, a fine example of the architecture of the 16th century, is at present being demolished by the Police Commissioners of that city. The demolition is rendered necessary in consequence of the building being in the line of the new street to be named Whitehall-crescent.

On Sunday last a new clock was started at Astley Bridge Church, Bolton, by the donor, Mrs. John Ashworth, in the tower of the church. It strikes the hours, chimes the Westminster quarters, and shows time on three dials. It will prove a great boon to the inhabitants, and will form a standard for the timekeeping of the neighbourhood. Messrs. John Smith and Son, Midland Clock Works, Derby, carried out the work, and they have also just completed a large clock on the Victoria Pier, Douglas, Isle of Man.

Holloway's Pills never prove delusive, or give merely temporary relief, but attack all ailments of the stomach, lungs, heart, head, and bowels in the only safe and legitimate way, by cleansing the blood, and so eradicating those impurities which are the source and constituent of almost every disease.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1908.

FRIDAY, JULY 31, 1891.

LEGISLATION AFFECTING BUILDING.

SEVERAL Bills have been lately proposed and passed by the London County Council which will have an important bearing upon street improvements and building operations in the Metropolis. There was certainly much room for improvement; the administration of the old law did not always work smoothly; a considerable number of anomalies in matters of local management took place; the interpretations of the existing building laws by the Courts gave rise to many contradictory decisions which materially weakened the hands of the authorities. The clauses introduced in the London Council (General Powers) Bill of last session we referred to briefly last week. Of these the most important in their bearing upon buildings in London are Sections 28, 31, 33, and 36. To take one instance of the narrow restriction of the Building Act, its complete ignoring of all new or improved materials for building. The Council practically, under the old Act, had no power of making by-laws for sanitary objects, nor with regard to plastering, the materials for which could be almost anything. They were powerless also to insist upon the construction of impervious outer walls for basements. The amended draft by-laws under Section 16 of the Metropolis Management and Building Acts Amendment Act, 1878, give larger powers to the Council as to the foundations and construction of walls, and practically they give consent to the employment of materials which, under the old rules, were regarded with some suspicion, if not with disfavour. The materials used for damp-courses may, for instance, be any that are approved by the district surveyor. The concrete is prescribed in its ingredients and proportions. Many of the improvements in the by-laws have been suggested by the Surveyors' Institution, the Institute of British Architects, the District Surveyors' Association, and others. Again, under Section 31 of the General Powers Act, it is provided that for plastering, sound laths free from sap and freshly-burned lime and clean sharp sand must be used. At the same time the by-law does not exclude new and approved materials. Iron and incombustible laths or wire netting may be used instead of wood laths; and for cement, Portland, Keene's, parian, Martin's, selenitic, or other approved cement or plaster can be employed. Again, it is permitted to use fibrous material to the satisfaction of the district surveyor, instead of hair, and ground bricks, or furnace slag instead of sand. This last is one of the amendments to the former draft which we have already given. For ceilings or partitions, fibrous or other slab plastering can be used with the district surveyor's approval.

As to corner buildings with frontages in two streets, it has always been a difficult question to decide which frontage line ought to be complied with, but the decisions of the Court have generally held that a corner building can be in two streets, and, therefore, a side street is considered as much as a main street. This ruling was that in the case of "Barlow v. Kensington Vestry," and was also that of De Vere Gardens in the Court of Appeal. Section 33 will finally settle the question, as the Council are now empowered to control the main and side frontage of buildings in streets hereafter to be formed. An equally important section will prevent the erection of buildings of an excessive height, the Council having the power in their own hands to give their sanction or not to any erection of this class. The effect of this enactment will, of course, be to limit expenditure on a certain area, and thus to a certain extent to limit the architect's commission, and perhaps that is one reason why some of the profession have not given their support to the clause. If so, it is a very near-sighted and narrow policy.

But the legislation of the past year has done much to promote architectural activity and progress, besides amending building laws. Bills like the London Streets Improvement Bill, by widening important thoroughfares, will give opportunity for rebuilding on a scale that has seldom been afforded. For example, the proposed street from the Strand to Holborn, brought before the London County Council, will open some very valuable frontages for building. We do not altogether approve of the straightness of the line of the new street, which commences at the south end opposite Wellington-street, having its opening at the corner of Catherine-street and the Strand, and taking a straight line to High Holborn opposite Southampton-row. The route will cut obliquely through Drury-lane, Kemble-street, Great Queen-street, and absorb almost entirely Little Queen-street at its north end. Probably the line adopted will be the least costly—at any rate, important frontages will be made for new buildings, and not a few of the sites will suggest themselves for theatres. For the purpose of recoupment, adjoining property is often bought in addition to that absolutely required to make a new street; but in this case the committee have abandoned this idea, as they have found it unremunerative in other instances. For architectural reasons this is a pity, as many of the triangular corner-plots intersected by the new street would be valuable for public buildings or for letting under the control of the Council. The southern approach to the Tower Bridge is another opportunity that will soon be afforded for the remodelling of old premises. The improvements contemplated at the corner of Tottenham Court-road and at Wandsworth-road, Battersea Park, and York-road are all of importance if we look at the possibilities which these schemes suggest. Unhappily, however, experience in public so-called improvements has not been favourable. Commercial speculators and builders have filled up sites with blocks of offices and shops, over which no control has been exercised in their elevations, and the general appearance of a new street till age has toned it into harmony with its surroundings is one of disappointment or disgust. The mode of levying rates and the amount of compensation are points which the Council have considered in these schemes. One of the principles was that known as the "betterment" principle, by which the rates are levied in a higher degree upon property which will derive benefit from the improvement; but the provisions for this purpose were struck out of the Bill. Another and no less important principle which has been incorporated in the Bill is that, in a question of disputed compensation, the arbitrator shall not award any sum of money for any improvement, alteration, or building which has been made or erected with the object of increasing the compensation, so that owners of property will be prevented from trying to take advantage of their position by resorting to means of increasing their compensation or purchase money. We have heard of many flagrant instances of making money by these subterfuges, which public authorities, in the interests of the ratepayers, ought to check.

A Bill to consolidate the law relating to theatres, music-halls, and other like buildings has been framed and read a first time in the House of Commons which, if it does not meet with the opposition from lessees of theatres, will greatly strengthen the hands of the authorities in seeing that buildings of structural convenience and safety against panic and fire shall be erected in the future. The piecemeal and very disjointed provisions of the law as it now stands have enabled buildings of a very unsatisfactory character to be erected. The recent rules and by-laws that have been put into operation have only partially remedied the evils of insufficient and narrow exits and improperly-constructed corridors and staircases. We have on a former occasion discussed the provisions of the Public Health (London) Consolidation Bill. It is needless to say how great a boon this will be to both the sanitary authorities and the public, who are at present defied by those who revel in the uncertainties of the statutes, and take advantage of conflicting authorities.

Architects and all those who desire to stop the mania for disfigurements and modes of advertising in the streets will be glad to hear of two "private" Bills promoted this year, one dealing with overhead wires, and the other with sky-signs. Wires and hanging advertisements are rapidly increasing in London and our large towns; the least desirable encroachment is the sky-sign, which materially interferes with the contours or sky-lines of our public buildings to which they happen to be in proximity. The danger of sky-signs that have been badly fixed or neglected is one of the strong reasons for a measure to prohibit or control the erection of these disfigurements. The Bill has passed the Select Committee of the House of Commons, and we understand it has been generally approved. At no previous time probably have so many Bills affecting buildings been promoted, or, in the case of public Bills, watched; and the profesion would do wisely to take notice of them. The proposals of subway railway companies, as that of the Central London Railway, are likely to affect, whenever they become law, many rights and interests. As the freehold in the subsoil is vested in the owner of the land, it is necessary to exercise some care in the preparation of plans for railways, gas and electric-lighting works, as claims are constantly being made by the freeholder for compensation or purchase money. In the opinion of many, the insertion of clauses giving power to owners of land adjoining a line of proposed railway to claim payment for the ground under the surface ought to be opposed, as such clauses would establish a precedent prejudicial to the interests of the public. In the case of the Central London line, which has passed the third reading in both Houses, the clause which gave power to the railway company to take the subsoil without compensation was struck out, so that they are liable to payment of compensation to the freeholders. The question is one requiring consideration by both promoters of such works and owners of property.

NATIONAL COMPETITION PRIZE DESIGNS AND DRAWINGS.

THE annual competition of Schools of Science and Art held at South Kensington is, on the whole, a fairly representative display. The works sent up for examination number 48,636 from Schools of Art and branch schools, 40,335 from art classes, and 43,246 from science schools, and of these 2,015 works were selected for competition. The drawings in the galleries comprise only works for which medals and prizes of books have been awarded, and even some of those, from want of space, have not been hung. Six gold medals, 74 silver medals, 138 bronze medals, and 254 book prizes have been awarded, in addition to the honorary awards to students of the training class. Birmingham, Canterbury, Edinburgh, Glasgow, Manchester, and South Kensington

represent schools which receive gold medals, and Birmingham, Dublin, Leicester, Sheffield, and Manchester are large recipients of silver and bronze medals. But these awards do not invariably indicate the progress or success of various schools, or the development of art in this country. They only represent the few individual geniuses, by no means the steady progress made. We rather look to the bronze and book prizes as the most representative mark of the work done in the schools.

We now confine our attention to the architectural designs and drawings, and to some of the designs for metal work, hangings, mosaics, and textiles. No student of architectural design has been deemed worthy of receiving a gold medal. Charles R. McIntosh, Glasgow, is awarded a silver medal for a design for a public-hall, Greek Ionic in design. The order rests on a plain basement, and the general design and details are refined and well drawn; but the practical utility of such a building may be questioned. As an academic study for the Alex. Thomson Travelling Studentship, it has merit. The perspective is shaded in ink. A design for a science and art museum, with centre pavilion and ends, has much Greek feeling, and is neatly drawn; a clever section is shown. Another silver medal is given to James H. Tonge, York, for a design for a cathedral church of cruciform plan, with central tower and spire, or lantern. The design is rather too fanciful in some of its features; but without a plan it cannot be critically examined. Why is this important part of the design not hung? The sections are sketchily drawn, but not sufficient to indicate construction, as of the octagon lantern or spire. Imaginative and fanciful in some of the features, there is evidence of no mean architectural skill and taste in the composition and drawing. A silver medal is also given to Heber Rimmer, Chester, for a design of a country church, which exhibits some taste and feeling in the treatment. The plan has a nave, chancel, and aisles. There is a west tower of good proportion, with low pyramidal tile roof and angle buttresses. The nave is five bays long, and the style is Late Perpendicular, with exceedingly massive buttresses. The red tile roof contrasts with the stone walling, and the drawing is boldly tinted. Priestly B. Shires, of Plymouth, obtains the same prize for a design for technical college. The plan, a rectangle, is fairly well disposed, with lecture theatres for applied mechanics and chemistry on each side of entrance, having workshops and yard entrance in the rear. The principal staircase is meagre, and the corridors are lighted by a very small area. The design is a solidly-treated Italian building with two stories and orders, pavilions at corners, having heavy domical roofs, with central cupola. The drawing is bold, but the proportions and outline not happy. One of the cleverest and most artistic designs is by Albert C. Breden, of the People's Palace Science Class, for a town hall, shown by a nice sketch in sepia. The features are of Renaissance character, and the hall and wings well grouped. The offices are on the ground floor, and hall above; the entrance hall is not well lighted. It takes a silver medal. George S. Hill, Glasgow, is awarded a silver medal for an Early Classic hall, a large, domical building, with four porticoes, and of Greek design. The dome has a crushing and overpowering effect. The drawing is well executed, and a good perspective accompanies the design. Bronze medals have been awarded to George S. Hill, Glasgow, for a public school design, a Classic-treated building, with tower; to E. Clarke, Birmingham, for a design for cathedral, in which the student's imagination has run wild; and to J. Hall, York, for a country house in Late Gothic; to Ernest R. Davis, Leicester, for a fairly-drawn design for a small church, of stone, but of poor detail, in Late Perpendicular, and with a very small chancel; to W. Eaton, of the same town, for a clever design for public baths. Charles N. Holloway, Nottingham, receives also this prize for a design for municipal buildings, Renaissance in design, with high roof of two orders of pilasters and corner towers. W. C. Gregory, of the same town, receives a medal for a design for law courts, a building of three stories, Italian, with angle towers, and rather poor in proportion and fenestral treatment. A. Spain, of Sydney, receives a bronze medal for a Classic design of poor proportions and plan. Bronze medals are also given to J. H. James, Cardiff, for a cathedral, cruciform and Geometrical in style; to George Gunn, Glasgow, for a clever study of a Volunteer drill-hall, Classic, and nice in the design and grouping of the tower; to H. Mitchell, Glasgow, for a design for a staircase to town mansion, well drawn, but ill-studied and pretentious; and to Howard Riddett, Leicester, for a village club, a nicely-tinted sketch, but with tracery and details of bad design and drawing. Book prizes are given to G. Lawrance, Bristol, for a design for a small church, brick, in Early English style, with octagonal centre tower, neatly drawn. With the exception of the design for cathedral, there is evident a more moderate class of subjects given for competition. Ambitious designing is better restrained, and provincial schools like those of Birmingham would do wisely to give buildings of more every-day requirements.

Referring to the designs in Stage 23c, we must mention the few exhibited drawings of wrought ironwork. The work is of less merit than we have seen before, and the examiners seem to have thought so too. A. Clarkson, Leicester, takes a bronze medal for panels of simple design, though rather poor; and the same prize is given for wrought-iron gates with centre panels, friezes, and rails of sheet iron. Amy Hobson, Sheffield, wins the silver medal for a design for coronet and bells for the Holy Scroll of the Law. There is much elegance in the outline, which is Persian in style. The daggers and sheaths by W. P. Belk, also of Sheffield, are delicate and graceful in design, and all artistically drawn. These also win a silver medal. Book prizes are won also by a "filling" of grille and panel—but the nature of design is not clear; and also for a wrought-iron bracket, wanting in adaptation and elegance.

The designs for mosaics, wall-papers, and decorations are good, and creditable to the authors. The Canterbury School, in the person of Gertrude Roots, has the fortune to win a gold medal for a design for mosaic of geometrical interlacing character. The colours, in blue and brown, are bright, harmonious, and delicate. Animal forms are introduced in the fillings made by the rather elaborate arrangements of interlaced octagons, circles, and star-like forms. Another lady of the same school, Mary K. Curtis, takes a silver medal for a mosaic pavement of a star pattern, subdued in colour, but with small repeating tesseræ, which gives the design a crowded effect. Amongst designs for tiles is one by Geo. Austin (Manchester), an interlaced arrangement with animals—ingenious, but rather crowded—awarded a silver medal; Evelyn D. Foster (Hertford) has a mosaic floor decoration—a clever, bright arrangement of intersecting forms in blue and delicate green. The urn-like intersections somewhat spoil the effect. A square repeat is shown. This design is also awarded a silver medal.

Other tile designs comprise a silver medal design by Lindsay P. Butterfield for printed tiles of boldly-arranged stem lines through repeats well drawn in two styles—one a peony, very delicate; also one, by Gertrude Roots, for a clever, continuous arrangeme of pattern, for which a book prize is give Fanny Hodson (Hertford) takes a bron medal for tiles—a geometrical arrangemer In wall-papers there are a very fe tasteful designs. A crude, natural sty appears to be common, and the examine say they are the worst that have been broug before them. Elsie Pardoe, Birminghar has a silver medal for an arrangement birds and foliage on a grey ground—a fair good scheme of pattern and colour, ar clever in drawing; a bronze medal is give to Ella B. Ginn, Hertford, for a design which animals are introduced rather crudel A silver medal goes to T. Kerr for an em bossed leather pattern broadly treated. Ver few designs of a decorative kind are ex hibited. Fred Mason, Birmingham, receiv a bronze medal for a piano-front in whic figures are introduced in the panels in re chalk; these figures are fairly drawn. silver medal for the same object goes to G. H Catt, Farnham, for a design in which mer maids and shells are fancifully introduced o a dull-green background. A spandrel wit figure on gold ground in glass mosaic, b Henry C. Fripp, receives a bronze medal the same student receiving a gold medal fo a design for a domestic stained-glass windov subject "The Daniads," original in desig and graceful in arrangement and drawing We must also mention in this class of desig a modelled frieze in low relief in plaste by Marion Thornthwaite, of Manchester, an another bronze-medal sketch design fo stained-glass panels, a clever study, b G. W. M'Kean, Leek. The same prize i awarded to Sydney Meteyard, Birmingham for a stained-glass window, subject "Deborah," the figure shown in a full size cartoon, and another by T. Stokes West Bromwich.

Amongst the designs for pottery we ma name Gertrude Root's design for plate, wit cupids arranged in border, the centre rathe weak, which takes a silver medal; Clar Thompson's design for plate, cup, and sauce ewer, &c., aster pattern conventionalised, i blue and white (a bronze medal); and Fred W. Hatton's neat design for a printed borde to plate, in which the iris flower is pleasingl adapted and simple in its repetition for thi kind of treatment. Annie Barnett, Man chester, takes a silver medal for a design fo a plate, Persian in style, and agreeable i the colour. The designs for textiles, hang ings, carpets, &c., are numerous. A silve medal goes to A. Cartwright, Macclesfield for a silk hanging, showing a rich arrange ment of colour, and a clever treatment o lilies and tigers, out of the common-place and bold in design. Lindsay Butterfield als gains this medal for designs for cretonnes, i which an ingenious arrangement of leaf an flower entwined in diagonal lines is shown W. Rawlinson's (Burnley) design for a cotton printed hanging on deep blue ground is als clever in the arrangement of flowers for th purpose. Other designs are the following —Bronze medals to J. Atherton, Bradford for a brocaded hanging of heraldic devices gold pattern on yellow ground; to B Fletcher, Leicester, for a conventionalise design; Thomas Holmes, Leeds, for a bold silk hanging; Mary Mohun, Canterbury, fo a silk damask, a clever arrangement of repea in brown and green; Robt. Sloane, Glasgow for a carpet of Oriental design. Book prizes have been awarded to Thomas Barret for a clever adaptation of foliage and flower for a printed cretonne; to W. Speirs, Glas gow, for a boldly arranged scroll pattern i delicate shades of red and green; to Joseph Slade, Manchester, for a clever natural treat ment of foliage and flowers rather crowded and to Albert G. Godwin, Macclesfield, for a bold adaptation of natural forms on a green ground. Silver medals are awarded t Archibald Walker, Glasgow, for a nice arrangement of natural forms and colour or

a carpet, but rather weak in effect; and to G. Beardsley, Nottingham, for a clever conventionalised design for carpet, but the border is scarcely bold enough for the field. The designs for embroideries and laces are few. Alice Jacobs has been awarded a silver medal for a very handsome design for a curtain to be executed in cut linen and embroidery with interlaced Irish ornament, but the latter is rather out of keeping with the embroidery; also for a portière to be worked on linen with coloured flax thread. The ground is well filled by the ornament, which is suitable for the material. E. Anderson, of Cork, shows some taste and invention for designs for altar frontal hand laces, suitable to the material, which receive a silver medal, which is also given to Annie Steen, of Birmingham, for three designs for edgings.

For figure compositions we must notice the design of Gertrude Lake, Manchester, for an oil interior of a carving class-room with students at work. The figures are well grouped and life-like, the execution unaffected and full of life, and the colour luminous. Gertrude Bradley, of Birmingham, takes a silver medal for a figure composition of children at play, full of spirit and animation, lightly tinted with a clever border of the fox and geese. Other designs of a special kind we must leave for a future notice.

The architectural drawings from measurements are of interest, and we may conclude this notice by referring to them. A silver medal is awarded to P. O'Sullivan, of Cork, for measured drawings of the pulpit in St. Mary's Church, Youghal. The sounding board and details are in the style of the 17th-century, heavy and impure Classic, the plan hexagonal. Heber Rimmer, Chester, wins a silver medal for some clever drawings of Compton Wynyate, Warwickshire, dated 1527. These are well drawn and figured, and comprise elevations of west and south fronts, and large details of gable and hall-porch and bay. A silver medal is also given to Arthur H. Hind, A.R.I.B.A., for sketches in pencil and ink illustrative of a "Cycle Ride, Leicester to King's Lynn," including sketches of Barnack Church, old houses, Croyland Abbey, Abbot's Gateway, Peterborough, Terrington Church, &c. Bronze medals are awarded to the following:—W. Brand, Ipswich, for drawing of font in Bramford Church, Suffolk, of Late character, and a Perpendicular screen in Drinkstone Church, in the same county; Matthew Hack, Leicester, for measured drawings of Kirby Hall, the details rather poorly drawn; John H. James, Cardiff, for drawings of Llandaff Cathedral; John R. Wright, York, for drawings of Sherburn Church, an example of Norman and Perpendicular work; Fred Gregory, for measured drawings and details of Picture Gallery, Hardwicke Hall, Derbyshire. Book prizes are awarded to Fred Sawyer, Brighton, for a neat drawing of chancel screen of St. Nicholas' Church, in that town; to Dews, for drawing of screen in council-chamber, Wakefield Town-hall; to Fred Shaw, Blackburn, for a drawing of an old oak cabinet at Samlesbury Hall. A drawing, a portion of elevation of Imperial Institute, by George T. Scott, receives a bronze medal.

Several very creditable examples of modelling in plaster are exhibited. A gold medal is given to Peter McCrossan, a South Kensington student, for a modelled design for a panel, a gracefully arranged relief, showing nice gradation and delicate touch; and silver medals to John Hughes, Dublin, for a panel—refined, and clever in arrangement; to J. Patchin, Polytechnic, West London, for a design for panel, the centre figure of which is weak, but with well-arranged ornament; to Lilian Morris, Hanley, for a vase, with terpsichorean figures tastefully designed; to Florence G. Smith, of the same school, for vase and plateau in low relief, refined, with delicately-modelled ornament, but the vase is not of nice profile; to Arthur Flynn, for a panel in Italian Renaissance, showing refinement; the centre vase is inelegant, and does not unite with the side ornamentation. A mantel frieze by W. Turnbull, shows a pleasing arrangement of figures and ornament in relief; but the end pilasters are small and weak. Other works, as those numbered 488 and 77, are clever examples of modelling, in which class we may place Nos. 500, 108, and 109, three nicely-modelled panels, which receive bronze medals. A cleverly-studied model of drapery, by Peter McCrossan, is worth notice, though only a book prize is awarded to it.

HOT-WATER ENGINEERING.—VIII.

SUPPLY OF HOT WATER FOR BATHS AND DOMESTIC PURPOSES.

THE CYLINDER SYSTEM (*continued*).

IN addition to the advantages explained in the last paper, this system permits of the taps being better supplied with hot water than with the tank system first treated, as by "returning" the rising main service we can bring the hot water to almost any point, without the drawback that exists with returned draw-off services when connected to the flow and return, before described.

With all works of any pretension the rising main service from the top of the cylinder has

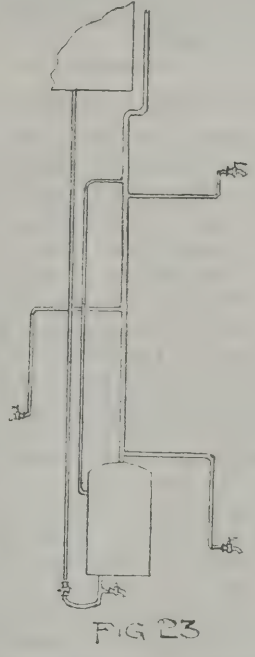

FIG 23

necessarily to be returned, as to extend this service by a single pipe for a good distance would necessitate a deal of cool water being drawn off before hot could be obtained. This service, if long, and consisting of a single pipe, would have the disadvantages of a long, single draw-off service in the tank system, although not in such a marked degree, for when the water in the cylinder reaches boiling-point the rising main becomes charged with hot water, even though it be a single pipe, the steam and other results effecting this. When, however, the demand for hot water or the power of the boiler does not admit of the water reaching boiling temperature, then a long single service is decidedly objectionable, as the water within it is often cold. When hot water is required, the cold must be withdrawn first—this is usually an annoyance to commence with—then when the tap is closed the pipe is left full of hot water, which soon becomes cold, so that there is a waste of heat. The waste of heat is improper at all times, and the waste of the cold water which precedes the hot is of some moment where the water is pumped, or perhaps limited in quantity.

When the rising main is returned, the portion from the top of the cylinder to above the level of the house-cistern is the same as when it is a single pipe. The return is started from some point below the cold-water cistern, but not necessarily high up in the house if there are no draw-off taps there. Usually it starts just by th highest draw-off service, as Fig. 23; but

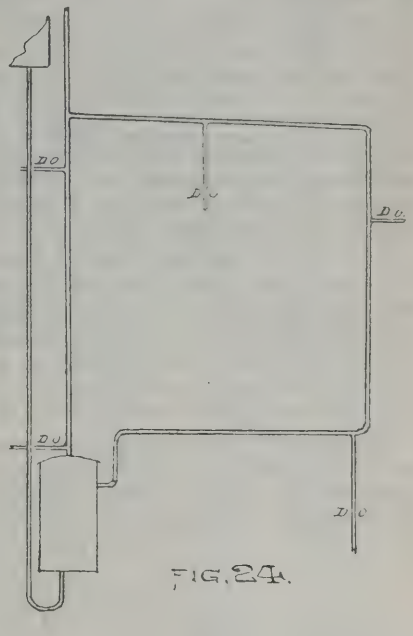

FIG. 24.

if the highest draw-off is at a bath, then the return is not needed there, as some cold water is always needed when filling a bath, and it might just as well come from the hot water tap as the other.

Now as the only object of the returned service is to prevent the water being stagnant, and to bring a constant supply of the hottest water right up to the taps, or as near to them as possible, there is no occasion for a rapid circulation to occur through this pipe, and quite a sluggish movement will be found sufficient. This permits us to effect a saving by using a smaller pipe for the return portion of the service. No harm ensues by so doing, as this pipe does not fur up.

This last illustration, and the explanation devoted to it, is of a returned rising main with both pipes following the same route—that is, accompanying one another. This method, however, is not always followed if the positions for the taps are scattered, in which case the return can be utilised by carrying it in a different direction to the flow, and taking draw-off services from it

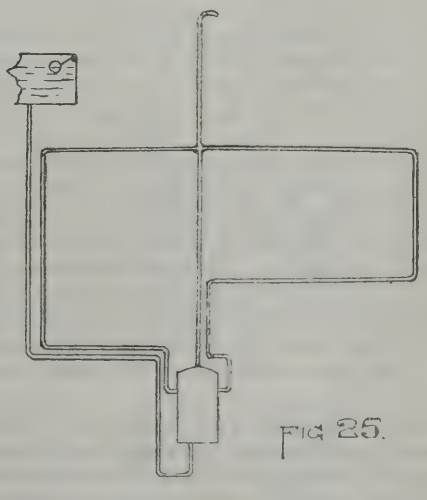

FIG 25.

as Fig. 24. In such an instance the return pipe should not be of smaller-size tube, as just recommended, except past the last draw-off service, if this happened to be some distance from the cylinder. By this arrangement, every tap can usually be near the service pipe which has the hottest water in it; but the tap nearest the cylinder in the return will not be so well supplied as those which precede it. Here again is a fault almost wholly caused by loss of heat by radiation from the pipes.

If this service from beginning to end was well felted there would not be a very marked difference in the supply of hot water to the first tap or the last. In this illustration the draw-off services are marked D O.

Sometimes, when the range or boiler is situated centrally to the work, the rising main can have two returns, as Fig. 25. This is supposing the engineer finds circumstances make it desirable. This can readily be judged, the gain effected by the two returns being a quicker supply to the distant taps than might be obtained otherwise. The writer has in mind a hotel in which the cylinder has four flows and seven returns, the apparatus being very extensive, and it is unnecessary to add that the cylinder is very large, and the boiler (an independent one) correspondingly so. When the return of the rising main, properly called the secondary return, is in duplicate, it is almost a certain sign that the apparatus is on a sufficient scale to need an independent boiler. This is not always the case, but very usually so, as can be easily understood. In this last illustration only one steam or expansion pipe is shown in the centre. It would probably be better to put two, one at each right and left-hand corner extremity. The approximate capabilities of range boilers will be referred to presently.

The point at which this secondary return should be connected in the cylinder is much disputed, and that which is shown in the last illustrations will doubtless be new to many of the readers who understand these works; but

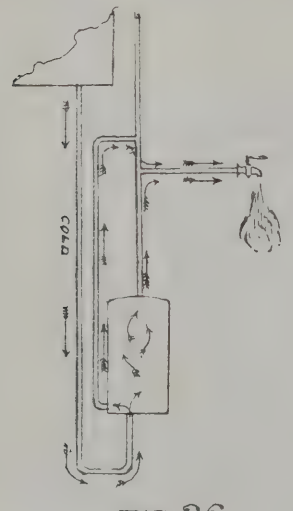

FIG. 26

notwithstanding this, it will be shown that the point indicated—viz., about ⅛th to ¼th the way down the cylinder from the top, is the correct one without the least doubt, and will always give the best, quickest, and most certain results. The usual arrangement is to either connect this service into the side of the cylinder at a very low point, or in the bottom, or to take it into the primary return pipe between the cylinder and boiler; sometimes it has been taken into the boiler itself. All these methods have sometimes been considered successful; but the success has been due, undoubtedly, to the apparatus being such that a fault of a moderate character might be overlooked by the boiler being more than sufficiently powerful, or the demand for hot water being limited. If the apparatus was one which would only meet the demand under favourable circumstances, a different opinion would have been formed.

One of the most important things to be noticed in a glass apparatus is the action that takes place when a tap is opened. This may sound unimportant to some, but it is far from being the case, for, as before mentioned, an apparatus is not unfrequently met with which heats up well, but from which the water is drawn at a very unsatisfactory temperature; in fact, it is quite often that a failure results, although the boiler is quite capable, and cannot be found fault with. This is the case when the secondary return (the return of the rising main) is connected in the cylinder or elsewhere at a wrong point. The action that can be noticed in a glass apparatus when a tap is opened, is that the water instantly rushes from all points to the tap; it is in no way governed by the direction in which the water may be circulating, nor by the rapidity with which the water is moving, nor by any other such phenomena. The instant the tap is opened the water, starting from the point where the cold supply enters the cylinder, takes every available route to reach the tap, not only up the secondary flow (as might be expected), but just as rapidly up the return. A moment's reflection will show that this might reasonably be expected, as no reason exists for the water to remain still in one pipe while its flows rapidly through another by its side, both pipes having free and open communication with one another at both ends.

Now let us suppose the secondary return was connected into the cylinder at a low point in its side, as is the most usual practice, as Fig. 26. Immediately a tap is opened the water proceeds with all its speed in the directions indicated by the arrows, and it will be seen that an almost direct communication is opened up from the cold supply to the tap, by way of the secondary return. There would be hot water passing up the secondary flow from the top of the cylinder to the tap; but the nearly equal quantity that travelled up the secondary return to the tap would be cold, so that if the water in the cylinder was, say, 200° at the top, the water that would issue from the tap would probably not exceed 120°. This is not a satisfactory result by any means; but it is a result as common as can be. It is unnecessary to give illustrations of what would occur were the secondary return connected in at the various other points referred to, such as into the primary return, &c. A little observation and reference to the last illustration will quickly show that there is only one point at which the return can be connected with certainty of good results at all times, whether the quantity of hot water at the moment be large or small, and that is near the top of the cylinder, as shown at Figs. 25, 24, and 23.

"BUILDING NEWS" DESIGNING CLUB.

A TENNIS PAVILION AND CLUB SUMMER-HOUSE.

THE holiday season has come round once more, and the work of our club for session 1890-91 has come to an end. In point of numbers the contributions of the members have compared favourably with those of previous years, and there can be no doubt as to the marked progress made in the productions of several who have been working steadily at the problems which we have set for their benefit from month to month. The standard of excellence both in point of design and draughtsmanship attained by the leading contributors to the Club this year is, notwithstanding, hardly equal to the example set in days gone by. This is to some extent due to the absence, probably, of any specially gifted men among those who have more recently joined, though for careful endeavour and general interest in their task we have much to praise our fellow-workers for. The last subject partook more of a lighter character than those given for the winter's work, and when minds are naturally turning to outdoor pleasures a tennis pavilion may with good reason be considered a seasonable problem for the energies of the architectural student. The subject certainly is one open to much improvement upon ordinary buildings of the kind. The following were the instructions issued to competitors:—"H.—A tennis pavilion and club summer-house in brick and timber, with thatched roof, suitable for a suburban tennis club. The building is to comprise a shelter 25ft. long by 10ft. deep, fitted with three rows of seats, the rows to be raised one behind the other in the usual way. A covered staircase at one end, to lead to an open-fronted upper floor, providing accommodation of similar dimensions as below. A gentlemen's dressing-room, 10ft. by 8ft., fitted with lockers on one side, a w.c., lavatory, and urinal. Upstairs, over this, a retiring-room for ladies, lavatories, and w.c. to be contrived. Provision to be made for a clock. The heights are left to competitors, and the drawings are to include two plans, two elevations, a section, and perspective view with detail of some part of the façade drawn to ½in. scale. General drawings to be drawn to ⅛in. scale."

The first place is awarded to "Eighteen 91," the second place to "Spectre," and the third place to "Albyn." We publish the first two among our illustrations to-day. "Eighteen 91" still continues very rough in his style of drawing, which in one way shows a certain amount of cleverness and "go" so necessary in original work; but it is of equal importance for success that an architect should be careful to show his intentions clearly and in a workmanlike manner, not necessary in a commonplace way, but with thought and accuracy as one who exactly knows what he is about, and how he means the details to be executed. The rough and tumble of random studies is not the best method for a student to adopt, and many a young architect has realised by bitter experience the truth of these trite remarks when dealing with contracts and contractors working on drawings produced after this method. While, therefore, we acknowledge our aim as furthering spirited suitability of design in the problems we set for our members, we unhesitatingly condemn for the best of reasons slovenly work and absence of care for practical detail so essential to good building. At the present moment we know of one of the most original and remarkable buildings which have been erected within recent years, opened only within the past few days with great ceremony, wherein the raised mouldings on some of the principal doors have had to be cut back to permit of the proper opening of the doors, and in other places to find room for the space required for their locks. The result of such patching is, of course, most unfortunate, and blameable entirely to the designer, who, although now an eminent architect, has thus done a careless and foolish thing which will always be in evidence against him.

We do not wish to be contentious, nor to throw cold water upon the designs presented for this subject, but we cannot say that we think any of them entirely suitable for erection. The conical roof over the staircase of the design placed first seems to be an excrescence having a stuck-on look, and the curved tips in the thatch along the main building would have been best omitted. The clock turret is prettily detailed, and the building would fairly answer its purpose, though the plastering between the timberings of the balcony front would be very liable to be damaged and knocked out. "Spectre" is still untidy in his drawing, and rough, without a capability of dash. The detail of his work is not good. See, for instance, the timbers of the upper stage are kept back flush in a line with the wall below, instead of sailing over, as the material suggests, and as the bold cornice renders necessary if good effect is studied, and if good precedent be followed. "Albyn" spoils his ground-floor stage by the struts, which he carries off at different angles to give strength to the gallery front. They are really not necessary, and would materially interfere with the view of those sitting at the rear of the shelter gallery. The staircase up to the first floor is more practical than in the second design, and, being straight, is preferable to the first design, which is circular. The sloping buttresses at the ends add much to the quaint effect of the structure, but for the breadth sake they should have been set at right angles with the main fronts. The drawing is poorly done, but "Albyn" has an eye to style and character which deserves cultivation. The clock is too small; the players would scarcely see its face, much less tell the time by it. "Smilash" exceeds the conditions somewhat by furnishing more than we asked for. He gives a club room and buffet bar behind the shelter for spectators. This is all well enough, and the club-room would be a pretty apartment with the two bays, one on either side of the fireplace, but we cannot compare the design quite fairly with the others. The difficulty of treating so shallow a building as we specified with anything like dignity of effect is obviated by more than doubling its depth in this plan. There is too much waste of space also in the building in its heights, though the detail is rather clever, and so is the plan. The sloppy drawings which illustrate "Smilash's" work are not effective, and deserve to be improved. "G" in a horseshoe does not slacken in his determination to work properly, and we fully credit him with this great merit. He also has a semicircular staircase turret at the end, which in its way is more satisfactory than the conical-roofed one by "Eighteen 91." The ridge runs into the hip of the main building, and the eaves are brought down just below those of the principal roof. They would have been better level. The general effect of the building is rather toy-like; the hips and clock gable boxed up over the posts below probably add to this appearance. In plan the dressing and retiring room doors come too close

to the public galleries entrances, and then, to make matters worse, the water-closets face these doors, so that on occasions those using these conveniences would be needlessly seen going in or out. We do wish this member would learn to draw more freely and with less niggle. His hinges on the door look like the cast-iron "shams" so greatly in vogue during the worst days of the Gothic revival. "Three Lions in a Shield" comes next, giving us a design which breaks forward towards the centre of the front with the staircase, under the half-space of which he contrives a reporter's gallery or scoring box. The design is spoiled by the fact, for one thing, that everyone going upstairs must come in or go out in front of those below, passing and repassing to the inconvenience of everybody. The clock face is square, set diagonally. The retiring rooms are ample and convenient, and the design, as a whole, commands itself to approval, save where we have objected to it. "Thinlin" draws so poorly in perspective that he quite fails to do his designs justice, not that any one could make the roof of this design look otherwise than ugly. The arcaded front below, and the plain turned uprights to the balcony above, are very nicely managed. The projecting balcony front is pretty too; but the tiles would soon come off in so exposed a position with excited spectators leaning over, and not infrequently larking about. There are too many winders in the staircase. "Multum in Parvo" utterly ruins his elevation by the shockingly ugly curved roof over the staircase. It would be difficult to construct, and having the hip of the principal roof running into it, is bad in every way. In other respects the design has several good points about it, and the details show study and care. "Black Prince" is very neat, and in not a few particulars his design resembles "G" in a horseshoe, already remarked upon. He adds a refreshment and cooking room behind in conjunction with the gentlemen's dressing-room. The ladies' closets over the buffet and kitchener would give trouble. The details of this design are carefully drawn, but are weak in design. "Philomath" has not improved his position this time. The wide gabled centre is not the best means of roofing a building running the other way, and the intersecting roofs on either hand further cut up the construction and spoil all grace of effect and simplicity of line, so essential to true picturesqueness. The plans are not particularly good either. "Etudiant" draws carelessly, and gives a tilted look to his building, which has a square staircase tower above; and "The Bard" has a notion of grouping well, but the projections which he obtains with this end would impede the view of the game to those in the galleries erected for spectators. This is a fatal objection in a grand stand of this sort. "Sphinx" goes in for three floors, and needlessly restricts the first-floor gallery. His perspective bears no reference in its general proportions to the scale elevation, and looks at least twice as wide as it should do. "Mephy" builds out rooms in front which would obstruct all view on one side. "Sassenach" sends a simple design, but his staircase for the ladies to reach the gallery by would have to pitch up like a ladder. "Better Late Than Never" makes a feature of an octagonal tower for the staircase projecting in the front. The design has good points about it in other respects. "Merlin," at first sight, seems to have hit upon a conceit borrowed from the Chinese, and this gives quaintness; but on further study it is found that the detail is very poor, and the two turrets, pretty in themselves, one at either end, do not grow out of the requirements, and would look fussy, and forced in effect. "Pickwick" misunderstood our conditions, and has drawn a summer-house, octagonal on plan, besides a pavilion and club. The other remaining designs all have some merit, and we group them in the following order of precedence:—"La Cigale," "A Pair of Scales," "A Pilgrim's Progress," "Idler," "C. H. Q.," "Monarch," and "Mikado.'

LONDON AND SOUTH WESTERN BANK: STROUD GREEN BRANCH.

THESE premises, which are now nearing completion, are being carried out for the Directors of the London and South-Western Bank (Limited), from the designs of their architects, Messrs. Truefitt and Truefitt, of 5, Bloomsbury-square. The ground-floor front is in red Mansfield stone, the entrance doors, window frames, and sashes being of polished teak. The banking chamber on ground-floor is also to be furnished with teak fittings. The upper floors are arranged for the manager's residence, and in the basement are placed the strong rooms, the doors and grilles for which have been supplied by

the Milner Company; the heating apparatus is by Messrs. Perkins, the contractors for the whole being Messrs. G. E. Bryan and Son, of South Norwood.

PRICES.—XII.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

THE following particulars of charges and regulations made by the City authorities came to hand too late for insertion with those already given.

Charges made for making good roads vary with the streets the work is done in. The following are a fair selection of streets and prices for new and repairing work.

Gresham-street.

		£	s.	d.
Concrete	per yard super.	0	2	0
Asphalte, 2½ thick	ditto	0	11	0
Maintaining for 7 years	ditto	0	1	3

Repairs ordered by the commission should it undertake the maintenance of the pavement.

Concrete	per yard super.	0	4	0
Asphalte	ditto	0	12	0

Repairs over openings for gas, water, and other purposes.

Concrete	per yard super.	0	4	6
Asphalte	ditto	0	12	0

(Weight of asphalte at the endof 7 years per yard super, 130lb.; at the end of 15 years, 90lb.)

Old Bailey.

Concrete	per yard super.	0	2	0
Asphalte	ditto	0	11	0
Maintenance	ditto	0	0	10
Repairs:—				
Concrete	ditto	0	4	0
Asphalte	ditto	0	14	0

Aldgate.

Concrete	ditto	0	2	3
Asphalte	ditto	0	10	9
Maintenance	ditto	0	1	6
Repairs:—				
Concrete	ditto	0	4	6
Asphalte	ditto	0	12	0

Fenchurch-street.

Concrete	ditto	0	2	3
Asphalte	ditto	0	10	9
Maintenance	ditto	0	1	6
Repairs:—				
Concrete	ditto	0	4	6
Asphalte	ditto	0	12	0

Footway Pavements.

Asphalte	ditto	0	5	6
Maintenance	ditto	0	0	6
Repairs:—				
Concrete	ditto	0	1	9
Asphalte	ditto	0	6	0

Bishopsgate-street Without.

Asphalte	per yard super.	0	5	6
Maintenance	ditto	0	0	4
Repairs:—				
Concrete	ditto	0	1	6
Asphalte	ditto	0	6	0

Leadenhall-street.

FEES FOR LICENSES.—HOARDINGS.

	£	s.	d.
If to remain not more than two weeks, per foot lineal of frontage	0	0	6
If over two weeks, and not more than four	0	1	6
If over four weeks, and not more than eight	0	4	6
If over eight weeks, and not more than twelve.	0	9	0
For every month, or part of a month, beyond the twelve weeks, per foot lineal	0	5	0

SCAFFOLDS.

	£	s.	d.
If to remain not more two weeks, per foot lineal of frontage	0	0	4
If more than two weeks, and not than four	0	1	0
If more than four weeks, and not more than eight	0	3	0
If more than eight weeks, and not more than twelve	0	6	0
If more than twelve weeks, and not more than sixteen	0	10	0
For every month or part of month beyond the sixteen weeks	0	5	0

RAKING SHORES.

		£	s.	d.
If to remain not more than two weeks	each	0	5	0
If more than two weeks, and not more than four weeks	ditto	0	15	0
If more than four weeks, and not more than eight	ditto	2	0	0
If more than eight weeks, and not more than twelve	ditto	4	0	0
For every month or part of a month beyond twelve weeks	ditto	2	0	0

No fee for either hoard or scaffold to be more than £10.

When a license is renewed, the fee is to be that which would have been charged had the license been taken out for the full time at first less the sum of money already paid for the first license.

Each application for hoard or scaffold must give the following information:—

1. Name of street or place and No. of house.
2. Nature of work to be executed.
3. Area of ground level of premises to be built, or old premises largely altered.
4. Number of stories, including ground floor, if new premises are to be built or old premises altered.
5. Length of hoarding or scaffolding needed.
6. Time for which license is requested.
7. Name and address of building owner.
8. Ditto ditto architect.
9. Ditto ditto builder.
10. Ditto ditto applicant.
11. Date of application.
12. Signature of applicant.

REGULATIONS.

The Inspector of Pavements is to report the time he thinks needful for the hoard or scaffold to be licensed. The license is then to be made out and the conditions entered in the book by the Clerk.

If there is disagreement between the applicant and the Inspector as to the time needed, the Engineer to the Commissioners is to decide.

No hoard or scaffold is to project beyond the footway pavement where it is narrow, nor more than 6ft. where it is wide enough to admit of such projection. Any deviation on account of special reasons is to be stated on the license.

No hoard is to have doors opening outwards. No scaffold is to be inclosed so as to prevent passengers passing under it.

The lower stages of scaffolds are to be close or doubly planked, each stage to have fan and edge boards, and such other precautions to be taken as the Inspector of Pavements requires, to prevent dirt or wet falling upon the public, or for the public safety.

No materials are to be deposited below any scaffold.

If, in the opinion of the Inspector, it is necessary for the public safety, a hoard license to be granted instead of a scaffold license.

Where practicable or needed, a boarded platform 4ft. wide, and as much wider as may be necessary for the traffic, with stout posts, rails, and wheel kerbs on the outside of it are to be constructed outside the hoard or scaffold, as the Inspector may direct.

Where the Inspector thinks it necessary in the public interest, applicants shall form a gantry stage or bridge over the public-way, so as to allow the foot-traffic to pass beneath it. The gantry is to be double planked, and so constructed as to prevent dust, rubbish, or water falling upon the foot-passengers, and the license shall keep the public-way beneath it clean to the satisfaction of the Inspector.

Hoards and scaffolds are to be watched and lighted at night.

All fire hydrants must be left uninclosed in recesses, formed of such size and in such manner as may enable the hydrant to be easily got at and used.

Public lamps are not to be inclosed without permission of the Inspector of Pavements. When such inclosure is permitted, the applicant shall put a lamp or lamps temporarily outside the hoard or scaffold, so that the public-way may be properly lighted.

The licensee shall undertake to employ and pay the Contractors to the Commission, to make good the pavements, lamps, and all works disturbed, to the satisfaction of the engineer.

NOTE.—A new scale of charges for using any hoard for advertising purposes is now printed, but not issued; it is a *prohibitive* one, the space on the hoards in best positions being charged at the rate of 4d. to 6d. per foot super. beyond the license for hoard. As soon as issued, it will be printed in these articles.

MASON.

HOPTON WOOD STONE (*Continued*).

		£	s.	d.
Half sawing	per foot super.	0	0	8
Plain work to beds and joints	ditto	0	1	6
Ditto rubbed to faces	ditto	0	2	0
Sunk work	ditto	0	2	6
Ditto rubbed	ditto	0	3	0
Moulded work	ditto	0	4	0
Ditto circular	ditto	0	5	6
Sawn paving, random courses, 1½in. thick, under 4ft. long, laid complete	ditto	0	0	11
Ditto 2½in. ditto	ditto	0	1	3
Ditto 1½in. ditto under 6ft. long	ditto	0	1	0
Ditto 2in. ditto	ditto	0	1	2
Ditto 2½in. ditto	ditto	0	1	5

Ditto ditto circular	ditto	0	5	4
Add for stopping to plain work	ditto	0	0	2
Ditto and sunkwork	ditto	0	0	3
Ditto and moulded ditto	ditto	0	0	4

PURBECK STONE.

This stone is very little used now, though a hard and durable one. It is best adapted fo pavings, landings, sinks, &c.

		£	s.	d.
Stone in blocks at depot	per foot cube	0	2	2
Ditto delivered within 4 miles	ditto	0	2	6
Ditto including waste, hoisting and setting, &c.	ditto	0	3	10
Half-sawing	per foot super.	0	0	5
Plain work to beds and joints	ditto	0	1	1
Ditto rubbed to faces	ditto	0	1	6
Ditto circular	ditto	0	1	10
Sunk work	ditto	0	1	9
Ditto rubbed	ditto	0	2	0
Ditto circular	ditto	0	2	6
Moulded work	ditto	0	2	6
Ditto circular	ditto	0	3	6
Add for stopping	ditto	0	0	6
Ditto short lengths	ditto	0	0	6
2in. tooled paving in random courses	ditto	0	1	1
Ditto in straight courses	ditto	0	1	4
2in. rubbed ditto	ditto	0	1	7
Old paving taken up, squared, and relaid	ditto	0	0	4
Add if set in cement	ditto	0	0	1
Tooled steps 12 by 6 set complete	per foot run	0	3	6
Small rounded corners	each	0	0	9
Plain ends	ditto	0	1	0
Small ditto as to entrances	ditto	0	0	6
6in. tooled sinks fixed complete	per foot super.	0	4	0
7in. ditto	ditto	0	4	6
Rounded corners	each	0	0	9
Holes	ditto	0	1	3
Channel stones sunk and tooled, 5in. thick	per foot super.	0	3	6
Add for steps	ditto	0	1	0
Ditto for holes	ditto	0	2	0

CASTLE HILL SCOTCH STONE.

		£	s.	d.
Self-faced paving laid complete with sawn edges, 1in.	ditto	0	0	8
Ditto 1½in.	ditto	0	0	10
Ditto 2in.	ditto	0	1	0
Ditto 2½in.	ditto	0	1	1

NOTES FROM EDINBURGH.

BUILDING maintains a steady progress, and masons' wages now stand at 8d. per hour, which has not been the case since the failure of the City of Glasgow Bank, about ten years ago. Plasterers have also got an advance, and the prospects of abundant work are as good as hitherto. The large open space lying to the north of Leith Walk has long presented a notable contrast to the other side, now covered with streets, which have made Leith and Edinburgh one, and it will shortly be laid out for building on an extensive scale. The opening of the North Park, which is the finest for all purposes of recreation—large in extent, with pure air, and commanding the most beautiful views of the city, often seen in the purple light so dear to artists—will doubtless prove attractive to speculative building. The south side, with Academy Park between, is already built up, with tenements of fair character; but along the road of its northern boundary, two villas, of an inferior class and non-descript style, make conspicuous disfigurement of the landscape, and the authorities of the Fettes College, the proprietors of the ground, appear to be unaccountably indifferent to the style of buildings so near their own.

Along the Queensferry high road, the better class of tenements, in self-contained houses, are being carried westward. The School Board has found another school is required for the suburb, our population increasing yearly west of the Dalry district. It is to be built to accommodate 600 pupils at first, at a cost of £8,000; but will accommodate double that number when completed. Probably there is still something to learn in the way of school planning for larger schools, and more will have to be done in the way of multiplying class-rooms; the great impediment to good teaching in largely-attended schools being the enormous magnitude of the classes, especially in junior departments.

The Antiquarian Museum, removed many months ago from the Royal Institution Room, will be opened shortly in its new home in the National Portrait Gallery building in Queen-street. The Royal Archæological Institute meets this year in Edinburgh, and influential parties have recently opened an Exhibition of Heraldry in one of the upper rooms. This is free to the public, and will remain open for a month or two. It is the first of its kind, and well worthy of inspection. The Gallery of National Portraits has not proved so attractive to the general public as might have been anticipated. For one thing, the building is rather out of the circuit where most other things and places of public interest are found. Curiosity, once gratified, as to the personal appearance of celebrities, however great, is easily satisfied, and only those able to appreciate the merits of a picture as a work of art will care to revisit it. The rooms where they are placed are also ill adapted for exhibition of such works from lack of a top light, and the upper rooms, where the exhibitions of prints and statuary are placed, would be much more suitable. The great proportion of floor to wall space available for pictures on the second floor suggests the idea (if it could be carried out) of combining the more popular collection of antiquarian exhibits with the national portraits. The two could be made illustrative of each other, and the former more interesting, if only by the variety secured.

The collection of heraldry, though in the greater portion unintelligible to any but those well versed in the science, has a vast number of articles interesting on other grounds, either as works of artistic decoration, or from their antiquity and historical importance. The prefatory note to the catalogue states that many subjects have been placed at the disposal of the committee, which are not only valuable in themselves, but which have never previously left the custody of their owners. The number of the exhibits is considerably over the thousand, and a great number are under cover in cases at the walls, or in stands running along the centre of the room. The smaller apartment at the west end is also filled, and the antiquarian and heraldic student will be rather embarrassed with the multitude of ever-varied coats of arms and their devices. Of course, the genealogical tree, as the earliest step in the direction of a science of heraldry, has a conspicuous place in the collection, fortunately for outsiders, limited in number. The first in the catalogue is "The Genealogie of the most ancient and noble house of Douglas, the chiefs of which name and families have continued in great honour and love of their princes and country these 876 years or thereabouts, since the reign of Saluathius, King of Scotland," &c. &c. The tree, trained in espalier fashion is thickly covered over with conventional circular discs, each containing the name of the member and his spouse. On the right-hand side is a companion, giving the descendants of one of the Douglas family sent to the help of Charlemagne and the Pope against the Lombards, and who became Italianised.

Another, not quite so large, but more modern in design, and more artistic in arrangement, is the family tree of the Campbells of Glenorchy. This contains several highly-finished miniature portraits, with the characteristic red locks of the Highlanders. These were the work of G. Jamieson, and of superior character to the usual heraldic portraits.

The collection is rich in old manuscripts of all kinds, many with the heraldic exhibit on the seals attached, but many also righly emblazoned or illuminated in the text. The exhibition, in a word, has specimens of most articles which it was usual in the olden times to adorn with heraldic emblems.

An interesting exhibit of this kind is a coloured drawing of the blue blanket of the Edinburgh trades, and the Cavers banner, or pennon, carried at the battle of Otterburn by the son of James II., Earl of Douglas. The banner is of sage-green silk, swallow-tailed, with heraldic devices, and the legend "Jamais Ariere." Besides the banner are laid the gauntlets of Percy which he displayed on his lance till the Douglas overthrew him in personal encounter. They are very curiously embroidered on white satin, which, however, has lost its pristine beauty. The ancient banner of the Scott or Buccleuch family, called the Bellendain Banner, is a smaller specimen, and not so artistically decorated.

Another department contains the habiliments and insignia of the heraldic officers, King at Arms, &c. The crown worn by the Lyon King at Arms on great state occasions is shown under cover, and along with it the collar, badge, and garter of the famed Order of the Garter, and others. The silver rod of the Heritable Usher of the White Rod of the old Scottish Parliament is exhibited in an adjoining case.

There are a large number of architectural drawings of interiors and portions of ancient buildings, of which the decoration is heraldic. Many of these appear to be originals of the drawings in "Castellated Buildings of Scotland," published by M'Gibbon and Ross. There are others by T. Bonner and Gibb.

Among the curiosities of the collection may be mentioned the leading strings of James VI., said to have been the work of Mary Queen of Scots, and with which she taught him to walk. They are made of rose-coloured broad silk ribbon, richly fringed and embroidered with gold and silver thread, with heraldic emblems on the broader parts, and an appropriate text of Scripture on the reins. The hand-bell of Queen Mary is also here, and the book of hours she used in her last moments. The collection has many samples of old oak carving, including one of the oak doors of Stirling Castle, much curious

embroidery, utensils of various kinds, plateaux and plates, mugs, &c, all richly decorated with heraldic devices. Among these there is the back or remnant of a chasuble in blue silk, decorated with lions, lilies, and peacock, carrying three upright feathers on their backs. The cross is of crimson silk almost covered with scrolls and armorial bearings of appliqué work. All these numberless examples indicate how great a place the science of heraldry once held in architecture and the arts of daily life.

There are many curious prints, such as the Assembling of the Scots Parliament, when a long procession winds its way to a low, wooden inclosure, at the end of which the king is seated on his throne, with a table in the centre. A similar engraving, in three pictures, shows the funeral procession for Queen Elizabeth. A very interesting exhibit is the parchment containing the protest of the Nobles of Bohemia against the burning of Huss and Jerome, of Prague. It is in good preservation, with a fringe of appended seals to the number of 99.

The seals exhibited are very numerous, and many of great antiquity. That of Richard II. of England, is a large one, with legend, and knight with lance in rest. In many the impression is very indistinct, but in others the reverse; indicating that the art of engraving had reached some perfection in former days. The seals of the Bishops and Archbishops of St. Andrew's, from 1140 to the time of James Sharp, and of the principal Scotch burghs (Glasgow and Edinburgh excepted), with the Great Seals of Scotland, from that of Duncan II., 1094, to that of Charles II., are themselves a large collection.

DEPARTMENT OF SCIENCE AND ART.

THE art report of the Department of Science and Art for last year is not very interesting reading, though of some statistical interest. Referring to last year's national competition, the examiners on modelling, H. H. Armstead, R.A., and H. Thornycroft, R.A., allude to a "notable improvement in the treatment of the living model in relief, and also in reliefs adapted from the antique figure." They express a hopefulness that this improvement may continue, for such relief treatment is important in decorative modelled work, which is expressly fostered by the Department. The limitation of plastic art is better understood, and there is more skilful execution. The examiners in textile designs and hangings, E. J. Poynter, R.A., W. Morris, Walter Crane, and Alan S. Cole, judiciously point out that "mere ingenuity not resulting in a pleasing whole is of no great value." Many very elaborate and skilful pattern designs are intricate, but show no composition, so that the hanging or wall-paper, when seen at a little distance, reveals no plan, no arrangement of parts. All appears confusion. The Department would do more if they insisted on arrangement and composition as essentials. Designs for wall-papers have, the examiners say, been remarkably poor; the metal-work is pronounced to be faulty in style, and labour wasted in inorganic ornamentation. Is not this a fault largely attributable to the system of study pursued in the schools of the Department—viz., that of copying old examples before technical principles and the elements of adaptation of materials for design have been taught? Careful copying of old metal-work or designs is a useful training in forming style; but it does not implant ideas—our experience of it is that it rather calls into exercise faculties which interfere with and blind our perception of invention. The copyist is the "book worm" of art, and has no more claim to be recognised as an artist than a transcriber of an old volume can be called an author.

With reference to the science schools, it is to be regretted there should be a decrease in the number of schools or separate institutions in which science is taught, though in the number of classes of those institutions there is reported an increase of 281, and in pupils under instruction of 2,508. Again, the number of students who came up for examination from 1,481 schools shows an increase of 820 on the previous year, in addition to 3,248 self-taught students and pupils from classes not entitled to claim payments on results who presented themselves for examination. The payments on results of schools, exclusive of those made to training colleges, for the year amounted to £103,453, or £9,656 more than in the previous year. It is interesting to observe that in geometrical drawing considerable diversity is found among the candidates. In many cases, almost every candidate passed, whilst in others the failures were enormous, attributed by the examiners to a difference in instruction. They also think that much of the teaching is indifferent. In building construction, the report by the examiner, Lieut.-Col. H. C. Seddon, R.E, shows that the total number of papers is less than that of last year by 12, due to a decrease in the advanced papers, there being an increase in both the Honours and Elementary stages. In mathematics (stages 1, 2, and 3) the work on the whole is said to be very satisfactory, some schools showing to much better advantage than others, and it is noticed that a larger number of highly-marked papers was received than that of the previous year. The answers in geometry are less satisfactory than those in algebra and trigonometry.

THE VENTILATION OF THE HOUSE OF COMMONS.

THE Select Committee appointed on June 22 to inquire into the ventilation of the House of Commons have made their report. The total cost of the suggested alterations is estimated by Mr. J. Taylor, surveyor to H.M. Office of Works, at £4,735. They recommend that for the better general ventilation of the House of Commons, including the Debating Chamber, the Committee and other rooms, Libraries, and corridors, the existing inlets for fresh air drawn from the Terrace be enlarged and altered; and, further, that in order to provide an increased area of intake, the rooms in the basement story on the river side (eight), now used for the storage of Parliamentary papers, also adjoining room used as a general store, be made available for providing additional air inlets. That for the purpose of improving the supply to the Debating Chamber of air drawn direct from the river front of the building a more powerful air-propeller be provided, and that the existing heating and air-filtering system be rearranged and enlarged. That additional facilities for the admission of air to the Debating Chamber be obtained by making openings beneath the Members' and Ladies' Galleries, while air should be brought into the Chamber at other suitable points. That the ventilation of the Committee rooms be improved by enlarging the existing inlets or by providing additional inlets by means of vertical tubes or perforated flooring, according to the requirements of each room; also that the extraction shafts, common to all the rooms, be furnished with back-pressure valves, in order to prevent down-draughts. That the system at present used for ventilating the Committee-room corridor be altered so as to be wholly independent of that of the general ventilation of the Committee-rooms. That double windows be provided for the whole of the Committee-rooms now without them. That means be provided for the admission of air at the eastern wall of the reading and tea rooms, the air to be introduced at a high level instead of as at present from the skirting near the floors of these rooms. That the existing water-closets and urinals in the library corridor be abolished, and that others be provided at the south end of the corridor. The Committee also report that they obtained evidence on the question of taking the air for the supply of the Houses of Parliament from a high level, rather than as at present from the ground level. The Committee were informed that the former plan was adopted at the opening of the present House of Commons in the year 1851, and was continued in use until 1854, when the entire system was reversed, and the Clock and Victoria Towers, which up to that time had been used as down-cast shafts for the admission of fresh air, were altered so as to become up-cast shafts for the extraction of vitiated air from all parts of the building. No specific reason for the change is recorded in the reports; but it appears to have been thought that an improvement in the ventilation of the House of Commons had been effected by the reversal of the system, and a similar course was followed in the House of Lords, apparently after mature consideration. The Committee find that the system of drainage established in 1886 works satisfactorily. The Committee are satisfied that no return of sewage or of sewer gases from the metropolitan sewer can enter those of the Houses of Parliament; and the Committee are convinced that no offensive smells or injurious emanations now proceed from the drainage system of the Houses of Parliament, which they are of opinion is as perfect as possible. The Committee recommend that the London County Council be requested to consider the desirability of improving the ventilation of their main sewers in the neighbourhood of the Houses of Parliament.

MASONRY AND STONE-CUTTING.*

By Lawrence Harvey.

(Thirty-Third Lesson.)

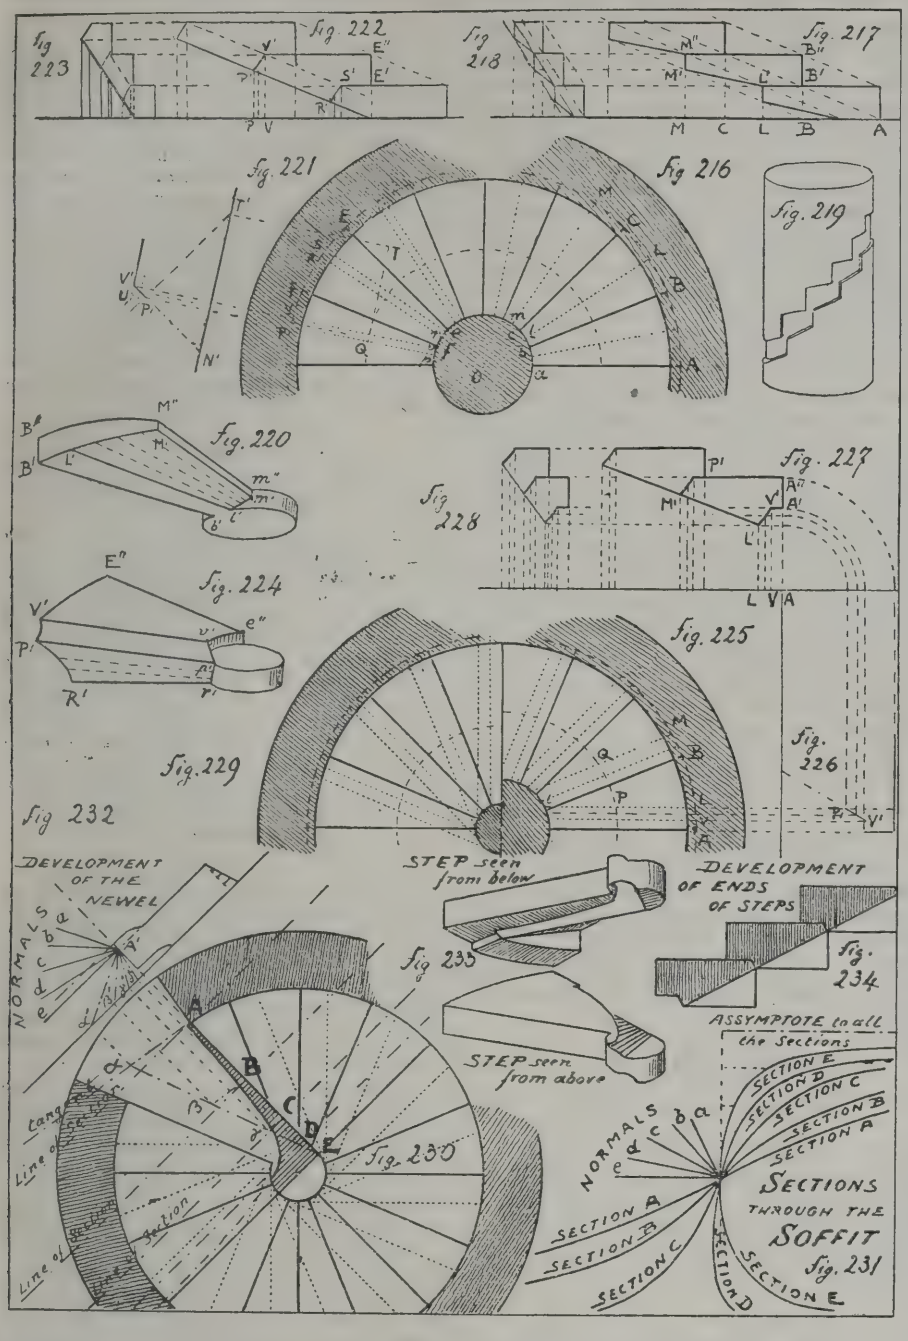
CIRCULAR STAIRS WITH SOLID NEWEL.

HERE the stairs are circular on plan, and instead of an open well-hole, there is a circular pier in the centre in which the end of the steps are notched, as in Fig. 216, or which is formed by the end of the steps themselves, as in Fig. 230. As the width of these kind of stairs does not usually exceed 3ft. between the central pier or newel and the exterior wall of the staircase, the treading line is taken half-way between the wall and newel. This treading line will be divided into a certain number of treads accord-to formula given in the thirtieth lesson. But in selecting the width of the tread especial care should be taken to obtain a clear headway of at least 6ft. 6in. between the treads of the steps below and the soffit of the steps above. Usually, the division of the stairs into 16 steps per convolution will be found convenient.

There are several ways of forming the steps according to circumstances. The simplest is the one shown in Fig. 216, where both the riser and the back of each step converge to the centre of the stairs, and the steps are simply placed one above the other, without any rebate at the joint. The back of the steps may be either left square, as in several of the circular stairs in St. Paul's Cathedral, or the under side of each step may be worked off, as in Figs. 217 and 218, where the developments of the steps along the outside wall and the newel are shown. In the latter case the spirals on the soffit develop along straight lines. To work the surface of the soffit, the outer spirals (Fig. 217) and the inner spirals (Fig. 218) are divided in an equal number of parts and then are connected respectively by straight lines.

The steps may be simply notched into the newel, the outline of the notches (Fig. 219) being obtained by winding on the newel the development (Fig. 218), or each step may comprise a section of the newel, as in Fig. 220.

Instead of having a stepped surface for the soffit of the stairs, a continuous surface is often used, as in Fig. 221, of which Fig. 222 is the development along the wall, and Fig. 223 the development along the newel.



The joint P p is convergent to the centre of the staircase, and the soffit forms an helicoid exactly identical to that which comprises the upper arrises of the steps, but placed at a lower level. It is evident by Figs. 222, 223, that if the joint were to be made normal to the soffit, it would have to be a twisted surface; but in Fig. 221 the joint is made plane, and is only normal to the soffit in the mid-point Q. The construction for finding the normal in Q is shown on the left-hand side of Fig. 221. The length of the two steps of the treading line is developed in Q T; taking an elevation parallel to Q T, we have P' at the level of two risers above the ground-line; this allows us to draw the inclination of the tangent P' T' and the normal P' N'. The normal is cut in V' by the tread of the step.

On the developments along the wall and along the newel (Figs. 222, 223) the joint appears as a segment of an ellipse, for it is there the intersection of cylinders by a plane not parallel to their centre lines. To get these curves, an intermediate point is found, as shown in Figs. 221, 222.

Here, again, the steps may comprise a slice of the newel; but, as each slice of the newel must be of the height of the riser E' E'' (Fig. 222), it follows that the portion of the step forming the joint S' R' would be below the slice of the newel. As this portion would present a very sharp angle next to the newel (Fig. 223), the lower plane of the newel is kept at the level of R', and the upper plane of the newel is dropped below the tread of the step, as shown in Fig. 224.

In both the former modes of constructing the

* All rights reserved.

steps there is a narrow strip of stone, where the step joins on to the newel, which is a cause both of weakness in the step and of waste of stone in the working thereof. To avoid this defect, the steps are usually made as in Figs. 225 and 229, where the joint does not converge to the centre of the stairs, but runs parallel to the riser of the step immediately above it. Such is, for instance, the form of the steps of several of the circular stairs in St. Paul's Cathedral. In Fig. 225 the steps are shown housed in a central pier. In Fig. 229 each step comprises a slice of the newel, which is so narrow that the joint-line of the step is tangent to the cylinder of the newel.

Now, in the construction adopted in both the Figs. 225 and 229, it is clear that the surface of the soffit of the stairs does not resemble the helicoidal surface, which comprises the upper edges of the steps, but it is a surface of quite another character. The soffit is here generated by a horizontal line, which moves in contact with a spiral identical to the treading line, and has to remain also in contact with a vertical cylinder, the cylinder which forms the newel of Fig. 229. When the step is housed in a central pier, as in Fig. 225, the joint may be plane, so as to be normal in the point P. But a plane joint, as shown in Fig. 229, will give very bad results.

To find out how this joint should be formed, cut the soffit of the same kind of stairs (Fig. 230) by vertical planes in A, B, C, D, E at right angles with the joint, and you will obtain the curves shown in Fig. 231. Now, in considering these curves, it is evident that the joint at E should be horizontal, whereas at the other end of the step in A it should have the very steep inclination of the normal *a*. This shows that the joint must necessarily be a twisted surface.

To determine the surface of the joint, produce a paraboloid formed by a horizontal line sliding on the tangent to the spiral along the soffit in contact with the wall in A, and sliding also on the vertical line E of the cylindrical newel. We know that this paraboloid will be in perfect contact with the soffit all along the joint A E (that is, the soffit and the paraboloid will have the same tangent planes in every point of the joint line); then, of course, the normals to both the soffit and the paraboloid will be identical. These normals are *abcde* (Fig. 232), and their intersection with the plane of the tread of the step gives the curve shown on plan. When the curve reaches the circumference of the newel, the intersection of the cylinder of the newel with the normals of the joint is drawn as shown in the development (Fig. 232). These lines are then drawn on cardboard moulds, which serve to delineate them on the stone step. The form of the step may be perhaps better understood by the views given (Fig. 233).

The author begs to add that a staircase formed of sixteen steps was constructed according to this design by the Upper Class of Masonry at the City and Guilds of London Institute, and the steps were quite as easily and rapidly worked as those with plane joints. The author can, therefore, recommend this construction as the most practical as well as the best construction of circular stairs where a continuous soffit is required.

Merely, as an interesting point of geometry, it may be observed that the intersection of the plane of the tread with the surface of the joint is an hyperbola. The joint is simply the same paraboloid as the one tangent to the soffit, but turned round one-quarter of a circle. The guiding plane of the joint is therefore vertical instead of horizontal; and, as we know, the sections of the paraboloid by planes at right angles with the directing plane are hyperbolas.

IMPORTANT PRACTICAL OBSERVATION.

When the steps of circular stairs comprise a slice of the newel, and are housed deep into the staircase wall, it is very important that the wall be built of freestone of the same height of bed as the steps themselves; otherwise the wall of the staircase will settle more or less than the newel, and in that case the steps will be broken at their narrowest end near the newel. If the outer wall of the staircase is to be built in brick—say, as a turret to a brick building—the steps should be simply housed a few inches in the outer wall, and should be built after the wall of the turret has had time to settle. If it be desired that the steps go through the wall, as shown in Fig. 230, then the outside of the turret should be decorated with pilasters or chains of freestone, which will practically support the ends of the steps, the brickwork being a mere filling of the panels within these features of freestone. Lastly, the same result may be obtained by using cement instead of mortar, for in that case there will be no settling.

As it is important that the newel and the outer wall be submitted to the same pressure, it follows that, if a turret containing a circular staircase has to be covered with a stone vault, that vault should bear equally on the newel and on the exterior wall. In fact, it should resemble the ceiling of the Chapter House of Westminster Abbey.

Before closing this lesson on circular stairs, I beg to call attention to a most comprehensive work on circular stairs, entitled "Die Bau-Steinerner Wendeltreppen," by Professor Rauscher, to be seen at Batsford's, 52, High Holborn.

CHIPS.

A new statue of St. Mary Magdalen, for Magdalen Tower, Oxford, has just been finished by Mr. Conrad Dressler. The old statue, some 300 years old, has fallen to pieces, and the college authorities therefore instructed Mr. Dressler to execute a fresh one. In addition to the statue, Mr. Dressler has been engaged upon an altar-front for one of the Oxford churches. The design represents Mary and Joseph leaning in adoration over the infant Jesus, who is lying at the foot of the Tree of Life. The work is in copper, electrotyped.

The church of St. Leonard, at Chapel, Lincolnshire, was re-opened last week after restoration by the Bishop of Nottingham. The little church, instead of being one of the ugliest, has now become one of the prettiest in the neighbourhood. It has been re-pewed throughout, a new porch and a new vestry have been added, the floor has been lowered and laid with tiles, and four windows with cathedral glass have been inserted; while a new prayer-desk, lectern, altar table, altar cloth, and altar rails have been provided. The work has been carried out under the direction of Mr. J. Fowler, F.S.A., architect, of Louth, the contractor being Mr. Hobson, of Hogsthorpe. The expense will be about £300.

The new church of St. James, Frederick-road, Aston, Birmingham, has been opened. Mr. J. H. Chatwin, whose plans were selected in competition, is the architect, and the builder is Mr. T. Collins, of Tewkesbury. Owing to the lack of funds, the nave is of corrugated iron lined inside with pitch-pine. The chancel is of terracotta brick with white facings, and relieved by red bands, and the roofs of deal timber. The chancel measures 40ft. by 19ft., the chancel aisle 18ft. by 14ft., and the organ chamber is of similar dimensions on the other side of the chancel. Accommodation for 500 or 600 persons is provided.

St. Paul's English Wesleyan Chapel, Penmaenmawr, was opened on Sunday. Mr. J. Wills, of Derby, is the architect, and Mr. Williams, of Upper Bangor, the contractor. The cost has been £2,700.

Alterations have been made to Barnsley Workhouse, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

NEW MUNICIPAL BUILDINGS, COATBRIDGE, N.B.—FACTORY IN GOLDEN-LANE, E.C.—DESIGNS FOR A TENNIS PAVILION, &c.—"WHITMEAD," TILFORD, SURREY.—OLD HALL, ROUGH LEE.—ST. MARK'S CHURCH, DUNDELA.—LONDON AND SOUTH-WESTERN BANK, STROUD GREEN.—LOUIS SEIZE DECORATION.

Our Illustrations.

COATBRIDGE MUNICIPAL BUILDINGS.

About two years ago the Coatbridge Town Council agreed to erect a town hall and municipal buildings at a cost of about £25,000. The master of the works (Mr. A. M. G. Mitchell), was instructed to prepare plans for three separate sites. The plans were publicly exhibited, and the design marked No. 1 was approved of. The elevations were treated in the French Renaissance style with clock tower in the centre; owing, however, to the cost being about £36,000, this larger scheme was abandoned. Design No. 2 was, therefore, selected, its cost being nearest to the sum agreed to be expended. The main façade is to Dunbeth-street, with frontages to Kildonan and Muiry-hall-streets. The town hall is situated at the corner of Kildonan-street, with a grand entrance from Dunbeth-street. The basement floor is occupied by a fire-engine station, caretaker's house, registrar's and chamberlain's offices, police cells, production rooms, &c. On the ground floor there is a grand entrance hall (54ft. by 34ft.), the floor of which is laid with mosaic tiles, and having an oak panelled dado to the walls with marble columns to the staircase. Leading off the main entrance we pass into the big hall, which is 108ft. by 53ft., provided with sitting accommodation for 2,000 persons. Provision has been made for an organ in a recess at back of the platform. Branching off from the main entrance hall a corridor leads to the reception and committee rooms. The municipal part of building is occupied by the town clerk's offices, the magistrates' room, the police-court (37ft. by 25ft.), the cells, a charge-room, superintendent-room, male and female witness rooms, &c. On the first floor is the gallery of the hall and a promenade over the main entrance, adjoining which is the lesser hall. The municipal part of the first floor is occupied by the master of works office, the council chamber, 37ft. by 25ft., the police barracks, with reading and recreation-rooms, dining-room, sergeants' room, bath-room, and 15 bedrooms for the accommodation of the police. The stone is from Gatelawbridge quarries, and supplied by Messrs. Thomson and Sons. We publish a general view of the buildings and the two principal plans.

FACTORY, ETC., GOLDEN-LANE, E.C.

The premises illustrated are in course of erection in Golden-lane, City, for Messrs. I. and R. Morley, of 18, Wood-street, from the designs, and under the superintendence of, Mr. Henry J. Treadwell, F.S.I., of 2, Waterloo-place, Pall Mall, S.W. The buildings have a frontage to Golden-lane of about 90ft., and to Brackley-street of about 112ft., and will consist of eight floors, including a basement and a sub-basement. The basements will afford spacious storage room for goods in bulk, a van-dock being provided in Brackley-street, with descending table-lift worked by hydraulic power. The upper portions of the building at Golden-lane end will be devoted to the purposes of a factory, while the upper floors at the other end of the building will be devoted to sleeping accommodation for about 120 porters. This latter portion of the building will be distinct from the business premises, and will be approached by a separate staircase. A central area lined with white glazed bricks affords thorough ventilation and light to the bedrooms and corridors. A spacious library and a smoking-room is provided for the use of the men; also lavatories, baths (hot and cold), and all necessary conveniences. A separate "sick-room" is provided in case of illness, communicating with the housekeeper's apartments. Special attention is being given to sanitary requirements and ventilation, both in the factories and living-rooms. The different portions of the building are separated by party-walls and fireproof floors, every precaution being taken to prevent the spread of fire. Communication between the different portions, where necessary, is by means of "fireproof compartments" built up from the sub-basement. All staircases are of fire-resisting material, and inclosed in brick walls. All constructional wood or iron work will be cased with concrete, plaster, or other fire-resisting material. Fire hydrants and escapes will be fixed. The lighting throughout will be by means of incandescent electric lamps, the electricity being generated upon the premises. The elevations are simple, though bold in character, being designed principally with the idea of obtaining as much light as possible in the factories. The materials used are brown Portland stone and Lawrence's red Bracknell bricks, the base and polished mouldings below ground-floor windows being in grey Cornish granite. The ground-floor story is entirely of stone. Messrs. Ashby Bros., of 6, Union-court, are the general contractors. Mr. Osborne is the clerk of works.

"BUILDING NEWS" DESIGNING CLUB: DESIGN FOR A TENNIS PAVILION.

(See description on page 138.)

"WHITMEAD," TILFORD, SURREY.

This house is about to be erected at Tilford, near Farnham, Surrey. The walls, including all mullions, &c., are of red brick. The roofs are covered with red tiles. Mr. Pink, of Milford, is the builder; Mr. Edwin L. Lutyens is the architect.

ROUGH LEE HALL, LANCASHIRE.

For the romantic associations connected with Rough Lee Hall, or the Witch's House, as it is called, I would refer readers to Ainsworth's "Lancashire Witches." Though a fair specimen of a Lancashire squire's house of the time of Elizabeth, its chief interest lies in the fact of its having been the residence of Mistress Alice Nutter, a lady of rank, who was executed at Lancaster Castle for witchcraft in 1612. Built in a deep, narrow valley at the foot of Pendle Hill—the long back of which, some 1,850ft. above the level of the sea, appears over a succession of lesser heights rising immediately behind the old hall—the seclusion of its situation is most impressive, and quite in keeping with what is known as to its history. Perhaps the most noticeable feature architecturally is the chimney-stack at the east end, with its Norman-like arcading, reminding one of another instance—viz., Barcroft Hall, in which Norman detail has been introduced in Elizabethan or Jacobean work. On the north side of this portion, which was probably the kitchen wing, a small stone vaulted cellar projects from the main building. The principal entrance was at the west end, but is now inclosed by an erection of later date. Internally the building has been much altered, having been converted into four separate tenements, two only of which are now occupied. The detail throughout is very simple, but not coarse. The square oak floor-joists are exposed to view, and have a small sunk mould on the underside. The chimneypieces have stone corbelled jambs and lintels, and in the bedrooms the roof timbers are exposed to view.

J. Langham.

LOUIS-SEIZE DECORATION.

The accompanying illustration shows rather more than half the room-side, the fireplace being central. The relief of the mouldings forming the panels is very slight, and their being gilt and the gold being carried into the panels in parts takes off from the prominence that the panelled forms may appear to have in the drawing. The colourings are: frieze, blue and gold on a paler turquoise blue ground; heads and ornament and boys between painted figure panels warm grisaille on black ground; principal panels, dark green, grey, and gold festoons and ornament on pale-green ground, with white and black in small portions and turquoise-blue margins; pilasters coloured ornament on dark grey-blue ground; dado more or less neutral; rosewood and satin-wood furniture with metal mounts, with needle-work screen and arm-chair cover.

Walter Hensman.

SOUTH KENSINGTON MUSEUM EXTENSION COMPETITION.

MR. ASTON WEBB, F.R.I.B.A., is the author of the chosen design for this great work at South Kensington, and after seeing the designs we can unhesitatingly express our entire approval of the choice which has so carefully been made. The contest was a severe one—all the more honour to the victor, whose plans were marked "S. K. M." The style chosen is somewhat ornate, with a free use of the round arch, floridly treated, a vast amount of rich detail being introduced. The façades have angle towers of Oriental character, and a fine campanile. We shall notice the designs more at length next week. The drawings are excellent.

CHIPS.

A recipe for an application for removing old paint and varnish from woodwork is given in the *Bayerische Gewerbezeitung*. Two parts of ammonia are shaken up with one part of spirits of turpentine, forming a permanent emulsion, which is applied to the paint to be removed. In a few minutes the paint will be softened, so that it can be scraped or rubbed away. This application is said to have been successful in removing old paint which had resisted the action of strong lye.

At Tuesday's meeting of the London County Council, a letter from Captain Shaw was read declining to withdraw his resignation as chief of the Fire Brigade. Considerable discussion arose with regard to Mr. Walter Emden's plans for a proposed new theatre on the site of Waterloo House, in Cockspur-street. It was stated that the Council had been threatened with a mandamus if they did not pass the plans. It was eventually resolved, by 44 votes to 6, to communicate to the Lord Chamberlain the Council's opinion that the site was unsuitable for a theatre, and that a similar communication should be sent to the office of Woods and Forests.

The Roman Catholic church of St. Wilfrid, Bishop Auckland, was recently reopened by the Bishop of Hexham and Newcastle. The church was built about half a century ago, and has just undergone repairs, alterations, and improvements. The building has been re-roofed, a new porch built, pitch pine seats substituted for the old ones, and a modern hot-water apparatus provided for the church, sacristy, and presbytery. The sanctuary has been enlarged, and a new altar railing and pulpit, both of carved oak, been erected. The interior of the sacred edifice has been decorated, and new gas fittings supplied throughout. The work has been carried out under the direction of Messrs. Dunn, Hansom, and Dunn, of Newcastle, at a cost of £800.

The parish church of Ashby-by-Partney, near Newark-on-Trent, was reopened, after restoration, last week. The restoration was effected by Mr. Kime, of Candlesby. The whole of the seats have been replaced by new ones of Baltic timber with heads of pitch pine, and the roof has been stained. The floor has been paved with Worcestershire tiles (Webb's), and a new pulpit of oak and reading desk of pitch pine, new oak rails, and new cover for the communion table of dark green cloth have been provided. New windows of cathedral glass (from Messrs. Bourne's, Birmingham) in diamonds of tinted green have been placed in the nave, and green and pink in the chancel.

The site for the new General Post-office in Victoria-street, Liverpool, contains about 8,300 square yards. It is situated near the centre of the chief business part of the city, and is almost equidistant from the different railway termini. It is believed that the cost of acquiring the site and erecting a suitable building will not exceed £400,000.

ST. MARK'S CHURCH, DUNDELA.

NEW memorial chancel and transepts have just been erected in memory of Sir Wm. Ewart, M.P. The part of the church to which this memorial addition is attached, and which has been used for Divine service up to this time, consisted of a dignified nave, with north and south aisles to it, and a western tower and stone spire, about 150ft. high. The new memorial chancel is 36ft. long by 25ft. broad, and the transepts are each about 20ft. long. The chancel roof is continued at the same height (of about 60ft.) as is the nave roof, with a result of great unity and stateliness to the completed pile. The transepts add much to the importance of the whole, both within and without. A new and handsome pulpit of oak, walnut, and stone has been provided. Internally, the cornice of the chancel roof is adorned with angels in oak along both sides of it, and the interior has been finished with substantial materials. The walls have been ashlared in stone. Indestructible mosaic adorns them in their arcades and plain surfaces. The abbreviated form of the name "Jesus" forms a central pattern in the mosaic decoration of the east wall. The pavement is in tiles. The architect is Mr. William Butterfield, of London, the designer of Keble College and Chapel, Oxford. The builders of the chancel and transepts were Messrs. S. and J. Martin. Thus completed, the church building is amongst the finest in the diocese. Mr. Richard Quiller-Lane contributed the sketches which we herewith publish.

BUILDERS' BENEVOLENT INSTITUTION.—ANNUAL MEETING.

THE forty-fourth annual meeting of this Institution took place on Thursday, July 23rd, at the new offices, No. 35, Southampton-row, Bloomsbury-square, W.C. Mr. William Shepherd, President, occupied the chair, and amongst those present were Messrs. B. E. Nightingale, Thomas Stirling, W. J. Mitchell, W. Scrivener, E. B. Ellis, and other friends of the charity.

Major Brutton, secretary, read the report, which stated that seven pensioners had died and four others had been elected, there being now 20 males and 34 females dependent upon the fund. The committee took the opportunity of earnestly impressing upon the subscribers and those who had not hitherto assisted that to maintain so many pensioners liberal annual subscriptions and donations were requisite from the members of the building and kindred trades. Unless this were complied with, the number of pensioners would have to be reduced, or the yearly stipend curtailed. It was also the case that the usual annual contributions did not admit of the election of all who, by force of necessity, were compelled to seek the benefits of the charity, and should the income not be increased, this difficulty could not be overcome. The receipts for the past year had been sufficient to meet the expenditure, largely owing to the exertions of the president (Mr. Shepherd), to whom the committee expressed their obligations. The annual dinner will take place, by the favour of the Worshipful Company of Carpenters, in their hall, on Thursday, Nov. 5, when Mr. B. E. Nightingale, who has consented to accept the position of President of the Institution for the ensuing year, will preside.

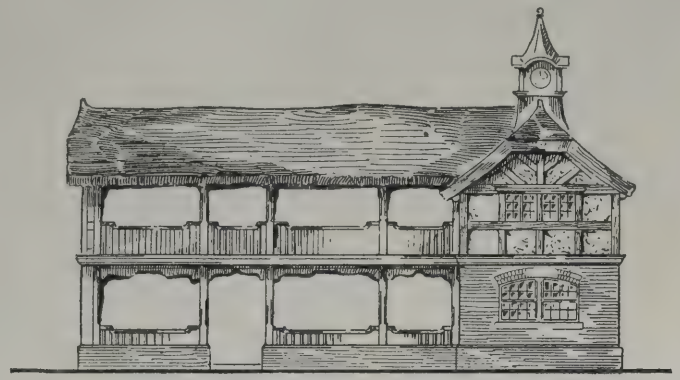
The Chairman moved the adoption of the report, which was seconded by Mr. Thomas Stirling, and unanimously agreed to.

The Chairman also proposed the following addition and amendment to the rules: Rule II., section 1a.—"A firm shall exercise all the advantages of donations given in its own name so long as any one of the original donors remains in the firm."

The motion was duly seconded and agreed to *nem. con.*

Cordial votes of thanks were passed to the president, vice-presidents, trustees, treasurer, committee, and auditors.

The Chairman then proposed that Mr. B. E. Nightingale be the president for the ensuing year.



Mr. W. Scrivener seconded the resolution, which was cordially received, Mr. Nightingale promising to do his utmost for the interests of the charity.

A hearty vote of thanks was passed to the Chairman for presiding, and the meeting separated.

A convalescent home at Seaford, accommodating 50 men, and built at a cost of £15,000, was opened by the Duke of Cambridge on Monday.

WAYSIDE NOTES.

SIR THOMAS FARRER made a good speech with reference to the future of the Metropolitan water supply at the last meeting of the County Council, and touched upon the question of a new supply—an important question, and one which is rather neglected in the semi-political struggle for the controlling of the present supplies. Sir Thomas pointed out that Birmingham was prepared to go to Parliament next year with a scheme for appropriating one of the best sources of supply, situated in Mid-Wales, and remarked how undesirable would be a scramble for water between Birmingham and London. There is, perhaps, little fear of any such scramble; at the same time, as I have often said, London should be ever watchful as to possible sources for her water supply, at such date as the present supplies are proved either unfit or insufficient. And not only watchful, but wakeful and energetic, or her large towns will be thinking of tapping sources that would well serve the London demand. Perhaps the County Council's committee are going into this matter fully, and will report on the various possible sources of supply. It is probable, as Sir Thomas Farrer has laid stress upon this point, that the Special Committee charged with the water question will issue an elaborate report in due course. It would prove an interesting document, and, in the eyes of those who look beyond the mere question of control, deal with a subject of vital importance, even if the importance be not evident to everyone at the present day, when there is water and to spare.

In the sad Gateshead disaster there is some point or another to be explained. That large structures such as the condensers that collapsed like a house of cards should so fail, is a fact that unsettles many of one's ideas as to the stability of buildings of this type. One thing that seems to clear itself of the mists of uncertainty that surround the occurrence is that stonework is an unsuitable material to employ anywhere where fire and heat are concerned. There appears to have been a considerable quantity of masonry in the condensers. Indeed, the foreman of the unfortunate manufactory attributes the collapse of the first shaft to the action of the heat upon the flagstones at its base. This is a slightly different theory from that which ascribes the fall of the condenser to the cold water thrown on the fire with the intent to extinguish it. Practically, however, it is the same, and goes to prove what was said above, that stonework of any kind, and concrete of any ordinary kind, should not be employed in positions where there is any likelihood of heat and fire. Bricks and firebricks are the proper materials in such places, speaking generally; for it must be admitted by those ignorant of the exigencies of the particular business and manufacture, that there may have been reasons necessitating the stonework in these Gateshead condensers.

More news concerning "The Tower," as proposed, at Wembly Park. Much of it seems to be published periodically, such, for example, that an estate of 280 acres has been purchased," &c., &c. The real "news" concerns the foundations. These are to consist of four concrete blocks, 25ft. by 20ft. by 25ft. deep. The excavation for one of these blocks is nearly completed. The elevation of the site at Wembley Park is about 140ft. higher than the site of the Eiffel Tower. The ironwork of the "Wembley Tower"—as there seems some probability of the edifice becoming popularly styled—will be 1,000ft., and will stand on a pedestal 150ft. high. The total height will thus be 1,150ft., and the highest part will be 350ft. above the level of the Paris tower. The press were invited to inspect the works on Saturday last, and according to the *Standard*, "there is undoubtedly an attractive settlement being formed, which, if it can be always reached with the promptitude of Saturday's journey, should prove a popular place of resort as well as residence." This should cause speculative builders to be on the alert, and perhaps induce our friend Mr. B. to run down to Wembly and prospect the site and ascertain the nature of the road scrapings of the district.

There is some possibility of the erection of an observatory at the summit of Mont Blanc. At a meeting of the Academy of Sciences, at Paris, on Monday last, M. Janssen, who last year proposed such an observatory, announced that his appeal for assistance had been responded to. M. Bischoffsheim, member of the Academy of Sciences, Prince Roland Bonaparte, Baron Alphonse de Rothschild, and M. Eiffel have offered their assistance, so that it will be possible to undertake at once the preliminary work for the establishment of the observatory. The difficulty will be in obtaining a foundation on the solid rock. The thickness of ice is doubtless very great, and will have to be penetrated, or the scheme will be futile, it being of course absolutely indispensable for an astronomical observatory that the foundation should be of the most enduring description. None seems to know the exact thickness of this ice. If it be very great, the idea of the observatory will have to be abandoned. M. Janssen's Alpine guide thinks it is of no considerable depth. In any case, the preliminary works—boring for the rock—must be very hazardous. M. Eiffel proposes, in place of sinking shafts, to cut a horizontal tunnel through the ice, so that the workmen may be sheltered from cold and storms. If the attempt be successful, it is evident that the cost of the completed observatory will be very great, and the difficulties of construction, carriage of materials, &c., enormous, so that an account of the works from commencement to completion would form a most interesting book. As to the result, the clear air of the summit of Mont Blanc would certainly render the proposed observatory most useful to science.

The timber trade complain that the revised Railway Rates are much against them. "A West Coast Timber Merchant" explains that the system of machine weighing, as distinct from measurement weight, is an innovation likely to cause the trade considerable expense in the fitting-up of weighing machines, unless the merchants be willing always to accept the railway companies' statements of weights as correct. It may be as "West Coast Timber Merchant" says; but he alludes to railway companies much as he would to dishonest grocers, or fruit-hawkers in the City, as addicted to frauds in weighing. On the point of convenience of measurement *v.* weight he is doubtless correct, and some expense may be caused to those who have to provide weighing-machines; but ignoring the question of convenience to either parties, the system of measuring by weight is fairer, seeing that timber of the same class may vary in weight. It would be interesting to hear others in the timber trade upon this question.

A praiseworthy attempt is being made to protect the rights of the public to sail the length and breadth of the Norfolk Broads. These pleasant holiday haunts are much too precious to Londoners to become a thing of the past, and financial assistance to the Defence Fund that has been raised will be money well bestowed. GOTH.

The local board of Torquay adopted last week reports by Mr. J. Abernethy, engineer-in-chief, and Mr. Inglis, acting engineer, as to the work required in the conversion of the pier into a promenade. A further outlay estimated at £8,700 is determined upon, bringing the total expenditure up to £55,100.

At the London Consistory Court on Monday, Dr. Tristram, the chancellor of the diocese, granted an application for a faculty to restore St. Matthew's Church, Great Peter-street, Westminster, and to add a vestry with chapel over on the north side of chancel, at a cost of about £1,000.

The Lord Mayor and Sheriffs on Monday visited Whitechapel, and laid the memorial stone of a new free library and museum in the High-street, nearly facing the church. The building, which is being erected from plans by Mr. J. Hennings at a cost of about £12,000, will have a frontage to the High-street of 40ft., and will extend to the rear 130ft. The lending library, large reading-room, and rooms for boys and girls will be placed on the ground floor, and on the first floor will be the reference library and museum.

A mission-house is being added to St. Frideswide's Church, Poplar, for the accommodation of sisters trained at Clewer. The building will have on the ground floor a clubroom, recreation-room for girls, parish-room and soup-kitchen, and the refectory and kitchen for the community. On the first floor will be the guild-room, oratory, and five small rooms. On the floor above are nine bedrooms, a bath-room, and a work-room. Messrs. Clarkson, of High-street, Poplar, and Great Ormond-street, W.C., are the architects.

THE LONDON CARPENTERS' STRIKE.

THE negotiations which took place on Monday last between the representatives of the master builders and the carpenters have not as yet resulted in any nearer approach to a settlement of this unfortunate dispute. At that meeting, which was held at 31, Bedford-street, Covent Garden, the offices of the Central Master Builders' Association, eight of the nine delegates appointed by the Association were present, Mr. Trollope's place being taken by Mr. G. Henshaw, jun., assistant secretary, and nine delegates nominated by the United Trades Committee. It was stated that the employers would maintain the present rate of wages, 9d. per hour, but proposed that the hours of working should be 52 per week for 40 weeks, and 47 during the remaining 12 weeks in the year. As to payment for overtime, they would give 1s. per hour till 8 p.m., 16d. per hour from 8 till 10 p.m., and double time (18d.) after the latter hour. The carpenters' representatives replied that they were not in a position to accept such terms as these, and asked for time to consult the members of the trade as to further action. At a general delegate meeting held on Tuesday, it was decided to refuse the masters' proposals altogether, and to convene an adjourned meeting for last (Thursday) evening, to discuss the point whether they should draw out more men from firms still in work, or endeavour to submit the matter to arbitration. At the time of our going to press, nothing had leaked out as to the course likely to be adopted at this meeting.

The United Trades Committee are receiving substantial contributions from branches and other trades, including £120 to hand on Wednesday from the Ironfounders' Society, while the Australian Strike Fund Committee voted the United Trades Committee, at their meeting at Mile End on Tuesday, a donation of £400 from the balance in hand.

CHIPS.

An inquiry was held at the Grays Local Board offices on Thursday morning, the 23rd inst., by Major-General C. Phipps Carey, R.E. (Local Government Board Inspector), in respect to the Local Board's application to borrow £1,100 for the erection of a fire-engine station, and of a shed for a steam roller, and for other purposes. Mr. C. Cobham, F.S.I., surveyor to the board, explained the plans which he had prepared for the station.

In the Norwich Bankruptcy Court last week, William Evans, of South Walsham, builder and contractor, was examined. The accounts showed liabilities of over £1,800 and a deficiency of £850. The debtor said he succeeded his father in February, 1888; he had not kept any records or ledgers. The examination was adjourned till August 26.

The Polytechnic Institute at Chelsea, of which the Prince laid the foundation-stone on Thursday in last week, is being built from plans by Mr. J. M. Brydon.

The thirty-fourth annual meeting of the Kent Archæological Society was held on Monday, when Town Malling was visited. At the annual meeting Earl Stanhope occupied the chair, and a report was read by the hon. secretary, Mr. Geo. Payne. Malling Abbey was then inspected, under the guidance of the Rev. C. H. Fielding and Mr. E. P. Loftus Brock, and St. Leonard's Tower and the churches of Town Malling and East Malling were afterwards seen.

On Wednesday week the foundation and memorial stones of a new Wesleyan Sunday-school at Winsford, built on the site of one condemned on account of its dilapidation, due to subsidence, were laid. The new building will be constructed of red brick, having terracotta panelling, terminals, and scrolls. The height of the building up to the eaves will be 24ft., length 100ft., and breadth 36ft. The architect is Mr. Cawley, Northwich, and the builder Mr. J. Fowles, High-street, Over.

A joint meeting of the Watford local board and the Watford rural sanitary authority was held on Wednesday week, when it was decided to carry out a joint sewerage scheme for Watford and Bushey, in accordance with a scheme proposed by Mr. Urban A. Smith, the county surveyor of Herts. The total saving to be effected by the combination is estimated at £11,958.

An abortive strike in the building trades for an eight-hour day took place in Pittsburg last month. The cause of the failure of the strike is said to have been the omission of the officers of the federation of labour to pay the strikers the wages they had promised.

Building Intelligence.

Bath.—New premises in Milsom-street, built for the Bristol and West of England Bank, were opened on Saturday. The elevation is Classic in character, Shap granite being employed for the rusticated basement, and Corsehill sandstone and red Mansfield stone for the rest of the work. The basement provides book-room and strong-room, carried out with steel lining, and faced with glazed bricks. In the public portion of the bank the woodwork of the glazed partitions is oak, and the counters and entrance doors of teak, richly moulded, the floor being laid with keramic mosaic. All the fittings have been designed and carried out specially for the bank. A yellow Mansfield stone chimney-piece, with delicate carving, is fixed in the angle of the bank. The whole of the work has been carried out by Messrs. Hayward and Wooster, except the carving, which was done by Mr. Sheppard, of Bournemouth. The decorations were by Mr. Beaven, jun., Bradford-on-Avon. The bronzes, gas-fittings, &c, have been supplied by Messrs. Singer and Sons, of Frome, and the mosaic by Messrs. Craven, Dunnill, and Co., of Jackfield. The architect was M. Alfred S. Goodridge, A.R.I.B.A., of Bath.

Guernsey.—The Forest church, dedicated to St. Margaret, and consecrated in 1163, was reopened on the 15th inst., after extensive alterations, from plans by Messrs. R. Knill Freeman, F.R.I.B.A., and S. Denison Robins, architects and surveyors, of Newcastle-on-Tyne. The chief feature of the restoration is the lowering of the floor level several inches. This has been done in order to expose to view the moulded bases of the pillars, which must have been covered up for some centuries. Many interesting relics were found during the excavation, chief among these being cannon-balls and silver coins. The floor, which formerly consisted of planks fixed on joists reposing on the ground, has been substituted by a parquet floor laid in pitch, a foundation of concrete having been previously made, the effect of which is a perfectly level surface dry and warm to the foot. The seating throughout, the choir stalls, and reading desk are from the designs of Mr. S. D. Robins, and are of pitch-pine. The Communion-table and lectern, which have been designed by the architects, are in oak, made by Messrs. Robson and Sons, of Newcastle-on-Tyne. The pulpit, the gift of the Misses Mansell, Le Chêne, Forest, is a very fine piece of oakwork made by the above firm. The whole of the windows have been reconstructed, and they are now filled with stained glass, the work being executed by Mr. G. J. Baguley, stained-glass artist, Newcastle-on-Tyne. Mr. W. Rabey, of Guernsey, is responsible for the masonry and plastering work; and the remainder of the contract has been carried out by the chief contractor, Mr. W. T. Robilliard, of Victoria-road, Guernsey.

Haydock, Lancs.—On Saturday, Bishop Royston formally opened the new parish church at Haydock, near St. Helens. It has been erected from plans prepared by Messrs. Douglas and Fordham, of Chester, and the total cost has been about £4,300. It was originally intended to replace the old parish church with the new erection; but the parishioners expressed a desire that the old, though small and inconvenient, church should be retained. The more commodious new place of worship has accordingly been built by its side. The design of the church is unique, the most prominent feature externally being a central tower with an octagonal spire 90ft. high. The upper part of the tower contains a belfry chamber. The building itself has an oak-timbered framework filled in with brick-work, in order to guard more effectually against any subsidence through the extensive coal-mining operations in the district. The total length is about 170ft., and the width, including the old parish church, with which it is internally connected by an arcade, 72ft. The height from the floor to the apex of the open-timbered roof is 38ft. The roof is covered with green slates. The floor of the church is of wood, and accommodation is found for nearly 600 worshippers. The heating apparatus has been provided by Messrs. John King, Limited, of Liverpool. The general contractor was Mr. Thomas Browne, of Chester.

Hull.—The new Victoria Hospital for children in Park-street was opened by the Marchioness of Salisbury on the 21st inst. Four years ago the plans submitted in competition by the late Mr. B. Musgrave were selected, and these have now been carried out under the supervision of Mr. W. H. Bingley, also of Hull, who assisted in the preparation. The Park-street elevation is in the Gothic style, of an Early French character, and is built of red stock bricks and Ancaster stone dressings. The main building is carried out in the plainest manner, with the strictest regard for economy. Its total cost, including furnishing, is estimated at £7,500. On the ground floor are two convalescent-rooms, 37ft. by 16ft., matron's room, and nurses' stores, and at the rear are the kitchen and scullery, the laundry being in a detached block. On the first floor, approached by a stone staircase, is the principal ward, 50ft. by 22ft., containing 16 beds, with bath-room, nurses' duty-room, service hoist, and linen store, and two smaller wards; the floor above is planned in the same manner. An entirely separate building facing Clarendon-street contains the out-door department. Messrs. George Jackson and Son, of Hull, have been the contractors, and Mr. J. Halcrow was the clerk of works. The warming and ventilating are effected by means of Shorland's double-fronted Manchester stoves, with descending smoke-flues and ornamental tiled sides; these stoves were supplied by Mr. E. H. Shorland, of Manchester.

Peterstone.—The 14th-century church of Peterstone-super-Ely was reopened on Thursday, the 25th inst., after undergoing restoration and redecoration, under the superintendence of Messrs. Kempson and Fowler, architects, Llandaff. The church was restored in 1855. A stained-glass window, in memory of the late Alderman Waring, has been erected at the east end, and a south chancel window has been given by Miss Llewellyn. A carved oak pulpit has been erected by the family of the late Rev. L. C. Lewis. The tower has been refaced, new buttresses put in, and a new parapet has been constructed. New floors have been laid, and an oak screen has been erected across the chancel arch. The new chancel seats are also in oak, the whole of the carving being done by Mr. Clarke, of Llandaff. The plastering and decoration of the interior of the church has been carried out Mr. Morgan, of Canton, Cardiff. The peal of six bells in the belfry have been recast and re-cast and rehung by Messrs. Taylor and Co., of Loughborough. The work has entailed an expenditure of £800; exclusive of the gifts.

Southwark.—A large extension to Messrs. Hayward Brothers and Eckstein's premises, under Messrs. Jarvis and Sons, architects, Trinity-square, S.E, has now been completed. This extension gives direct connection to the extensive foundry, erected about twelve months ago. The whole comprises as complete a block of premises as could well be desired. The show-rooms, offices, erecting and fitting shops, extensive, well-appointed foundry, pattern-makers' shops, and forwarding departments being carefully arranged to the three frontages, so that the raw material comes in at one side, and is completed and sent out finished from the other. There is a basement over the whole area, and Hayward's patent "semi-prism" lights have been used to the utmost, and although the width of lights on the pavement is very narrow, and patent lights being only on two sides, the effect is so wonderful that the basement is practically as light as the ground floor. There are many opportunities for showing the best way to utilise Hayward's patent lights in the pavement and stall-boards, and by the ingenious manner of forming bulkheads so that the light is not obstructed. The premises are well worth a visit both by architects and clients contemplating the erection or alteration of premises, as many good ideas can be seen in actual practice, both as to saving expense and gaining an effective light. Hayward Brothers and Eckstein have recently supplied Hayward's patent "semi-prism" lights to the new Town Hall, St. Martin's vestry; also to underground urinals, Charing Cross and Great Dover-street; also to Messrs. Bolding's new premises, which we noticed in a recent issue. We now find Mr. Willmore's business of Cottam and Willmore completely amalgamated with that of Hayward Brothers and Eckstein, and the large showrooms fitted with stable-fittings of various kinds, besides all kinds of iron staircases, ventilators, patent lights, &c. In the erecting shops are many iron staircases of all widths and heights, both spiral and straight. This class of work has been very much pushed by the firm late years, and special attention is given to t manufacture of iron, fire-escape staircases bei more necessary, to comply with the new A now in force to prevent loss of life by fire. T firm are to be congratulated on the success their foundry, which is full of work, and noticed the quality of the castings for sharpne of edge, &c., was exceedingly good, and not be excelled in London or elsewhere. This not surprising, perhaps, as the buildings a plant are so far ahead of anything we have se before for a foundry. The building is ve lofty, and has a plentiful supply of top light.

Westleton, East Suffolk. — The pari church was reopened on Thursday afternoon last week, the nave having undergone thorou renovation, which has been carried out Messrs. Cutting and Sons, builders, of Saxmun ham, under the superintendence of Mr. E. V Coldwell, architect, of 13, Bedford-row, Londo The inside walls have been entirely replastere the tower arch (which had been blocked up f upwards of 100 years) opened out, and a ne window placed in the tower. The buttresses the south wall have been restored, the outsi walls repaired and coloured, and oak stalls sul stituted for two old square pews in the chance These last are being executed by Mr. J. Fiske, of Westleton. The south side of t roof has been re-thatched with reed, and t north side repaired by Mr. Lambert, of Yoxfor The lay impropriator has also made good t thatched roof of the chancel, and will short take in hand the inside. The total cost of t work has been about £370.

Wolverhampton. — The memorial-stone the new chancel of St. Andrew's Church, Whi more Reans, Wolverhampton, was laid a for night since by the Right Rev. Bishop Bromb The church was opened in 1865, and extended 1870, but the accommodation is still below th required. By the extension now in progre about 250 additional seats will be provided, ar the estimated cost of the work is £2,800. Th new buildings consist of chancel, 36ft. 6in. b 22ft.; morning chapel, 36ft. 6in. by 17ft.; orga chamber, 22ft. by 15ft.; and choir-vestry an sacristy. The external walls are being execute in rock-faced Codsall stone, and the interior wi be faced with fine-tooled ashlar from the sam source, with wall-shafts and arcading, the shaf and sedilia being of blue Yorkshire stone. Th floor will be tiled, and the steps will consist Portland stone, with footpace of polished Devon shire marble. Internally the roof will be vaulte and boarded with red deal with moulded rib while externally the new portion of the churc will be covered with Broseley tiles. The ea wall will contain a five-light traceried window and an arched gateway surmounted with a gab and finial cross, will form the entrance to th church walk from Coleman-street. The style the work is Decorated Gothic.

At the Leicester Bankruptcy Court last wee William Walter Neale, a Leicester builder, again whose estate a receiving order was made in March applied for his discharge. The liability was £41 and the assets £302 17s. It was pointed out th 5s. in the pound had been paid by the debtor sureties towards a composition of 7s. 6d. in th pound, and the discharge was suspended for nin months.

The new cemetery at Blockley, Worcestershir was consecrated last week, when the memori cross to the late Lord Northwick was unveiled. It is Fourteenth-century Gothic in style, and wa designed and has been executed by Mr. Georg Clifford, for many years head mason on the North wick estate. It consists of a base, shaft, and Lati cross of Forest of Dean and Westington stone, an is 15ft. in height.

A design has been prepared for the window to b placed in memory of the late Dr. John Oakley Dean of Manchester, in the De Trafford Chapel, o the south side of the nave of Manchester Cathedra The proposed pulpit in the cathedral as a memoria of the late dean is now definitely abandoned, an this window is to serve in its stead. Mr. Ling the comptroller of the cathedral, has receive an intimation that the family of the late Mr Stephen Chesters, of that city, have undertake to defray the cost of the restoration of th south-west bay of the cathedral. When thi is carried out, the whole of the exterior restoratio of the cathedral will be completed, and the onl important work remaining will be the lowering o the floor. Mr. Lings has communicated with Mr Crowther, the cathedral architect, with a view t the preparation of estimates for the works.

Engineering Notes.

DOUGLAS, I.M.—The Douglas Head Marine Drive, the first section of which was opened with great ceremony on the 25th inst., has been constructed from the designs of Messrs. Jerram and Livingstone, engineers, of Westminster, and owing to the difficulties of construction, Mr. Jerram has given the work his constant personal supervision. Mr. Nowell, of Manchester, was the contractor, and Mr. F. Coulson, the contractor's engineer. The drive is throughout 40ft. in width, and will extend to Port Soderick, a distance of 4½ miles, all the land having been purchased. The road has been opened for half that distance, as far as the Walbery Cliffs, being constructed in alternate cutting and embankment along the cliff side, and is carried over a ravine at Pigeon-stream by a trestle bridge, while a suspension bridge will cross a wider ravine at the Horse's Leap. The toll-house at the entrance from Douglas Head is a castellated building.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

MIDLAND INSTITUTE: ARCHÆOLOGICAL SECTION.—An excursion was made by this section to Kingswood, on Saturday last. Mr. Jethro A. Cossins was the leader, and explained the features of the buildings visited. On leaving Kingswood station the party walked across the fields to Lapworth. There they saw the picturesque church, built in the 13th and 14th centuries, on the site of an earlier Norman building. Of this a specimen has survived in a small window, which has been left above the north arcade of the nave. The south wall of the nave is the old Norman wall, raised by the addition of 13th-century windows, its Norman lights having been decapitated, and in other places traces can be seen of the earlier building. There are signs of many altars, and over the western porch a reliquary chapel exists presenting curious features. After visiting the rectory gardens, and admiring the church and its battlements, rising picturesquely, tier upon tier, with the tower and a spire in the background, in their unusual position at the end of the north transept, the section walked to Packwood House, the beauties of whose half-timbered front are now shrouded by a coat of rough cast. Close by, within its moat, is Packwood Hall, an interesting example of domestic architecture.

SCHOOLS OF ART.

BIRMINGHAM MUNICIPAL SCHOOL OF ART.—At Tuesday's meeting of the Birmingham City Council, Alderman Kenrick, M.P., submitted a report from the School of Art Committee asking for authority to extend the Municipal School of Art, at a cost of £15,000, upon the land in Cornwall-street acquired for the purpose. Mr. Kenrick pointed out that there was a rent payable for the land of £246 a year, for which, while it was unbuilt upon, they got no return. It was further worth remembering that the cost of building materials tended to rise, and had already risen sufficiently to account for £1,000 of the increased estimate which was now presented as compared with that given when the land was acquired. The estimate had also been further increased by the greater accommodation now proposed to provide, and by better provision for heating and ventilation. The extension was needed for examination rooms, store rooms, and art laboratories, in which students in design might be brought into direct relation to the materials in which they would have to work, a need upon which stress had been laid by Mr. Walter Crane in his report upon the school. After a brief discussion the report was unanimously adopted.

The President for the time being of the Royal Institute of British Architects is among the nominated members of the new permanent governing body of the Imperial Institute.

The memorial to Marlowe, about to be erected on the site of the Old Bull Stake, at Canterbury, opposite the Christ Church gate of the cathedral, will be unveiled by Mr. Henry Irving on September 16 or 17. The memorial, upon which Mr. Onslow Ford, A.R.A., is still engaged, is to take the form of a drinking fountain, surmounted by a bronze statue of a muse, with statuettes representing leading characters from Marlowe's plays.

COMPETITIONS.

INTERMEDIATE SCHOOLS AT YSTALYFERA.—The Intermediate Education Committee, Ystalyfera, in an open competition for designs for the Intermediate Schools, have selected those of Messrs. J. Buckley Wilson, F.R.I.B.A., and Glendinning Moxam, B.S.A., architects, Swansea. These are, we believe, the first schools which have been approved of by the Glamorganshire County Council.

TOWYN.—Recently competitive designs were invited by Mr. John Corbett, for the laying out of a new estate at Towyn, premiums of £100, £30, and £20 being offered. Sixty-two sets of designs were received, and the award has been made as follows:—1st, Mr. W. Dunbar, C.E., Rhyl, £100; 2nd, Mr. Jas. B. Hipkins, Liverpool, £30; and 3rd, Messrs. Veall and Sant, Cardiff, £20.

WALSALL.—At the last meeting of this board plans for the new schools to be erected at the Pleck were considered, and on the recommendation of a committee, it was decided to adopt those under motto "Bruin." These proved to be by Mr. McConnall, of the Bridge, Walsall, who has been appointed architect.

CHIPS.

The Cardiff Corporation have awarded the widow of the man Sutton, who was killed in the Cardiff sewer on Saturday through an irruption of foul gas, £125, and to the mother of Tucker, another man who was killed through the same cause at the same time, £50. The sewers were ordered to be cleansed out. The Corporation exonerated the borough surveyor and his officials from all blame.

Two stained-glass windows have been placed in Christ Church Episcopal Cathedral, Lisburn (Down and Connor diocese), as memorials of the late Sir Richard Wallace.

Messrs. Wilson and Moxham, architects and surveyors, Swansea, have just completed a survey of one of the largest copper works in the world—viz., the Morfa Copper Works, Landore, near Swansea. The whole plan was drawn to a scale of 16ft. to the inch, showing all the machinery, furnaces, and everything in the minutest detail. The portion of works under cover is above 20 acres, besides the large piece of land which surrounds the works, which is many acres in extent.

Mr. Jasper Wilson Johns, J.P., D.L., late M.P. for the Nuneaton Division of Warwickshire, died on Sunday at his London residence, aged 66 years. He was educated as a civil engineer, and practised his profession up till 1854, when he joined the late firm of William Bird and Co., iron merchants, of London. He was an active promoter of railways in Wales.

New buildings are about to be erected in Park-place, Cardiff, to house the South Wales Institute of Engineers. In the basement will be a museum 54ft. by 21ft. 6in., and on the ground floor a lecture-theatre, seated for 250 persons, library, and secretary's room, and over these a conference hall and offices. Mr. E. W. M. Corbett, of Cardiff, is the architect, and the contract has been let at £8,000, exclusive of fittings, to Messrs. W. Thomas and Co., of the same town.

The Barnfield Hall, at Exeter, the headquarters of the Literary Society in that city, was opened on Friday. The building seats 600 persons, cost £2,000, and has been built from plans by Mr. John M. Pinn, of Exeter.

The foundation-stone of a new Free Church was laid on Friday at Lamlash, near Glasgow. The building will be Gothic in style, will seat 500 persons, and will cost about £2,000. Mr. J. Hamilton, of Glasgow, is the architect.

Mr. Urban A. Smith, county surveyor for Hertfordshire, has appointed Mr. H. W. Hart, of Watford, who was for many years surveyor to the Watford parish highway board, surveyor of highways for the Liberty of St. Albans.

On Thursday in last week a new Roman Catholic church, dedicated to Our Lady and St. Cuthbert, was opened at Prudhoe Hall, the seat of Mrs. Liddell. The church takes the place of a chapel which was erected 20 years ago, but which was found to be too small. It has been designed by Messrs. Dunn and Hansom, and has been erected on the north side of Prudhoe Hall. The architecture is of the Early Perpendicular period, and the building is constructed throughout of stone. The interior is very ornate, the carving having been the work of Mr. Boulton, of Cheltenham, while the altar and reredos are the work of Mr. Peall, of Newcastle. The baptismal font is a copy of the ancient font still in existence in the parish church of Shaddingfield, Suffolk. The nave roof is of pitch-pine, and the panelled ceiling of the sanctuary has been decorated by Messrs. Laidler.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., LVII. LVIII., and LIX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—C. C.—Capt. J.—C. N. and C.—D. and L.—G. and T. E.—G. W. R. Co.—B. V. Co.—G. W.—P. W. B.

Correspondence.

THE SOCIETY OF ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—Having been honoured by re-election to the office of president, will you pardon my writing to urge upon the attention of your readers one or two points which largely affect the future interests of the society and of the profession?

Let me first congratulate all concerned on the exceptionally prosperous and progressive condition of our affairs, which is largely due to the energy and wisdom of our retiring president, Mr. Robert Walker.

The Society of Architects, now a large and well established body of practising architects, has, from the beginning, identified itself with, and may claim to have initiated, the movement for obtaining State recognition of architecture as a profession, dealing at once with the financial and hygienic interests of the community as intimately as do either law or medicine separately, and as one in which breeding, education, and integrity are as much to be required as in the registered professions?

This is by far the most important professional movement of our times, and it is destined to succeed if the member will individually recognise their responsibility, and will sacrifice a little time to it. Nothing will promote our cause so certainly and so rapidly as enlarging the membership of the society, and we could be 1,000 strong next year if each member would resolve to introduce one or more qualified gentlemen, either by the usual nomination paper or by sending to the council the names of gentlemen eligible under our rules, and who might be elected under our revised articles of association

by special invitation of the council. Some such names will, I feel sure, occur to each reader.

May I also remind readers of the advantage the practice committee affords to the members in offering to report upon difficult questions occurring in our practice. The publication of the excellent papers in our *Proceedings* is a further advantage, while our members can feel free to make use of the offices and rooms at St. James' Hall for business appointments and for correspondence.

The council will be glad to receive the names of those who will visit Belgium on the 15th prox. The excursion promises well.—I am, &c.,

W. HOWARD SETH-SMITH.

St. James' Hall, Piccadily, W., July 30.

PARAFFIN-COPAL MEDIUM FOR PAINTING.

SIR,—I have just seen Prof. Church's letter to your paper taking objection to the notice which you published together with the reproduction of my fresco in the Royal Academy refreshment room) of the manner in which I executed the work, considering it to attribute to me the invention of the "paraffin-wax" method.

The words of the notice (which were from information furnished by myself) run: "This artist, after carefully studying the merits and demerits of the various wall-painting methods, such as tempera, spirit-fresco, paraffin wax, &c., decided to employ paraffin wax." Then follows description of merits which decided me to employ the last of the three.

I fail to see anything in the notice to support Prof. Church's reading of it; however, I am only too pleased to have a chance of saying that I owe most of my acquaintance with the method to Prof. Church, who was most kind in giving me the assistance of his valuable advice.—I am, &c.,

W. REYNOLDS-STEPHENS.

33, St. Leonard's-terrace, S.W.

HOT-WATER ENGINEERING.

SIR,—Replying to "A. B.'s" letter, as the first part of the paragraph only made allusion to square inches and parts of square inches, it was intended that the pipe referred to should be understood to be one having half a square inch area. I must acknowledge it might have been expressed more precisely, although it does not materially affect the actual point under discussion. "A. B." is, however, strictly correct in pointing out such matters, and I thank him.—I am, &c., THE WRITER OF THE ARTICLES.

Intercommunication.

QUESTIONS.

[10594.]—**Japanning.**—Can any of your readers kindly give me any information of a new system of heating and japanning stoves, either by steam or fire, for drying paint suitable for bedstead works, and oblige?—J. R. R.

[10595.]—**Book on Levelling.**—Are there separate works exhaustively treating on levelling with the "Gravatt" or "dumpy" level? I want one for the use of my pupil. I have "Every Farmer his own Land Surveyor," in which there is a chapter devoted to the subject. Good as far as it goes, but it does not go far enough; it stops at the end of the rudimentary stage.—A. H.

[10596.]—**Safe Weight on Pier.**—What weight per foot superficial may be allowed to rest upon a rubble masonry pier built of hard sandstone (Carboniferous formation), with mortar composed of one part of Portland cement to two parts of ashes?—E. D.

REPLIES.

[10583.]—**Sketching Tour in Yorks.**—The following, in the main, is the outline of a sketching tour I made about fifteen months ago:—Day No. 1: Starting from Leeds, visit Kirkstall Abbey, and in the afternoon Bolton Abbey, taking train in the evening to Ripon; No. 2, Ripon Cathedral; No. 3, Fountains Abbey; No. 4, train from Ripon to Coxwold, to see Coxwold church, and walk to Byland Abbey; walk over the moor to Helmsley. 5th day, Helmsley castle and Rievaulx Abbey; 6th day, train to Malton, walk to Old Malton church, and train in the afternoon to Kirkham Abbey; 7th, Kirkham, and on to York by train; 8th day, York, to see the cathedral, St. Mary's Abbey, and Skelton church in the neighbourhood, and back to Leeds—or the tour could be extended by taking train on the 9th day to Howdon; 10th day, train to Selby, for the abbey, and back to Leeds. "J. B. M." may consider these ideas very scrappy; but if he cares to communicate with me, I shall be glad to give him further information, and also a hint or two which might be useful.—VERNON CROMPTON.

[10591.]—**Builders' Book-keeping.**—I am in a position to show a system of keeping builders' books, which I think is one of the best, and certainly the simplest. Prime cost of any job can be shown every week. My knowledge is from experience, which I have tested in every way. I shall be glad to communicate with your correspondent. I shall be disengaged shortly, and would be willing to show him.—J. ROBERTSON, 19, Andrew's-road, Hackney, N.E.

[10591.]—**Builders' Book-keeping.**—If "Constant Reader" will write to me, I can let him, or any other reader, have worked examples of a good system.—F. I. W., Eastbourne House, Argyle-street, Ryde, I.W.

PARLIAMENTARY NOTES.

THE CHANTREY BEQUEST.—Mr. De Lisle asked the Chancellor of the Exchequer on Tuesday whether the recommendations of the Royal Academy Commission Report, 1863, had been generally carried out; whether especially the recommendation "that to the 50 professional Academicians there should be added ten members not being artists, subject to the confirmation of the Crown," had been carried out; and if so, who were the ten lay members; whether the hope expressed in Sir Francis Chantrey's will, "that the Government will provide a suitable and proper building or accommodation for the preservation and exhibition of the bequest pictures as the property of the nation," had also been carried into effect, and if so, which was the suitable accommodation; and whether the pictures exhibited in the South Kensington Museum, labelled "Lent by the Trustees of the Chantrey Bequest," were recognised as "the property of the nation."—The Chancellor of the Exchequer: I need hardly remind the hon. member that the Royal Academy is not a Government department, or under Government control. Speaking generally, I understand that some of the recommendations of the 1863 Commission have been carried out and some not, and that the proposed addition of ten lay Academicians falls within the latter class. For further information on the subject, I would refer the hon. member to the Academy's observations upon the Commission's report, dated 15th March, 1864, and presented to Parliament in the same year; and also to their subsequent correspondence with the Office of Works, presented to Parliament in 1866. As regards the hon. member's last two questions, the hope expressed by Sir Francis Chantrey has not yet been realised. The pictures are merely lent temporarily to the South Kensington Museum by the trustees, and until suitable buildings or accommodation have been provided, the trustees may fairly hold that the pictures are not the property of the nation.

STAINED GLASS.

THE LATE JOSEPH GORDON, C.E.—A stained-glass window has just been placed in the parish church of Haltwhistle, Northumberland, to the memory of the late Mr. Gordon, formerly borough engineer of Leicester, and for a few months before his death Chief Engineer to the London County Council, and a distinguished native of Haltwhistle. It consists of a five-light Perpendicular window, and is the work of Mr. Kempe, of London. On the spectator's left is a figure of St. Cuthbert, one of the early Northumbrian bishops, and on the right is a representation of St. Oswald, the Northumbrian King who defeated Cadwalla and his pagan nobles somewhere in the neighbourhood of the church which bears his name, near the line of the Roman wall, and not far from the Wall village. In his left hand he carries a cross, the symbol by which, as the Venerable Bede tells us in his history of the Anglo-Saxon Church, he "inspired his army with faith in the justice of their cause, and nerved them with a courage and heroism which completely vanquished his foes." He holds a sceptre in his right hand, and on his head rests the crown of regal authority. He wears a bishop's mitre, and in his right hand holds a crosier. The window, which is close to the pulpit, bears the following inscription:—"To the Glory of God and in loving memory of Joseph Gordon, C.E., who entered into rest November 9th, A.D. 1889. This window has been erected by his widow and children."

NEWPORT.—A three-light, traceried, painted glass window for St. Wrolos' Church, Newport, Monmouthshire, will be on view for the next fortnight at Messrs. Belham's, 155, Buckingham Palace-road, S.W. The subject is: "Christ Among the Doctors in the Temple." The design is by Mr. John P. Seddon, architect, of No. 23, Grosvenor-road, Westminster, and the composition of the figures by Miss Maud Seddon, the cartoons and painting on the glass itself by Mr. H. Murray, Messrs. Belham's artist. The whole is executed in Messrs. Rust's antique glass.

A new volunteer drill-hall on the grounds of East Sandfield House, Guildford, was formally opened last week. It is an iron corrugated building 120ft. by 52ft. 6in., used at the Exhibition at Edinburgh last year. It has been floored with wood blocks by Messrs. E. and A. Miles, of Guildford. The total outlay has been about £1,000.

LEGAL INTELLIGENCE.

A VAGUE VERBAL CONTRACT.—MORRIS v. BAYLEY AND MOORE.—In this case, tried at the Notts Assizes on Monday, plaintiff, a builder, of Daybrook, claimed from the trustees under the will of the late Thomas Bayley £163 13s. 7d. under a contract for the erection of some small cottages. In March, 1890, an architect named Harriman prepared plans and specifications for defendants for four cottages, and plaintiff's tender for their erection was accepted. Before the work was commenced plaintiff was asked if he would build eight cottages for £1,000, which was agreed to, and he began to work on the eight cottages in May. Then it was arranged that one of the cottages should not be a private house, but a shop, making the contract one for the erection of seven houses and a shop. On June 3rd a second contract was prepared, in which there was no mention of any shop. No specifications were supplied, except for the first four cottages. The amount now claimed was the amount that had been in dispute between the parties on various items in the different contracts. The judge ruled that the plaintiff was entitled to be paid for extras on a *quantum meruit*, giving credit for omissions and deductions. His lordship also ordered this action to be referred to a referee to be agreed on by the parties or named by himself, subject to the omissions and deductions as aforesaid.

ST. HELEN'S, BISHOPSGATE.—In the London Consistory Court on Monday an application was made by the rector of the united parishes of St. Helen's, Bishopsgate, and the churchwardens for a faculty to carry out certain restorations of their church on plans submitted by Mr. J. L. Pearson, R.A. These plans included the erection of new vestries, the lowering of floors, the repaving of the church, altering the position of the pulpit, the re-glazing of windows, and the addition of three windows. The estimated cost was £7,000, of which the Charity Commissioners were prepared to advance £4,092, and the Merchant Taylors' Company would give another £2,000. Mr. John Codd, manager to Mr. J. L. Pearson, R.A., Mr. T. Rolfe, and Mr. E. G. Cherry having expressed their concurrence, the Chancellor said that, with regard to the slab now lying on the floor, and said to be the original *mensa* of the Lady-chapel, it would be safer to place it on wooden pedestals than to use stone for the purpose of raising it, as that would keep it within the decision that had been given by the Judicial Committee of the Privy Council. The Court would grant the faculty as prayed, subject to certain provisoes and certain consents. Before the faculty was issued he would inspect the church, so that he might be able to direct what proviso should be inserted.

IN RE W. SOARS.—At the Leicester Bankruptcy Court last week a solicitor applied for the discharge of Wm. Soars, builder, Leicester, whose liabilities amounted to £1,035, and his assets were £87 9s. 3d. He said the adjudication was made three and a half years ago, and the bankrupt had twice since applied for his discharge. The first time was in October, 1888, and the last in June, 1889. He was granted leave to apply again in two years' time. That period had now elapsed, and he renewed the application. He submitted that the bankrupt had been sufficiently punished for the smallness of the dividend.—The Official Receiver said he did not propose to ask his Honour to refuse the application, but he thought he should know that the bankrupt had been carrying on business on a rather extensive scale in his wife's name. Mr. Burgess presumed that if the application was granted the business would revert to Soars, and he would carry it on in his own name again.—The discharge was granted.

RELATIVE LIABILITY OF CONTRACTORS AND SUB-CONTRACTORS.—JOHNSON (PAUPER) v. W. H. LINDSAY AND CO.—(House of Lords Appeal, July 28, before Lords Herschell, Watson, and Morris.)—This was an appeal from a decision of the Court of Appeal affirming a judgment of the Divisional Court. The action, which raised a question of great importance as to the extent and operation of the doctrine of common employment, was brought by the appellant, a workman in the employ of Messrs. Higgs and Hill, Crown Works, South Lambeth, to recover damages for personal injuries which he sustained through the alleged negligence of the servants of the respondent, who were at the time of the accident engaged in carrying out a contract for the construction of fireproof flats and floors in a building which the appellant's employers were erecting. The respondents disputed the appellant's claim, on the ground that he was engaged with their servants in a common employment. At the trial the jury found a verdict for the appellant, with £50 damages, but that verdict was set aside and judgment entered for the respondents by the Queen's Bench Division, the late Mr. Justice Manisty, who took part in the judgment, remarking that the question as to the common employment was a very large and important one, and expressing a hope that it would be decided by the House of

ords. The decision of the Divisional Court was ubsequently affirmed, on appeal, by Lord Justice otton and Lord Justice Lopes, the majority of the ourt of Appeal, Lord Justice Fry dissenting. The se was argued some time ago, when judgment as reserved. Their Lordships gave judgment on uesday, reversing the decision of the Court of ppeal.—Lord Herschell, in now delivering idgment, said he thought it clear upon the facts hat the appellant was in no sense the servant of indsay and Co., the respondents, and it therefore ollowed that if it were essential to the defence of ommon employment that the person suing should imself be the servant of the master by whose rvant's negligence the injury had been caused, the efence could not be sustained in the present case. pon a review of the authorities he was unable to ntertain any doubt that that was essential. The uthorities were sufficient to establish the propo- tion that, unless the person sought to be rendered iable for the negligence of his servant could show hat the person so seeking to make him liable was imself in his service, the defence of common em- loyment was not open to him. He therefore hought that the judgment appealed from ought to e reversed, and the judgment entered for the laintiff restored.—Lords Watson and Morris con- urred.—The judgment of the Court of Appeal was herefore reversed, and the judgment for the laintiff (the appellant) restored, the respondents o pay the costs in the Courts below, and the costs ncurred by the appellant in respect of this House.

Apportionment of Paving Expenses.—Ex parte the New Land Development Association.—(Lords Court of Appeal, July 28; before Lord Justice Bowen and Lord Justice Kay).—This was an application for a rule nisi for a mandamus to the Greenwich magistrate to hear certain evidence in a proceeding before him. The Lewisham District Board of Works, having estimated the expenses of paving a new street called Adelaide-road, apportioned the amount among the owners of the houses and land abutting thereon. The board, having done the work, took summary proceedings before the magistrate to recover the amount apportioned against the New Land Development Association, the owners of houses abutting on the street. Upon the hearing of the summons the apportionment of the estimated expenses was put in, and the magistrate refused to hear evidence on the part of the association to show that the actual cost was less than the estimated cost, holding that the apportionment was conclusive for the purposes of the proceedings before him, and made an order for payment of the amount. The Divisional Court refused a rule nisi for a mandamus to compel the magistrate to hear the evidence. Mr. Horace Kent now moved by way of appeal for a rule nisi for a mandamus as above. He referred to sections 105 and 225 of the Metropolis Management Act, 1855, and contended that though the apportionment of the estimated expenses was conclusive if the proceedings were taken before the work was done, yet after the work had been done the actual cost could be inquired into. The magistrate, therefore, ought to have received the evidence. The Court granted a rule nisi for a mandamus.

Claim and Counter-claim—Architect and Client.—Frederick Rogers v. R. W. C. James.—(Kent Assizes, July 18.)—This was an action brought by the plaintiff, an architect residing at Bromley, to recover £123 6s. 9d., the balance of account for work done. The defence was that the real balance was only £13 18s. 10d. and there was also a counter-claim by defendant, a wine merchant of London, for £870 for negligence on the part of plaintiff. The plaintiff was instructed to prepare plans for the erection of a house at Sundridge-avenue, Bromley, and his plans were accepted. For the preparing of these and subsequent specifications, together for discharging other duties, he now sued for payment, the defence being that the house was defective owing to the negligence of the plaintiff. The plaintiff was told by the defendant that he wanted the house erected at a cost of £2,000, including his fees, and in consequence of the first plan costing £2,500, he prepared subsequent ones. The plaintiff was examined at some length in support of the case, and cross-examined with the view of proving the defendant's allegation. He said that he was given directions concerning each room in the house, before he prepared the first plan, and that, of course, created difficulties in preparing specifications to be carried out to a general estimate. He, however, exercised usual care in preparing the original plans, but notwithstanding he had to prepare subsequent ones. He admitted certain departures from the plans, but these did not affect the condition of the house to the extent the defendant alleged. Other evidence was called to prove that the plaintiff's charges were fair and reasonable. It was also proved that the foundation of the house, which was chiefly complained of, had been passed as being in accordance with the Bromley local board by-laws. On behalf of the defendant, several skilled witnesses gave evidence as to the amount of damages that in their opinion should be given for alleged negligence. The amount was put at £870, which included £400 as reduced rental, notwithstanding that defects in the erection of the building had been remedied. The jury found for the plaintiff for £58, and for the defendant on the counter-claim for £90. His Lordship entered judgment accordingly, and allowed costs in each case.

A Lady and Her Builder.—At the Watford County Court last week, before His Honour Judge Holl, the case of Eames *v.* Graveney was heard. The claim was for £15 5s. 6d., balance of a building contract and extras for building two cottages at Croxley-green. Plaintiff, a builder of Watford, entered into a contract with the defendant last October to build two cottages at Croxley-green for £350, to be paid by the defendant by instalments, all of which had become due. There was a balance due on the contract of £10, and in addition to that there was a charge of £3 5s. 6d. for extra work done in connection with sinking rainwater wells, and £2 for taking up ranges in the kitchen and substituting others of greater value. The defendant claimed that rainwater tanks were a set-off against gravel and sand which the plaintiff came upon in his excavations, and which he used in the building; and, further, she claimed £6 2s. 10d., the cost of completing work which should have been included in the contract. George Eames and Daniel Eames gave corroborative evidence, and William V. Syme, architect, said he had been over the property in question, and thought the work had been satisfactorily performed. For defendant, it was stated that the work was done in an unworkmanlike manner, and that there were 100 loads of gravel taken out, and the hole never properly filled up. Plaintiff refused to remedy the defects in the building. Mr. Frederick Stone, architect, London, estimated that £6 2s. 10d. would have to be spent to remedy imperfections which should never have existed under the contract.—The jury gave a verdict for plaintiff for £3 17s. 2d. paid into court and £3 2s. 10d., £3 being deducted for inferior workmanship.

WATER SUPPLY AND SANITARY MATTERS.

Uttoxeter Waterworks.—A ratepayers' meeting was held at Uttoxeter last Thursday to hear Mr. W. H. Radford, C.E., of Nottingham, explain a scheme for new waterworks in the town. The present waterworks are almost useless through lack of pressure and faulty design, and it is proposed to construct a new service reservoir with water mains throughout the town, and to take powers to acquire additional springs at Somershall Herbert, 3½ miles from the town. The cost of the engineering works would be £5,450. An Act of Parliament will be required. A resolution approving Mr. Radford's scheme was passed unanimously.

CHIPS.

The Dundalk harbour board, at their last meeting raised the salary of Mr. Peter Cahill, their engineer and surveyor, from £170 to £200 a year.

The premises of Messrs. Josolyne, Young, and Co., builders, in Tennis-court, Newcomen-street, Southwark, were destroyed by fire on Friday morning.

Another of the chief officers of the Metropolitan Fire Brigade has left the service. Superintendent Port, who is the only officer in the Brigade senior to Captain Shaw, has tendered his resignation to the Fire Brigade Committee of the County Council. Mr. Port joined on the 25th October, 1858, saw Mr. Braidwood killed three years afterwards, and was the only man left in the London Fire Brigade who was present at the fire in Tooley-street. Mr. Port was in charge, under Captain Shaw, of the headquarters at Southwark from February, 1879, until April, 1889. Two years ago he was appointed superintendent of the South London district.

On Saturday the chairman of the East Ardsley School Board laid the memorial stone of a new school, which is intended to meet the educational wants of the Fall. The school will have two elevations facing Stewart-lane and Mill-lane. The designs are by Mr. J. Lane-Fox, architect, Dewsbury, and the building will be of hard stone from the Holmfirth and Lightcliffe qarries.

A new Baptist chapel has been opened at Ilfracombe. It has sitting accommodation for about 500 persons, and, including the organ, has cost £2,500.

New board schools have just been erected in Plough-road, Battersea, from plans by Mr. Thos. J. Bailey, the architect to the London School Board. They accommodate 1,200 children in three departments, and have a central hall 65ft. by 38ft. The cost was £16,250, and the builder Mr. Charles Cox, of Hackney.

On the recommendation of their asylums committee, the Middlesex County Council have decided to erect an asylum for 200 imbeciles and idiots.

Our Office Table.

It had been decided as almost a foregone conclusion that Mr. Andrew Murray, A.R.I.B.A., for the past 17 years chief assistant to the last two City Architects, would be appointed as their successor, under the title of City Surveyor, and this anticipation has been justified by the event, for at the meeting yesterday (Thursday) afternoon of the City Court of Common Council, to determine upon the election of that official, it was announced that the other candidates had withdrawn their respective applications, and Mr. Murray was introduced to the Court as the "City Surveyor." The duties of the office have been rearranged by a committee since the death of Mr. A. M. Peebles, the late City Architect, and the salary, which was formerly £1,500 a year, has been reduced to £1,000. Mr. Murray was a pupil of the late Mr. J. B. Banning, a former City Architect, and has been for thirty-seven years in the service of the Corporation. After the death of Sir Horace Jones he designed and carried out for the Common Council the City of London Court in Guildhall-buildings, which was illustrated in our pages. By the present appointment, only too long deferred, he obtains an increase of salary of £200 a year.

The National Association of Master Builders of Great Britain held their half-yearly meeting at the Castle Hotel, Cambridge, on Tuesday afternoon, Mr. J. C. White, of Liverpool (president), in the chair. It was unanimously resolved "That it be referred to the council to consider the advisability of establishing in the building trade some system of national federation of employers and employed, somewhat on the lines of similar recent associations, which should also deal with the pensioning of old and disabled workmen."

We regret to hear of the death of Mr. John Russell Walker, A.R.I.B.A. and F.S.A.Scot., which took place at his house at Duddingston on Saturday, after a somewhat protracted illness. Mr. Walker, who was a native of Monimail, received his professional training in the office of Mr. Rhind, of Edinburgh, and was afterwards with Mr. James Cubitt, of London, till about 1876, when he commenced business for himself at North Hanover-street, Edinburgh. He joined the Institute of British Architects as an Associate in 1876. He was at one time an occasional contributor to the Building News, and of late years, as a Fellow of the Scottish Society of Antiquarians, he became well known in the archæological world by his papers on the holy wells, fonts, and recumbent monuments of Scotland, copiously illustrated from his own drawings. For many years he had been preparing materials for a complete monograph on the Pre-Reformation Churches of Fife and the Lothians. The part for Fife was issued some time ago, and was reviewed in our issue of March 20th last, when we gave a double-page photographic illustration of St. Monance Church from Mr. Walker's drawings. It is understood that the drawings for the second part, comprehending the Lothians, have been all made, so that it is hoped that the work will be completed by the issue of this section.

The death was announced in Birmingham on Thursday of Mr. Francis Willmot, the well-known surveyor, of Waterloo-street, which took place the previous night at his residence at Moseley. Mr. Willmot, who was fifty-eight years of age, was the son of the late Mr. George Willmot, who was surveyor of turnpike roads, and county surveyor of Warwickshire. He served his articles to Mr. William Fowler, of Waterloo-street, Birmingham. He afterwards commenced business on his own account, and in 1872 was joined in partnership by Mr. Charles Couchman, the firm of Couchman, Willmot, and Couchman becoming very widely known. Mr. Willmot assisted his father as county surveyor for many years, and on his death succeeded to the office. On the formation of the Warwickshire County Council the control of the roads passed from the justices to that body, and Mr. Francis Willmot and his son, Mr. John Willmot, were appointed joint-surveyors. From the passing of the Ecclesiastical Dilapidations Act, 1871, until about a year ago, Mr. Willmot held the position of diocesan surveyor for the Warwickshire portion of the diocese of Worcester, and throughout the whole nineteen years never had an appeal against

his assessments. In connection with his former firm and the more recent one of Willmot, Fowler, and Willmot, he acted as agent to the local estates of Earl Howe, the Earl of Bradford, Lord Norton, Lady Scott, Mr. J. K. Digby, and other large landowners. In his earlier years he was, the *Birmingham Post* remarks, a man of remarkable energy and industry, and it is said that he probably did a larger amount of surveying with his own hands than any other man in England. He did an immense amount of work in connection with Cannock Chase inclosures, and was frequently engaged by the London and North-Western and other railway companies. His integrity and high character were universally acknowledged in all professional relationships. He occupied a seat on the committee of the Birmingham General Hospital, and gave a great amount of time and labour in searching for a suitable site for the new hospital which is shortly to be erected. He was surveyor to the Balsall Heath Local Board from its formation until the end of 1872.

MR. WILLIAM HENRY COWLIN, builder, of Bristol, died suddenly on Sunday morning, at his residence, Combe Dale, Redland. The deceased, a short time ago, recovered from a serious illness, and was able to resume his occupation. He was formerly a decorator and painter, and when a youth he studied at the Fine Arts Academy, in Queen's-road, Bristol, where he won the national bronze medal for drawing at 14 years of age, and afterwards became one of the assistant masters of the School of Art. He subsequently joined his father, to whose business he succeeded in 1834. He was active in carrying out the details in connection with the competition for awards offered by the Bristol Master Builders' Association to apprentices who attended classes at the Merchant Venturers' School. Mr. Cowlin, besides being a member of the Executive of the National Association of Master Builders, was twice president of that body when their annual meetings were held in Bristol. He was for some years chairman of the local Master Builders' Association, and his addresses were invariably marked by ability. Among the members of the trade he was much esteemed for his genial disposition, and his readiness to further any movement which was for the advantage of employers and employed. He was one of the founders and directors of the Builders' Accident Assurance Company. He had restored churches in all parts of the kingdom, and among his local works are the restorations of the Temple Church and the Mayor's Chapel, and the building of the Dock Offices and Capital and Counties Bank. Of late years he was associated in business with two sons, and the firm at one time carried on business in Brunswick-square, on premises now occupied by the Liberal Reform Club, and after leaving there the business was removed to Stratton-street. Mr. Cowlin was 50 years of age. The funeral took place on Tuesday at Arno's Vale Cemetery, and was attended by the members of the City Master Builders' Association, and also by a large number of Freemasons.

DR. RAJENDRALALA MITRA, C.I.E., whose death is just announced, was a distinguished Oriental scholar. For upwards of 40 years Dr. Mitra has been one of the most industrious contributors to the pages of the *Journal* and *Proceedings* of the Asiatic Society of Bengal, the recognised medium of publication at Calcutta of all researches in the history, literature, archæology, and natural science of India and adjacent regions. Among Dr. Mitra's 114 papers published by the society may be mentioned the following:—"On Some Græco-Bactrian Relics from Rawul Pindi" (1862); "On Greek Art in India," and "On Leprosy in Ancient India" (1875); "On the Representation of Foreigners in the Ajanta Frescoes" (1878), Another branch of antiquarian research to which Dr. Mitra devoted much attention was the elucidation of inscriptions (whether on stone or copper) and of ancient coins. His more important works were:—"Buddha Gaya, the Hermitage of Sakya Muni," a monograph on that great temple; and "The Antiquities of Orissa," in two volumes, a work which was the outcome of an archæological mission to Bhuvanes' vara, whither Dr. Mitra was despatched by Government in 1868-69. Dr. Mitra was often consulted by the Government in regard to antiquarian matters, and he was created a Companion of the Indian Empire in 1878.

ON the third reading of the Public Health (London) Bill, an important and regrettable change was made in the measure on the motion of Viscount Cross. By a majority of 19 in a very thin House, it was decided, in spite of the protests of Earl Fortescue, to omit the clause requiring the assent of the Local Government Board for the dismissal of a sanitary inspector. The effect of this will be to give the owner of small property who obtains a seat on a metropolitan vestry or district board power to threaten the inspector of nuisances with dismissal should he make an objectionable report. We sincerely hope that the House of Commons will disagree with this amendment.

SEVERAL applications have been made to erect premises at the corner of East-street and Kennington-road and refused, Mr. Thomas Blashill, the superintending architect to the London County Council, having laid down a line which the promoters regarded as seriously damaging the value of adjoining properties for building purposes. Notice of appeal has been given, and after a delay of five months a Court of Appeal has been appointed to arbitrate under 53 and 54 Vic. London County Council Act, 1890, and has appointed to-day (Friday), at 12 o'clock, at Spring-gardens, for the hearing. This will be the first case tried at the Court of Appeal to be formed under the provisions of the Amending Building Act of last Session.

THE project for the erection of a Great Tower at Wembly is beginning to make visible progress. Mr. A. D. Stewart, to whom, in competition with Messrs. J. M. MacLaren and W. Dunn, was awarded the first premium of 500 guineas in the recent competition, has revised his design in association with Sir B. Baker. The form has been altered from an octagon to a four-sided figure, the height reduced from 1,200ft. to 1,000ft., and the architectural accessories pruned away. Excavations have been made for the foundations at the angles of a square, each side of which is 250ft. long. Each of these cavities will be filled with a monolithic block of cement concrete, 26ft. by 20ft. and 25ft. deep. Of the surrounding estate of 280 acres, one-half will be devoted to building purposes and the other portion is being laid out as a park by Mr. Milner.

MR. CHARLES L. EASTLAKE, F.R.I.B.A., the keeper of the National Gallery, writes to the daily press to condemn the proposal to build the monumental adjunct to Westminster Abbey on the Refectory site. He points out that this area is at present included in the open space at the rear of Ashburnham House, now the property of Westminster School, and that if a chapel were erected there, the light and ventilation of that house, now used as library, reading-room, and classrooms for the school, will be greatly impaired, and the next step would not improbably be a proposition to demolish that highly interesting 17th-century mansion.

THE National Museum of Scottish Antiquities, which has been removed from the Royal Institution at Edinburgh, in which it had been located since 1859, when it was made national property by the Society of Antiquaries of Scotland, has been for some time in process of arrangement, and will shorly be opened to the public, in the east wing of the National Portrait Gallery buildings. The fittings of the new museum have been provided by Parliamentary grant through H.M. Board of Works. The result of the great increase of space and new methods of arrangements is, says the *Scotsman*, that the series of Scottish antiquities is now seen to be a representative collection, national in character, and unsurpassed in scientific interest by any national collection in Europe. The museum is arranged in three divisions—the historic on the ground floor and the prehistoric on the first floor, both of these being Scottish; while the comparative collections, English, Irish, and foreign, are shown on the second floor. On the walls of the lower room, which is of the whole width of the apartment, are displayed portions of painted wooden ceilings, carved doors, and other fittings removed from dismantled Scottish houses. In the showcases in this hall are the smaller articles, so classified as to illustrate the military, ecclesiastical, social, and domestic aspects of ancient Scottish life and manners.

A GERMAN engineer has invented a process whereby the asphalte paving on roads subjected to heavy traffic is rendered almost wearproof. The new system consists of a thin base of concrete, over which a thin layer of asphalte is laid. In the asphalte, ribs of rod-iron are embedded diagonally, so that the asphalte is held in place. It cannot spread in warm weather, nor under the pressure of the heaviest traffic; and, moreover, streets equipped with this ribbed paving require no strengthening when tram-rails are laid down, as is the case with the old asphalte paving. The inventor also claims for the iron-ribbed asphalte that horses get a firmer grip in wet or frosty weather, which, in itself, is a very great advantage over the present. Taking into consideration the constant repairs which asphalte paving requires, this system would probably be found economical in the long run. By means of slips of cardboard inserted between the iron and the asphalte, the latter is prevented from adhering to its metal casing, from which it can be easily removed for repairs if necessary. The inventor of the process is Mr. Chr. Clausen, of Hamburg, and a portion of the roadway at the main entrance to the German Exhibition at West Brompton is laid with the new pavement.

A RECENT departure in pipe-making is the spiral-welded tube manufactured by an East Orange Company. These pipes are made by winding a ribbon of steel or iron spirally, and hammer-welding the overlapping edges. They are said to be the strongest pipes in proportion to weight ever made. As the greatest strength of rolled iron is in the direction of the grain, it is obvious that this plan has decided merits over the ordinary butt-welded tubes with the grain round the pipe. The helical weld acts as a strengthening band, and there is no line of weakness. For various purposes we should think the spiral-welded pipe offers advantages. A table appended to Mr. Burnham's paper on the subject in the *Proceedings* of the Engineers' Club of Philadelphia, shows that for a 6in. pipe of standard grade the proof strength per square inch is 866lb., and for heavy grade 1,106lb. For a 12in. pipe, the standard grade shows a proof-strength per square inch of 553lb., and for extra heavy grade of 893lb.

AT the last meeting of the Hanley Town Council, the General Purposes Committee recommended that, in consideration of his extra services rendered in connection with the erection of Victoria Hall and Quarter Sessions Court, and the alterations to the Town Hall, the borough surveyor (Mr. Joseph Lobley) be allowed two months' leave of absence, and that he be granted the sum of £100. In moving that the recommendation be confirmed, Alderman Bromley said that Mr. Lobley had undertaken a great deal of work for the corporation outside the strict duties of his office, and had thus saved the town a considerable sum in extras and architects' fees. He had well earned the gratuity of £100 which it was proposed to give him. Alderman Charlesworth, in supporting the motion, said the borough was to be congratulated upon having in Mr. Lobley not only an efficient engineer, but a man of architectural skill. His extra services as an architect, not only in connection with the Town Hall, Victoria Hall, and Sessions Court, but at the Shambles and other corporation property, had saved the town, it was estimated, at least £500 or £600. An amendment to the effect that the leave of absence be granted, but not the gratuity, was rejected by 12 votes to 10, and the recommendation of the committee was then confirmed. We understand that Mr. Lobley, who has not previously been absent from his duties for more than a week at a time during more than 20 years' service, sails for New York in the *Etruria* on August 22nd. He visits America mainly with the object of inquiring into the methods by, and cost at, which towns in the States are lighted by electricity, the Hanley Corporation being committed to an expenditure within the next few years of some £30,000 to £40,000 on electric lighting.

Architectural Association, 9, Conduit-street, W.—Members wishing any alteration to be made in their addresses in the Brown Book are requested to communicate with Mr. H. W. Pratt, 6, Duke-street, Adelphi, before August 15th.

ERNEST S. GALE, F. T. W. GOLDSMITH } Hon. Secs.

The Ossett town council have adopted plans prepared by Mr. John Hanson for the extension of its eastern outfall sewage works, and resolved to apply to the Local Government Board for sanction to a loan of £700 for the purpose.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1909.

FRIDAY, AUGUST 7, 1891.

THE SOUTH KENSINGTON MUSEUM COMPETITION.

THE last step towards the completion of the long-neglected buildings of the South Kensington Museum has been taken, and the designs for the work which is to mask the present heterogeneous and unsightly collection of sheds, and to present façades worthy of the importance of a national museum towards Cromwell-road and Exhibition-road, have been on view at the Foreign Office. The existing Gallery for Fabrics, now flanked by a blank wall of brick, and the buildings used as the Library and Gallery of Antique Casts, which project therefrom at right angles, and, eastwards of the latter, the Architectural Courts, form the nucleus of the new buildings which are to face Cromwell-road. Out of nine architects invited to compete for the work eight accepted, of whom we have already published the names, and Mr. Alfred Waterhouse, R.A., was appointed assessor in February last. The site presented a few difficulties. One of these was how to unite the new with the old galleries, to make a central entrance from Cromwell-road worthy of the institution, and side entrances in Exhibition-road, having means of easy access to and communication with the existing galleries and their levels. The acute angle between the two roads had to be considered. The style suggested is one that will harmonise with the present structures of the Department, with the Science School on the west side, and with the Lord President's and Italian Courts internally, as well as with the Natural History Museum in Cromwell-road. The authors have nearly all adopted a recessed centre with projecting wings, a very necessary condition, both for giving space and dignity to the entrance and variety of façade by the breaking up of the long line of frontage. Reviewing the designs, we have seldom seen a more carefully prepared set, many of them marked by great artistic ability, both in the planning of the departments and in the exterior treatment of the façades. Both the conditions kept in view by the committee—namely, that the elevation should harmonise with the adjacent buildings, and the interior be suitable to the requirements of the Department—appear to have been complied with in the selected design by Mr. Aston Webb.

The value and importance of a well-broken frontage towards Cromwell-road has been considered in nearly every design, the main façade showing a recessed centre with end wings, in several plans a quadrantal arrangement having been adopted instead of a square recess. The selected design, "S.K.M.," by Mr. Aston Webb, of which we give a perspective view and the plans of ground and first floors, is artistically arranged in the plan. The main departments are well disposed; the Oriental court, 144ft. by 98ft., with its surrounding galleries and corner pavilions, forms the western wing, having its main length towards Exhibition-road, and the students' exhibition court, 80ft. by 75ft., with an office block in front, forms a corresponding eastern wing towards Cromwell-road; and between these two blocks is a recessed portion comprising the centre entrance-hall, 170ft. by 85ft., a large European court, with lateral courts and galleries devoted to the same class of exhibits, one of these 124ft. by 50ft., and the other 107ft. by 50ft. Both the great European court in the centre and the Oriental court at the western end have their axes at right angles to Cromwell-road, and between them are the European courts, which run longitudinally on each side of the central hall; these, as will be seen, are arranged *en suite* by open colonnades. The courts are top-lighted. The western Oriental court is divided into three central compartments by four columns (see plan) over which are circular domical lanterns, the sides being roofed by narrow-span roofs. The intercommunication between the existing permanent galleries, and between the present Oriental gallery and the Oriental court, has been well managed. The galleries and angle pavilions are skilfully planned, and will form handsome apartments. The clever pen-and-ink perspective of entrance hall, showing a double arcade of circular moulded arches, and the triforium of traceried arches over, surmounted by a roof of circular ribs, illustrates at its best the style selected, which Mr. Aston Webb has carried out in the new Birmingham Law Courts. It combines many of the beauties and artistic capabilities of the Romanesque with the grace and playfulness of the Spanish Renaissance. Repose and dignity mark the well-balanced front towards the Cromwell-road. The square towers, or pavilions, at the angles of the blocks are massive and bold, each surmounted with an octagon upper story and a dome of rather flat Oriental form, which in execution will probably bear a little raising. These square pavilions group quietly and pleasingly with the massive plain-looking square tower, which rises over the main entrance, accentuated at the angles by bold octangular piers, but plain beneath, and only pierced just below a rich corbelling or cornice, above which is a succession of graceful octagon stories, which resemble a little the Spanish tower at Seville. There is much that is elegant and reposeful in this central feature of the main elevation. The square mullioned windows of the lower story of galleries and the round arched windows above of three lights, the rich corbel table or cornice, make a very agreeable *ensemble*. These gallery windows will give plenty of light—a very desirable point in a museum—and they will harmonise with those of the Natural History Museum on the other side of Exhibition-road. A large scale detail of the elevation exhibits some clever and artistic draughtsmanship.

Under the motto "Prince Albert," we have a very poetically-conceived group of buildings, reminding us of some ancient palace. Cleverly-drawn perspectives in Indian ink—one of the exterior and the other of the staircase hall—appear to conjure up in the mind the ruins of some stately edifice in the Venetian Lagoons; the dark and massive features appear to rise out of a wet, shiny pavement or lake. The interior view of staircase looks almost like that of a cathedral in its lofty vault and deepened shadows. These drawings are certainly full of artistic power, though sketchy. There is a decidedly Spanish feeling in the design of the main front. Its long, level line of parapet is broken by two octagonal cupolas and the quadrant recess of centre, and by the square projecting towers which terminate the wings of the lower projecting gallery. This lower story, with its tall, stilted order on pedestals, and the upper story of Ionic pilasters, resembles the façade of the Palace at Granada; the orders have a weak, attenuated look, while the sculptured figures in relief between the lower and entresol range of windows have no structural base, and look out of scale. The plan shows a clever arrangement of square courts and galleries, with a central gallery which forms the main façade above, broken by octagonal halls and cupolas. Cross galleries intersect the main gallery at these points, which, together with the entrance hall and Exhibition-road gallery, inclose three rectangular courts. The one-story gallery facing Cromwell-road surrounds an oblong court. The centre is set back by quadrants forming an open loggia. The angle at the corner of main façades is square, and a very lofty tower of not very elegant profile rises above the staircase at end of central gallery. A large-scale coloured drawing of one of the main cupolas, showing the open iron cone, is exhibited. The grouping of towers and low south gallery is artistic; the courts and galleries are top-lighted. The author of this design is Mr. John Belcher.

We pass from this very elaborate example of Spanish Renaissance to a design of extreme Classic severity, "English Tradition," a Greek Classic treatment, by Mr. Mervyn Macartney. The author has clearly thought that a museum should be top-lighted, and that ample wall-space should be given to the courts and galleries of a museum; hence he has reduced fenestration to a minimum, as being inconsistent. Upon this principle, Mr. Macartney's plan is intelligible. He has a central circular-domed court as an index hall forming the middle block of the Cromwell-road front. A longitudinal gallery connects it right and left with the wings. The N.W., S.W. courts are surrounded by arcades and outer galleries, and these form a very symmetrical arrangement. The second-floor plan shows a suite of picture galleries surrounding the courts. The elevation towards Cromwell-road consists of three massive blocks, each with projecting angle blocks *in antis*, with pediments; a lofty attic crowns each of the main blocks. The courts are top-lighted by a series of span roofs of glass, and a tower rises in the centre of the façade towards Exhibition-road. The effect of such a building externally would be rather heavy and depressing in a neighbourhood surrounded by buildings of ornate Romanesque and elaborate Renaissance features.

"ΤΕΧΝΗ ΤΥΧΗΝ ΕΣΤΕΡΞΕ ΚΑΙΤΥΧΗ ΤΕΧΝΗΝ," we believe by Mr. W. Young, is a very florid design in Spanish Renaissance of two orders, the lower order much stilted. The author has imparted to his detail and ornamentation something of the Early Plateresque style of Spain, which derived much from Moorish fancy. A pencil elevation of the façade shows some exuberant detail in brick and terracotta. The plan has a recessed centre and well-broken wings, with corner pavilions projecting, two western square courts, 102ft. across each way, and a central entrance in Cromwell-road, leading to a centre gallery, which is lighted by cloister courts. The acute angle of the site is followed on the façades, and a circular recess with fountain is shown at the corner. The view of entrance hall shows some good detail of arches and frieze in terracotta, open arcading over, and a flat coffered ceiling.

"Chi si Contenta Gode," we believe by Mr. T. G. Jackson, is a free Renaissance treatment, with a corner tower of rather Spanish character, a central tower with dome over the centre block, which is recessed, and corner pavilions, which relieve the main façade from monotony. The plan conforms to the acute angle. There are three courts at the Exhibition-road end, with galleries round. A wide, recessed centre, with quadrantal-shaped galleries, emphasise the central block, and a tower entrance leads to a central court, wide and oblong, between the old science library and the antique casts gallery. A sculptured frieze runs round the centre block, and there is a loggia of open arches. The tower is octagonal above, and is surmounted by a cupola. A perspective of the central court shows circular iron ribs and open-work spandrels, carried by columns and arches, with side lean-to aisles. The roofs of courts are mainly of iron. The exterior view looks rather hard; but the details of one of

the towers and bays indicate careful study in the materials—red brick and terracotta.

A very beautifully drawn ink perspective illustrates "Ars Longa Tempus Breve," by Mr. Emerson, in which design of red brick and terracotta Spanish features and details have been cleverly combined. The centre is recessed, and the wings are emphasised by projections flanked by circular stair turrets at the angles, shown by a half-inch scale elevation. Detached Corinthian columns of terracotta stand in couples upon a basement of the same material in courses, between which coupled columns are windows with semicircular heads on the first floor. At the corner the acute angle is cleverly concealed by an octagon-ended stair projection, with raking lines of ornament, which is made a feature. A deep frieze of figures in relief is introduced below the cornice. The elevation towards Cromwell-road is dignified and well broken up. The entrance has a *porte cochère*, and there is a screen connecting the wings in front of the recessed centre. In plan the blocks conform to the acute angle of boundary, the inequalities being thrown into areas for light. There are north-west and west courts with galleries, a central octagonal court, domed top and side-lighted by areas between the old galleries, and an east court for students' competition works. Over the west entrance in Exhibition-road is a tower. The interior perspective of west court has a domical roof of glass and iron, resting on four semi-domes; the latter spring from beams thrown across the angles of court; but the arrangement has too much the *tour de force* effect to be pleasing, and the angles in soffit of ceiling filled with circular panels are awkward. Two tiers of arcades on coupled columns surround the sides of court. One objection to the plan is the small galleries created by dividing by transverse walls the main areas round the courts. The entrance court and central octagon and the recessed archway over the balcony are handsome features.

"Verona" (Messrs. Deane and Sons) is another well-balanced arrangement of blocks, a wide centre vestibule recessed with quadrant ends flanked by imposing towers, and two wings with corner turrets. The three blocks have domical roofs; the angle between the two façades has been ingeniously disguised by a lofty tower, which forms a staircase. A large octagonal Oriental court, with two tiers of arcades with galleries on both sides, is a feature in this plan, and is made rather ingeniously to connect with the galleries on either side by a circular vestibule, leaving irregular areas for light and air. The central court and staircase is roofed by a square domical lantern admitting light, supported on deep coves, and the octagonal Oriental court has iron ribs and lantern, forming a dome-shaped roof over the centre. There is much dignity and repose in the grouping of the three pavilion-shaped blocks, and in the towers and details, which are in the Italian Renaissance style.

An arrow in shield (Mr. T. E. Collcutt) is another design of a less particular phase of Renaissance, and considerably tinged by Oriental features. The principal feature is a prodigious dome which crowns the central hall, surrounded by two orders of coupled columns and sub-arches and an arcade above. The dome resembles that of the Pantheon, and has an "eye" for light at the crown, but its proportions are crushing. Corner towers support the centre. The plan is square at the south-west angle, and has two courts and galleries, and there are corner pavilions to the wings. The author has studied to harmonise the building with the present surroundings, and there is some dignity in the treatment of the three blocks. The students' court and galleries are well arranged for separate exhibitions of their works. The author estimates his design at from £370,000 to £390,000. The cost of the design which was finally approved on Thursday is estimated at from £300,000 to £400,000. Our present illustration will be followed by those of the other designs.

UTILITARIAN ARCHITECTURE.

MODERN experiments are becoming so numerous and pressing, that the problem is not to follow a style or a precedent, but how to build up to date—how to embody all that is absolutely needed—all the improvements of the engineer, the inventor, and manufacturer of new appliances. The old academical or classical formulæ, which set before the architect canons and rules, can only be accepted in the case of monumental buildings, in which category we may include churches, structures commemorating actions or individuals, and those public edifices which are more decorative and monumental than designed for utilitarian purposes. Such a division is becoming more apparent every day; we seem to be approaching an epoch in the history of architecture when a line between the decorative and utilitarian styles must be drawn; when a phase of what might be called engineering-architecture will be developed. Civil engineering as a special branch of construction caused a breach in architecture early in the present century; but the division was a broad one. A new sort of structures was called for, and a class of specialists arose who had made iron construction a particular study. The architect's domain was encroached upon slightly. Both branches of the constructive art have since gone on extending their boundaries; the engineer's profession now embraces a number of distinct classes of practice, as those of the hydraulic, the railway, the electrical, and the sanitary engineer. The architectural profession comprises also those who follow certain special branches; but the distinction to which we now refer is a further subdivision created by the natural hostility between the artistic and the utilitarian, which we see in contrasting our great public edifices with those erected for commercial, hygienic, and charitable purposes. Take the first; the commercial spirit is defiantly expressed in the very elevation of our large street establishment; what is left for the architect to do is simply to arrange the proportion, to adjust the width of piers between the huge sheets of plate-glass windows, and to decorate the façade. All within is sheer engineering or building work: floors and partitions are composed of a framework of iron stanchions, columns, and girders; the side walls are plain structures of brick, and the only pretence to architecture is the façade, which is a mere front screen. We cannot dignify by the name of architecture the clothing or decoration, such as it is, of the internal walls. Absolute requirements and utility have governed their construction and position; the whole structure is one of floors, lifts, and staircases, for which the skill of the engineer or builder is required. Even the fittings, the heating, the gasfittings, the "wiring" for the electric light and bells, and the ventilating arrangements come within the engineer's province. Interiors of this class are no longer proportioned by the rules of Vitruvius or Palladio; the rooms are not designed after certain geometrical or harmonic proportions, but made to suit the requirements of business. Instead of the studies of the artist, calculations and tests of the strength of columns and girders, modes of constructing fireproof floors, and of arranging apparatus are required. It would be of little use to spend much time in designing cornices, panels, and other interior details in buildings which are destined to be frequently altered or reconstructed to meet the exigencies of trade. In a like manner where is the scope for architectural taste or invention in a technical school or a workhouse, a hospital, or lodging-houses built in flats? A very different kind of training and experience is needed by the architect in designing and carrying out these structures to that necessary in the design, say, of a church or a mansion. In the first case architectural design is confined to the mere shell or façade; it is not the motive but a merely subsidiary function in arranging a façade, of clothing the structure; it is completely subordinate to the utilitarian purpose. In the latter the art is the primary motive of the design, and arranges and governs the whole building. It gives, so to speak, shape to the external masses: it groups them and models the whole design. No one but an architect can realise the difference between the design of a monument, or town hall, and the design, say, of a set of baths and washhouses or a market. Artistic purpose governs in the one; the architect has to conceive a plan, a proportion, an outline of mass and feature, a scheme of decoration and detail; but in the latter, the engineering structure, the utilitarian requirements are of the first importance. The danger is that these requirements, so exacting and so technical, are prejudicial to the artist by inducing him to relegate them to engineers and specialists. Thus the iron roofing of columns, and galleries of a market are supplied by firms who undertake the design and details, who have made a particular study of roofs and ventilating arrangements. The architect hands over the structural matters to the firm—is it not more true to say the structure is handed over to them?—for which they prepare a scheme and write the specifications which are accepted. The design is worked "down" to these provisions—that is, the architect receives the engineer's scheme, and then completes his designs or elevations. Another example of the same overruling of the utilitarian is to be noticed in schemes of ventilation applied to public halls, courts, chambers, and law courts. The section of the roofs must be made so as to permit of the introduction of air trunks and shafts; must be the joint work of the architect and ventilating manufacturer. They must consult together, or the architect must give *carte blanche* to the latter, or contrariwise the manufacturer must do the best he can to introduce his apparatus. Heating by hot water and steam, or air, the patented forms of boilers and coils and radiators, inlets, &c., have an appreciable effect on the design of the architect; he cannot do as he likes, but must consult those who have made heating a special[illegible]. So with the electric lighting require[illegible] plans and specifications must be prepared to meet them, and provisions made.

All these matters are, we say, making the architect's labour more technical and laborious—that is, if he conscientiously tries to keep himself abreast of them; or, on the other hand, these requirements are making it more easy for specialists to begin to set up special branches of utilitarian architecture. Directly a class of building begins to partake more of an engineering character than the architectural, there is an opportunity at once given to the specialist to make it a business. Look at the horticultural builder, the farm architect, the washhouse and laundry engineer: they have already made these branches of building specialities. It is for the profession to decide for themselves if this sort of subdivision of their art is to go on; if they are content to sit still and see certain developments of practical architecture taken up by individuals who know only the utilitarian requirements, but are very ignorant of architecture—look, for instance, at many of our markets and farm buildings.

ourse, the public want certain require-ents carried out with efficiency and scientific rrectness, and if the architect cannot ndertake to do so, he must not be surprised the outside specialist is called in. In these mmercial and practical days utilitarian id technical requirements are constantly croaching on the purely architectural ovince of the practitioner, and unless he is epared to come to terms of agreement with ie invading forces of the engineer and ecialist, he must by degrees surrender his sition and even the citadel of his influence them. There can be now no longer any spect of his facing the foes and opposing eir advance. Terms of compromise can yet made.

Sanitary, structural, and physical science, cluding the various forms of specialism hich threaten to break up and disintegrate e practice of architecture in the future, are ithin the reach of the practitioner if he will ly take advantage of them. If he refuses, hers are willing and ready to apply them special wants, as engineers and sanitary perts who now prepare designs for special uildings like baths and wash-houses, farm uildings, factories, and the like. If the chitect is content to allow this constant croachment upon his domains, he will find r-and-by a further division of architecture s taken place, and specialists will appear ady to undertake all buildings in which ecial scientific knowledge and experience e required. This must necessarily be the sult. Two causes are helping to create this vision: the apathy of the profession, in not aking themselves masters of particular re-irements, and the demand of the public to tain the latest and most approved buildings id appliances they can. The true artist's skill to give form to various materials that ve forced themselves upon attention, and suggest methods of arrangement to pre-nt unsightly applications. The canons of t applied to the older materials of build-gs, such as brick, stone, and marble, have t to be extended to concrete and iron. ew wants of large communities, like baths, ash-houses, and polytechnics, still call gently for some art in their construction. he public first look for the improved aterial and the new agency—they will have in spite of art; but after it comes the sire for a more artistic treatment. Utility st, then art, has been the natural order of l architectural construction; the pity is at the artist has not consulted this order, it has allowed the expert to remain master the former position—hence the divorce at has taken place.

NONCONFORMIST CHURCH BUILDING.*

By James Cubitt.

INTRODUCTION.

N the Nonconformist church-building of to-day it is easy to note two very fferent ideals. They may be called, for dis-nction, the "congregational" ideal and the ecclesiastical" ideal. There is something be said for each of them: and yet neither, itself, is quite perfect or satisfying.

The "congregational" ideal concerns elf most with practical and material fit-ss. It demands that its buildings shall adapted "for preaching, and for worship the congregation." It asks that every-ne shall see and hear the preacher, without nscious effort. It insists that the sermon shall be heard without strain, either of the rs of the auditory, or of the voice of the inister." It desires, too, that "the speaker all be in vital contact with his hearers. oquence, it has been said, is in the udience: the preacher's inspiration is not his theme alone, but in the manifest sym-thy with it—the kindling eyes and inter-ested countenances of the people. If, there-fore, he is separated from them by any such space as prevents his easily catching these, his inspiration must be entirely subjective, and necessarily partial." And, the prayers being usually extemporaneous and not liturgical, "the necessity for their being easily heard is greater, even, than in the case of the preaching. Thus, except during singing, the congregation throughout are entirely dependent on hearing the words of the minister." And the singing itself is not choral, but congregational. It is only led by the choir. There is no part of it in which the congregation does not join. The choir "should, therefore, be in the congre-gation and of it." Such, as stated by a high authority, are the conditions of the case on the "congregational" ideal; and from these conditions, according to that ideal, the whole scheme and design of a Nonconformist church ought to spring.

Those Nonconformists who, on the other hand, are attracted by the "ecclesiastical" ideal, do not deny the importance of these practical requirements. They wish them to be fulfilled; but—to be fulfilled in a building as much like an Anglican church as possible. They look for a high standard in the accessories of public worship—in architec-tecture and music and the arts—and they find it there. And they point out that these accessories, as daily experience shows, have a real and powerful influence on the mind. To gain this influence, they wish to copy the buildings which produce it; and hence arise many failures. It is so easy to imitate the form, and yet to lose the spirit. And at best the imitation can hardly be close. The form and arrangement of most ancient churches are very unsuitable to Nonconformist purposes. The long nave arcades, with their piers, are, for these purposes, greatly in the way. Yet to retain them and thin down the columns—as Nonconformist attempts to realise the "ecclesiastical" ideal are so fond of doing—is to lose their effect of per-manence and repose, without losing much of their physical obstructiveness. So it is with other points in the Anglican church plan; and the result of following it is either to keep most of its inconveniences, or to lose most of its characteristic expression.

Neither the "congregational" ideal nor the "ecclesiastical" one leads to success if it is followed too exclusively. Each has something to learn from the other. Con-venience and material utility are indis-pensable, no doubt. But there is no advance to be made by seeking them solely, and by being blind to everything else. To do this is to be left behind as the world moves on. Artistic knowledge and cultured tastes are not now confined to what are sometimes called the upper classes. Year by year they become commoner and commoner; if they did not, public education would stand con-demned by its own results. To build with-out reference to them is to get out of touch with our contemporaries. A generation ago it may, in one sense, have answered to put up a structure with the proportions of a barn—to fit it up with three galleries and a plat-form, and then, by adding some tracery and carving, and perhaps a too-ambitious spire, "to hide with ornament the want of art." Those days are over; it is necessary now to begin further back, and to think about the form and proportions of the structure itself.

So much for the artistic side of the subject. But, turning again to its practical one, the "congregational" ideal is undoubtedly right in the main conditions it lays down. Non-conformist churches must, beyond all ques-tion, be built to see and hear in. The time may come for most of them, as it has already come for some, when they will not stand empty from Sunday to Sunday. Already we hear of a future in which "church work will have to be as varied as human nature"; in which there will be much other teaching besides that of the sermon, and many other services besides those of prayers and hymns. All this implies more—not less—regard to material utility; and the problem is, there-fore, to get this, and yet to get more impressiveness, more elevation of character, along with it. It remains, in short, to reconcile the "congregational" ideal with the "ecclesiastical" one, and to show that each has been wise in its aim, if neither as yet has been quite successful in its means.

The successive steps which are usually necessary in the erection of a Nonconformist church may be arranged under the following heads:—

I. Choice of a Site.
II. Giving Instructions for Designs.
III. Selection of a Design.
IV. Appointment of a Builder, and Execution of the Works.

CHAPTER I.—CHOICE OF A SITE.

Very much depends on the choice of a site. Some sites are dear at a gift. Such are commonly those which lie far below the adjoining street, so that a vast quantity of brickwork is wasted, or nearly wasted, before the floor-level is reached. Schools, perhaps, are put under the church; but gloomy and unhealthy schools they are in most cases. Then there are sites which slope steeply upwards from the street. These, in addition to a waste of brickwork, involve the inconvenience of many steps for access to the building, unless the back of it is partly underground. Then there are sites with bad foundations, where the walls have to go, perhaps, half as far below ground as above. There are sites in which it is neces-sary to under-pin adjacent buildings, or even to keep up adjacent ground by retain-ing walls; and sites in which it is hard to get light and air enough, or in which there would be a risk of law-suits through shutting out light and air from neighbouring buildings. There are unhealthy sites, sodden with sewage or stable drainage, or filled up with the refuse of dustbins; and there are sites, again, so placed that they can hardly be drained. No doubt faultless sites are rare, like other faultless things, and people who want to build in a particular district must build where they can. There are ways of dealing with most of the difficulties named; but these ways cost money, and a good site is the first condition for an economical building.

It does not follow, however, that a site ought to be perfectly level in surface, or per-fectly regular in shape. Irregularly-shaped sites often produce the mostly artistic, and not rarely the most conveniently-planned, buildings. A slight fall from front to back of the ground, or from side to side, may be turned to account in the arrangement of the church. Amongst the most difficult sites to deal with for congregational purposes are the long and narrow ones, particularly if a space has to be taken off the sides of the site to allow of light. A long, narrow site leads, in this case, to a long, narrow building, and this is not the sort of building best suited to Nonconformist worship.

Corner sites are good, and would be better if those who purchase them did not almost invariably want to fill up the corner with a tower and spire. Much may often be gained both in internal and external effect by put-ting the side of the church, rather than its gable end, next the main road. More light is thus obtained within, and more picturesque-ness without. Aspect, indeed, is a matter which deserves greater attention than it usually gets. When the principal façade faces the sunless north, it is hard to keep it from looking gloomy and repellent. Any other aspect is better, and especially those which are partly or wholly south or west.

The necessary size for a site depends, of course, not only on the number of people which the church is intended to seat, but on the question whether they are all to be seated

* All rights reserved.

in the ground floor area, or whether many of them are to be put in galleries. And if a number of other buildings besides the church are to be put on the site—such as Sunday-schools, classrooms, lecture-halls, &c.—the required area will probably have to be doubled. A plot 120ft. square will contain a church for 800 or more, together with schools and classrooms for 500, a caretaker's house and other buildings, arranged without crowding. But where land is valuable, it is often necessary to get the same accommodation on a much smaller space, though if room can be afforded, it is more satisfactory to keep the various buildings still farther from each other and from the street.

PRICES.—XIII.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

CITY OF LONDON:—Commissioners of Sewers have adopted the following charges for permission to use hoardings for the purpose of advertising:—

For *first-class* streets, and the return frontages thereto:—

		£	s.	d.
For the first six months, per foot super. per month		0	0	4
Afterwards	ditto	0	0	6
All other streets:—				
For the first six months	ditto	0	0	2
Afterwards	ditto	0	0	3

The following is a list of *first-class* streets:—Adelaide-place, Aldgate, Aldersgate-street, Aldgate High-street, Barbican, Beech-street, Bishopsgate-street (Within and Without), Blackfriars Bridge Approach, Blomfield-street, Cannon-street, Chancery-lane, Charterhouse-street, Cheapside, Cornhill, Eastcheap, Farringdon-street, Fenchurch-street, Finsbury-pavement, Fleet-street, Fore-street, Gresham-street, Gracechurch-street, Great Tower-street, Holborn, Houndsditch, King William-street, King-street, Cheapside, Leadenhall-street, Liverpool-street, London Wall, Long-lane, Lombard-street, Lothbury, Lower Thames-street, Ludgate-hill, Ludgate-circus, Mansion House-street, Moorgate-street, New Bridge-street, New Broad-street, Newgate-street, Old Broad-street, Poultry, Princes-street, Queen-street-place, Queen Victoria-street, St. Martin's-le-Grand, St. Andrew-street, St. Bride-street, St. Paul's Churchyard, Threadneedle-street, Throgmorton-street, Upper Thames-street, Victoria Embankment Approach, West Smithfield.

Based upon these charges, a hoarding in a first-class street having an 18ft. frontage and two 5ft. returns, and assuming it to be covered with advertisements up to a height of 40ft., will, at 4d. per foot super. per month, amount to £18 13s. 4d., and for six months £112; and for a similar hoarding in other streets at 2d. per foot per month, the charge for a hoarding for the first month would be £9 6s. 8d., and for six months £56.

There will be a constant supervision of the hoards to see that the superficial space that is licensed and paid for is not exceeded.

The present maximum height that a hoard will be licensed for is 40ft., though the height may be increased by order of the Commissioners if they think it wise to do so later on.

Section 5 of the Advertising Stations (Rating) Act, 1889, gives the Commissioners as the local authority under the Sewers Act when granting a license for hoards upon or over the public way, or upon or over their own property, power to include in such license a condition prohibiting the affixing of any advertisements to such hoarding, or sanctioning the affixing of advertisements thereto on payment and on such conditions as the commissioners may determine.

The penalty which may be recovered by the Commissioners for using any hoard otherwise than as permitted by the license is not exceeding £5, with a farther sum of 40s. per day after notice in writing to discontinue such use.

The following are the charges made and suggested in the various districts given:—

St. George the Martyr (Southwark):—

Per yard super. per week 0 0 1

* All rights reserved by the Author.

St. Saviour's Board of Works:—

		£	s.	d.
For first-class streets...	per yard super. per week	0	0	1½
Second-class ditto.....	ditto	0	0	1
Third-class ditto.....	ditto	0	0	0½

St. Giles' Board:—

Main thoroughfares...	per yard super. per month	0	1	6
Other ditto ...	ditto	0	0	9

St. Martin's-in-the-Fields:—

This vestry has decided to prohibit the affixing of advertisements on hoardings.

Holborn Board:—

Main thoroughfares..	per yard super. per month	0	1	6
Other streets	ditto	0	0	9

Fractions of a yard charged as a yard.

Lambeth:—

Per yard super. per week 0 0 1

Plumstead Board:—

Per week 0 2 6

No advertisements allowed unless an extra sum of 10s. be paid on granting license, and 2s. 6d. for every week beyond first four weeks, the Board reserving the right to require additional fees in any particular case.

St. Margaret and St. John, Westminster:—

No scale. Charge calculated on rent received, upon which the amount in the £ of the current rates, payable monthly in advance, is charged. Where the licensee refuses to disclose receipts, he is charged on the basis of the ascertained rent in similar cases.

St. James, Westminster:—

Per foot super. per week.....1d. to 2d.

No uniform scale has been adopted; but each application is separately considered. The charges vary approximately from 1d. to 2d. per foot super. per week.

St. John's, Hampstead:—

Per foot super. per month 0 0 1

St. Luke's, Middlesex:—

First class	per yard super. per month	0	0	2
Second class	ditto	0	0	1
Third class	ditto	0	0	½

Greenwich Board:—

Per week 0 2 6

(This is inclusive for every 20ft., more or less. Fractions of a week reckoned as a week.)

Wandsworth Board:—

No scale. Each application considered separately.

St. George's, Hanover-square:—

For the first six months in first-class streets	per month	0	0	6
Afterwards	ditto	0	0	9
For the first three months for other streets	ditto	0	0	2
For the second ditto	ditto	0	0	3
For the third ditto	ditto	0	0	4

Bermondsey:—

Per yard super. per month..... 0 0 2

Hackney Board:—

For every 100ft. run main roads	per month	0	2	0
Ditto side streets	ditto	0	1	0

(These rates adopted for six months.)

Paddington:—

Per foot super. per month 0 0 1

St. Olave's Board:—

For first rate streets...	per yard lineal per week	0	0	3
Ditto for second rate...	ditto	0	0	1½

St. Mary, Battersea:—

Main streets... per yard lineal...	(time not stated)	0	1	0
For other streets		0	0	9

Strand Board:—

Licenses granted on condition that no advertisements shall be affixed to hoarding.

Hammersmith:—

Advertising prohibited.

St. Pancras:—

First-class streets	per yard	0	1	0
Second ditto	ditto	0	0	6

(No time stated. Charges tentative for six months.)

St. Giles', Camberwell:—

First class streets...	per yard super. per month	0	0	6
Second class ditto...	ditto	0	0	4

Whitechapel Board:—

Main roads	per yard super. per month	0	0	6
All other roads.....	ditto	0	0	3

Lewisham Board:—

No scale adopted. Advertisements prohibited, unless by special permission.

St. James and St. John, Clerkenwell:—

Licensing fees to be increased to meet the rating of hoardings. No scale adopted.

Poplar Board:—

Inclusive charge provided hoarding is not larger than 16ft. or higher than 12ft. for first-class streets ..... per month £ s. 0 1(

(For every additional 12ft. in height, 10s. and 5s respectively for first and second-class streets.)

Second-class streets .....per month 0 1

St. Mary Abbotts', Kensington:—

No fixed scale is yet adopted. Each application is treated on its merits.

Chelsea:—

For hoardings from 10ft. long and 20ft. high to 100ft. long and over 40ft. high, in streets in which the rateable value of houses is under £50.....per week 1s. to 8

(A like sum to be charged for every additional £50 able value. This is a temporary arrangement.)

Bethnal Green Vestry:—

Have not yet come to a definite conclusion

THE ARCHITECTURAL ASSOCIATION EXCURSION IN SHROPSHIRE.

[WITH LITHOGRAPHIC AND OTHER ILLUSTRATIONS.]

NEXT Monday the proceedings of this Society's annual excursion will commence at Shrewsbury, in accordance with the programme which we printed in our issue for July 24th last, and we shall commence an illustrated report of the proceedings in our next issue. The district to be visited, although it by no means includes all that is worth seeing in the way of Domestic work, for which the county has always been so famous, at any rate furnishes clearly quite sufficient for the proper work of one week, if the buildings are to be sketched and studied with anything like the care which they unquestionably deserve. Few parts of England have influenced the best modern Domestic work of the day more directly than Shropshire, with its choice and comparatively unknown examples of timber building, and its Renaissance work in brick and stone. Park Hall, near Oswestry*, and Pitchford Hall, to be seen on Friday, are among the largest specimens of what is called the "magpie" style of construction; while Moreton Corbet and Condover may be classed among the leading examples of the Elizabethan and English Renaissance type of design, as represented in the revival which recent years have seen in Shropshire by the late W. Eden Nesfield, at Cloverley Hall†; "Adcote," by Mr. R. Norman Shaw, R.A.‡; and "Peverey," § now building from the designs of Mr. Aston Webb, near Baschurch—three works of considerable character, and of the first importance. Turning back further in the historic page of architectural art as seen in the Marches of the Welsh border country, we are presented with even more notable and conspicuous instances of Domestic building still existing in almost unique completeness, although dating from the 13th century. We refer to the delightful castle at Stokesay and the rather later manor-house at Acton Burnell—a building which was designed by the same architect as the famous Bishop's Palace at Wells, in Somersetshire. For a Perpendicular house of equal interest, Shropshire can still boast the fairly perfect specimen at Wenlock, where the prior's lodging, adjoining the ruins of the Priory, is one of the few entire houses now standing of that period. Of all these and more less-celebrated buildings none, however, present such considerable and paramount interest as Stokesay Castle, which for its early date and continuity of style stands alone, having neither suffered restoration nor material alteration in mediæval or modern times. The banqueting-hall is hardly to be matched elsewhere, even among the handsomest old national mansions of later date. The two towers of the castle most materially increase its remarkably imposing appearance externally, besides adding a quaintness and singularity to the plan. We have, therefore, chosen this specimen of Salopian architecture for a leading place among our illustrations to-day, giving a general view from the N.E. of the entire group as seen from the churchyard, and a second sketch representing the richly-timbered gatehouse, with the tower of Stokesay Church in the background of the picture. The plan printed in the corner of the lower drawing serves as a key illustrative of the buildings as they now exist. Two entirely different sketches of the castle will be found in the BUILDING NEWS for Sept. 7, 1888.

Stoke, to speak in brief outline of its history, belonged to Ældred of Edric Sylvaticus at the Conquest; but when he joined the Welsh rebellion, Roger de Montgomery had it given him. He died, and the Crown bestowed the property on Walter de Lacy, from whom the Say family received it. Its name of Stokesay first appears in a grant of the advowson to Haughmond Abbey in 1156. In 1498 the last of the Ludlow family held the castle, which then by marriage passed to the Vernons of Haddon Hall, in Derbyshire. Members of that illustrious family lived at Stokesay till 1607, when the Mainwarings bought it, and then the Cravens became the owners, and remained so till some five-and-twenty years ago, when Mr. Allcroft, of Stokesay Court, bought the place. Since 1706 no one has really lived in the house, which for some while was occupied as farm buildings and partly as a smithy. The castle is situated in a most beautifully-wooded valley, a short walk from the Craven Arms Railway Station, on the line between Shrewsbury and Ludlow. As will be seen by a reference to the plan, the buildings and courtyard are surrounded by a moat about 20ft. wide, the only entrance being by way of the Elizabethan gatehouse. A Gothic canopied well-house once stood in the courtyard; but this, like some other timber buildings (their position is dotted on our plan), has been removed. The southern tower, the only part of the buildings having any really serious suitability for defence, is a remarkable structure in three stories of well-proportioned elevation, and taking the shape of an irregular polygon on plan, presenting on the exterior front a double octagonal façade. Ten years ago, for some inscrutable reason, the pyramidal roof which crowned this tower, rising behind the embrasures, and partaking of the irregularity of their plan, was taken down, and a lead flat at great cost was substituted. This roof was in capital repair, and was certainly unique among the secular buildings of England. The tower is connected with the main building by a covered passage, and a small staircase built in the thickness of the tower walls leads to the upper floors. The windows in the tower have seats in the sills, with shutters inside, and where they have been removed from the other openings the hinges and catches may still be seen. The hall runs the whole height of the building between the towers, and has handsome transomed windows with trefoiled lights. Glass was inserted for the upper openings, but only shutters were used below. The heavy and well-smoked timbers of the massive double collar-beam roof rest on stone corbels, enriched with good Early English mouldings. A shoulder-headed door at the south end of the hall leads to the lower apartments of that wing. The north wing rooms are reached by a

* See BUILDING NEWS, Feb. 27th, 1891, for view of Park Hall, and details.

† See BUILDING NEWS, June 3rd, 1881, and July 17th, 1891.

‡ See BUILDING NEWS, Dec. 20th, 1878.

§ See BUILDING NEWS, May 16th, 1890.

solid timber staircase, and their upper part is built of wood and plaster, resting on walls of great thickness, with oversailing brackets, as seen in the picture. This upper timber-work was added probably in the 16th century. At the other end of the building an external staircase communicates with the withdrawing-room, where the primitive style of the apartment is masked by some rich 17th-century panelling, and above the projecting archway of the fireplace a florid overmantel in gorgeous elaboration of carving, heightened with gilding and the remnants of colour, forms a great feature. We publish a carefully-measured drawing of it to scale, kindly contributed by Mr. Arthur Marshall, of Nottingham. Above the timber-built gatehouse archway is a quaint sculpture, illustrative of the fall of Adam, and other carvings worth noticing. The church, which served as a chapel to the castle, presents a commonplace, re-edified edition of a small so-called "Norman" church, built in 1664. High dark oak pews fill the nave, and have old hinges and enrichments, while in the chancel is a canopied Jacobean pew, and near it is a good old carved English chair. The lithographic page of "Shropshire Studies" which we publish to-day are from the sketchbook of Mr. Geo. P. Bankart, of Leicester, and include some eminently typical specimens of detail. The timber gable from the south transept of Condover Church is particularly interesting, and the Decorated traceried doors from the porch of St. Mary's, Shrewsbury, are equally so. The houses in Dog Pole and in Butcher's-row, Shrewsbury, are very characteristic, like the gable from the Holy Cross in the same town. The Raven Inn at Much Wenlock is graced with the curious old wrought-iron sign here illustrated, and surmounted by the "Wise Old Bird." The half-timber house with the big bay window at Wenlock is suggestive, and the detail of the fenestration of the cloister to the prior's house at the abbey is a welcome addition to the sheet, and so is the chimneypiece drawn from Ludlow. Our remaining illustrations show the "Reader's House" at Ludlow, the "Gatehouse" and Market or Guild Hall at Much Wenlock, over its timber piazza, together with some more timber gables and fronts in the Square and High-street, Shrewsbury. These admirable sketches are from the skilful pen of Mr. Ed. Hodkinson, of Chester. A dashingly-drawn double-page of sketches by Mr. Oliver Baker from the neighbourhood of Ludlow was published in the Building News for Sept. 21, 1888, when we reviewed Mr. G. Woolley's indispensable book about the town. Other drawings of Salopian buildings by Mr. Bankart were given by us in our pages for March 7th, May 30th, and Oct. 17th, 1890.

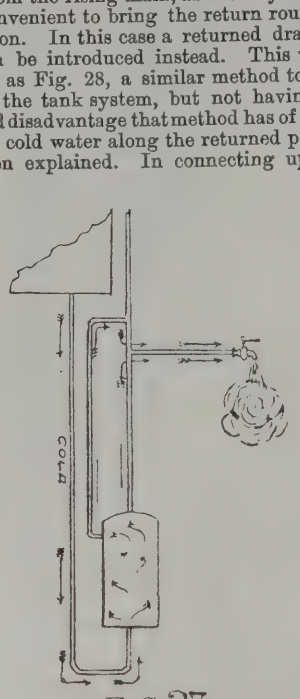
HOT-WATER ENGINEERING.—IX.

Supply of Hot Water for Baths and Domestic Purposes.

The Cylinder System (*continued*).

In the last paper it was particularly recommended that the secondary return (the return of the rising main) be brought into the cylinder near the top; for as the water proceeds *up* this pipe to a tap, when it is opened, just as freely as it does up the rising main itself, it is necessary to be cautious as to where it is connected, and on no account must it be anywhere near the cool water in the apparatus, or where the cold water flows in. By connecting it near the top of the cylinder, about 6 to 8in. down the side, we thus get both the pipes that are in communication with the taps starting from a source where the hottest water always is to be found, be the quantity small or large. When a tap is opened the water will proceed as indicated by the arrows in Fig. 27, a direction similar to that illustrated in the last paper; but note from whence the water starts up the secondary return. This water comes from the top of the cylinder, where it is hot, and not from the bottom, where it is always cold, or cold is always flowing in. It cannot be repeated too often that an apparatus may fail entirely because the hot water cannot be drawn from within it. It takes a higher degree of skill to avoid this than it does to get the water hot. This latter is so easily effected by providing a boiler fully powerful.

In the last paper it was shown that the rising main could be carried up around one portion of the building, returning by a different route, so as to pass by all the positions that taps were needed in—this being done to avoid long single draw-off services. Sometimes only one tap is situated a distance from the rising main, and it may then be found inconvenient to bring the return round in this direction. In this case a returned draw-off service can be introduced instead. This would be effected as Fig. 28, a similar method to that adopted in the tank system, but not having the pronounced disadvantage that method has of drawing cool or cold water along the returned portion as has been explained. In connecting up this



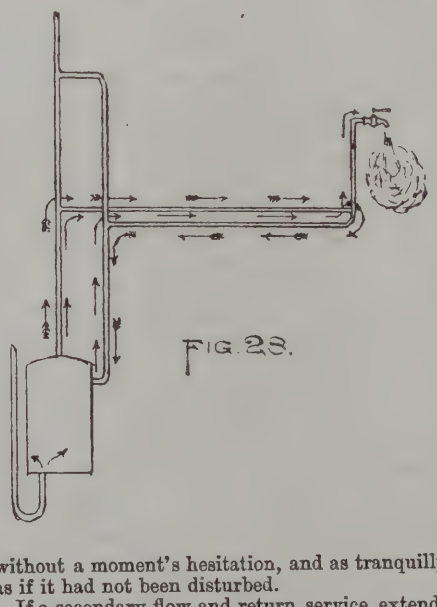


FIG. 27.

returned draw-off service the secondary flow and return, from which it is taken, would retain the same features as last explained, and a glance at the last illustration will make it clear that this returned draw-off service will not only circulate properly, but will provide hot water so long as any remains in the apparatus. The feathered arrows in this drawing show the direction the water takes when circulating normally. The arrows without feathers show the direction the water takes when the tap is opened. It is peculiar to note (it can be instantly observed in a glass apparatus) that when the tap is closed the water is travelling downwards along the secondary return; the instant the tap is opened the direction is reversed (see arrows), and immediately the tap is closed again it resumes its downward course

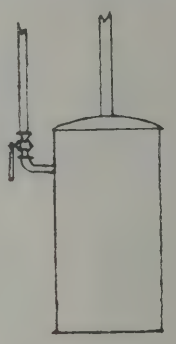

FIG. 28.

without a moment's hesitation, and as tranquilly as if it had not been disturbed.

If a secondary flow and return service extends around a large residence, and is not covered with felt or some such material, it loses a deal of heat, which is prejudicial to success at any time. Even if the power of the apparatus can afford the loss, the principle is wrong, for why should the fire be applied to heating the water if a moderate or fair proportion of the heat is afterwards diffused and lost in useless places? This, however is not the only drawback, as the fact of the cylinder being in a warm kitchen can be utilised to advantage by making it retain its heat all night, and yield water before the fire is lighted in the morning, if we stop this lavish and useless distribution of heat from the pipes during the night.

The introduction of a stop-cock in the secondary return will effect this, as by closing the cock at night the circulation is at once stopped, and the warm water that is in the cylinder remains there. If the cylinder be felted and encased, the length of time the water will remain hot after the fire is extinguished may be considered astonishing. By this arrangement hot water could be had until long past midnight, and warm water in the early morning. This is supposing that hot water be left in the cylinder overnight. There is no objection whatever to this stop-cock, as it is not a dangerous element in the slightest degree. It is closed at night and opened in the morning, but should the opening of the tap in the morning be forgotten, then the only trouble is that a deal of cold water would have to be drawn from the taps before hot was obtained, as the closing of the cock would convert this service into a single pipe rising main; that is to say, the utility of the return would be lost while the stop-cock remained closed; but the first person who went to a draw-off tap would discover the omission.

The best place for this stop-cock is down close to the cylinder, and should be easily within reach; if possible, as Fig. 29. It is not so likely to be overlooked as it would be in an inconvenient position. If it cannot be got at the point shown by reason of this piece of pipe being out of sight, then it can be placed in a horizontal portion of the return with a cross key and chains attached as Fig. 30. If the kitchen range (in which the boiler is fixed) is of that kind which has the fire closed as usual for all general purposes, but which permits of the fire being opened when the

FIG. 29.

work of the day has ceased, it is a great advantage, as it enables one to have the water kept hot all night, ready for early morning, with greater facility than ever. The opened fire does not burn fiercely like it does when closed, but resembles the fire in an ordinary open grate, which, if judiciously fed with fuel, will sometimes have red cinders in it six hours after it was last attended to. If, therefore, a fire of this description is opened, and fed with some small coal the last thing at night, there should not be the least doubt about having a warm bath before the kitchen fire is lighted in the morning. This, supposing the apparatus is carried out as explained, or is well covered with felt everywhere.

The size of pipes used in the cylinder system vary somewhat from those in the tank system. In this latter the main flow and return between boiler and tank are rarely larger than 1¼in., commonly 1in. If a larger than 1¼in. pipe were used it would add materially to the aggregate contents of the apparatus, so that a boiler capable of working a 50-gallon tank with such pipe ought not, perhaps, to have more than a 35-gallon tank with 1¼in. pipe if the system extended far. This increased capacity of the pipe could be easily allowed for; but there is another serious objection with large pipe in the cylinder that it radiates and loses more heat than a small size, unless it be well covered with felt, which the last, and probably the most material objection to the larger pipe is the increased cost both in material and labour of fixing, which is not proportionate.

With exception of these objections, every thing is in favour of having large pipes (I am alluding to the tank system), the circulation taking place more freely and rapidly, and, with

s most important, they do not so quickly get topped with "fur." A 1¼in. pipe has a fourth more interior surface than a 1in., so that a given thickness of incrusted deposit would be a fourth onger time in developing itself; then, when we ave a ¼in. deposit in a 1¼in. pipe, the bore is ly reduced to ¾in.—quite sufficient to let the pparatus work steadily—whereas with a 1in. ipe the bore would be reduced to ½in., when it ecomes time for its renewal. In soft-water istricts a small-sized pipe, say 1in. and ¾in., can be uch more frequently used, as they do not ecome stopped; but with hard water a large ipe should be given preference always.

The large pipe is ultimately economical, as the enewal of pipes is so serious and expensive a natter. It necessitates the dismantling of the ange (which stops cooking operations, of ourse), and the entire renewal of the affected arts, as to attempt to clear the choked pipes ould be more expensive still. It is quite ossible to clear a pipe if specially desirable. It

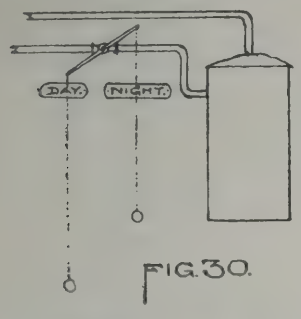

FIG. 30.

ould be well heated, when the superior pansion of the metal causes the pipe to dis-gage itself from the deposit, and a subsequent mmering will cause it to crumble out. As the reatest deposit is always in the pipes nearest the oiler, and more so in the flow than in the turn, a common and very good practice in e tank system is to have large pipes, say 1¼in., r 20ft. from the boiler in the floor, and a few et in the return. The remainder of these pipes ust be 1in. This refers to ordinary domestic ndertakings of a moderate character. In large ndertakings, hotels, instituttons, and often-mes country mansions, larger pipes are needed; t a floor and return service of the tank system holly carried out in a larger pipe than 1½in. is decided rarity (except for heating purposes). 1¼in. pipe will be sufficient for all except very rge works.

The next paper will deal with the size of pipes ost suited for the cylinder system, and will give st sized cylinders (or tanks) for certain orks.

NEW MUNICIPAL BUILDINGS FOR BATH.

THE Corporation of Bath received on Tuesday a report from Mr. William Young, R.I.B.A., of Lancaster-place, Strand, as to e best mode for securing additional accommo-tion for municipal purposes. He suggested two ternative schemes. Under No. 1 he would lace the whole of the building required for creased municipal accommodation, and the new olice-court and rooms in connection therewith, the south side of the Guildhall. This would ke a portion of the market and the whole of e houses in Orange-grove up to the police-ation. By this plan the new court and the resent one, with all the rooms, would be in mmediate connection with the present court, nd the council-chamber and municipal offices ould also be in immediate connection with the resent council-chamber and staircase. On the orth side of the Guildhall the Art Galleries and cience and Art Schools would be placed. This te would take the ground occupied by the White Lion Hotel and the municipal offices djoining. The façade of the Art Gallery, &c., ould be so designed as to form one important ile of buildings, extending from Bridge-street Orange-grove, with the Guildhall as a centre. nder Scheme No. 2, the market and other pro-erty on the south side of the Guildhall is not terfered with. The new court and municipal ccommodation is placed on the site of the White ion Hotel. By this plan it will not be possible get a communication between the new court nd the present one on the ground floor, although on the first floor communication can be got between the new council-chamber and other apartments on the first floor and the present chambers. He would put the Art Gallery and Science and Art Schools at the corner of Bridge-street and Newmarket-row, and, to make the scheme complete, would get a frontage to Bridge-street extending from High-street to Newmarket-row. The centre portion of the building could be used to form a grand arcade-entrance leading to the centre of the market, with, perhaps, shops on each side of the arcade. In both schemes Mr. Young suggests removing the inner row of piers surrounding the octagonal centre of the market, putting a new domed iron roof extending to the outer wall of the octagonal centre. Under scheme No. 1, the cost of a building two stories high—*i.e.*, ground and first floors, including a basement under the whole building, the floors to range with present building, would be about £19,000. If with another floor added—*i.e.*, basement, ground, first and second floors, the cost would be £23,000. The cost of a building under scheme No. 2, including basement, ground, and first floors, would be £17,000. If with basement, ground, first, and second floors, £21,000. The city corporation, on the recommendation of the joint committee, decided to adopt scheme No. 1, and to institute an open competition for designs, with Mr. Young as assessor. The question of the premiums to be offered was left to the committee to arrange.

THE LONDON CARPENTERS' STRIKE.

THE dispute in the Metropolitan building trade, now in its fifteenth week, appears no nearer settlement than before. As had been generally expected, the terms offered by the masters last week were unanimously rejected by the men at a meeting held at the Old Friends' Hall, St. Martin's-lane, on Thursday night in last week, although a resolution was passed stating that they were willing to submit their demands to a board of arbitration, to be chosen by mutual agreement. At an adjourned meeting, held on Friday night, it was decided to strike thirty more firms on Saturday. This was done, and three of those firms have already conceded the 10d. an hour and 47-hours week, making a total of forty firms that have now yielded the point. Funds are coming in freely to the United Trades Committee. £700 has been received from the Amalgamated Society of Engineers as the first results of a levy of 3d. per member, while levies varying from 3d. to 3s. have been made by branches of the Amalgamated Society of Carpenters and Joiners throughout the country.

A COLLEGE OF MASONS.

IN order to promote the study of the science of masonry among their fellow-workmen, the masons who have received certificates from the City and Guilds of London Institute have founded a College of Certificated Masons, to which only fully-qualified practical masons who have obtained certificates from the City and Guilds of London Institute will be admitted. To carry out its object, the college will send every year a circular with a list of its members to all employers and architects of the United Kingdom, pointing out the advantages to be obtained by following the classes of scientific masonry at the City and Guilds of London Institute. Workmen gain thereby greater ability and rapidity, and obtain facilities for rising in their calling. Several of the pupils have obtained first-rate appointments through attending these classes. The studies comprise two courses of thirty lessons each. In the lower course the geometrical knowledge required for setting out work is taught with practical applications. In the upper course the models of various interesting structures are set out and constructed, the subjects to be varied every year. Only pupils who have followed the lower course will be admitted to the upper course.

For each course certificates are delivered to the pupils who are considered both in practical and theoretical knowledge to offer sufficient guarantees of capacity to employers.

The fees for each course are one guinea. In case some workmen be not able to pay this sum all at once, the College of Certificated Masons will advance the money and be paid back in instalments.

The members of the college will act as assistant teachers in the classes, and advise the Guilds Institute as to the practical ability of the candidates for certificates.

A registry of members seeking employment will be kept at the college.

Forms for employers to certify to work done in their employment will be provided to members of the college and to the pupils of the classes. These certificates will be kept by the college; copies will be forwarded to persons requiring references about members.

All drawings made in the class will be stamped and certified by the college.

Until the number of the members of the college be sufficient to elect a president and council, all business will be transacted by the Master of the Classes.

Employers wishing to engage members as clerks of works, foremen, journeymen, or in any other capacity, should write to the Master of the Classes of Scientific Masonry, City and Guilds of London Institute, Exhibition-road, S.W.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

WILTS ARCHÆOLOGICAL SOCIETY.—The three days' meeting of this society was brought to a conclusion on Friday, when the members drove from Wilton and visited the churches of Coombe Bassett, Stratford Tovey, Bishopstone, and Broadchalk, returning at three o'clock. The proceedings terminated with a visit to Wilton House and grounds, where the Earl of Pembroke conducted the party over the building. Mr. C. E. Ponting, F.S.A., described the architectural features of the mansion and its characteristics, including the styles adopted by Inigo Jones and Wyatt. Lord Pembroke gave an interesting description of the interior, the paintings, and works of art.

CHIPS.

A new Roman Catholic church is about to be built opposite the ruins of the ancient town walls at Tenby, Pem. The style will be Late Decorated, and the building will consist of nave, chancel, and sacristy, with organ-chamber over, and with provision on the north side for an aisle, Lady-chapel, and porch. The church will be built of local stone, and in the east end, facing the main street of the town, will be a richly-traceried window, surrounded by statues of local saints. Mr. F. A. Walters, F.S.A., of Great Queen-street, Westminster, is the architect.

By the death of Professor Albert Kretschmer, of Berlin, Germany has lost, at the age of 66 years, one of her chief painters, who had devoted much time to the study of national costume and to theatrical mountings. In 1864 he published "The Costumes of all Nations," and in 1870 "The German National Costumes." In 1889 he retired on a pension, and has since become the founder of the "Museum of German National Costumes."

At the Wesleyan Conference in Nottingham, on Tuesday, it was reported that during the year there had been sanctioned the erection of 108 new chapels, 18 ministers' houses, 15 schoolrooms, and 133 alterations and enlargements. The total cost was estimated at £276,806; the total additional accommodation would be for 18,115 sittings. The amount actually expended on new erections and reduction of debt during the year had been £353,212.

A stained-glass window has just been put into the Abbey Church of Romsey by Messrs. Powell and Sons, of Whitefriars, London, to the order of the Hon. and Right Hon. E. Ashley. The subject of the representation is that of the sick and impotent folk at the pool of Bethesda, waiting for the angel to trouble the water. At the foot are the words: "In most loving memory of Sybella Ashley, her husband and children have placed this window."

A national subscription was opened some time ago for the erection of an equestrian statue to the late Emperor Frederick, on the scene of his victory at Wörth, and has already reached such an amount that a competition will shortly be opened designs for the monament.

At the next winter exhibition of the Royal Society of British Artists, the members intend to try the experiment of framing and hanging water-colour drawings with white mounts. It remains to be seen whether this return to the sober mounts of the days of Cox, De Wint, and Barrett will induce water-colour artists to adopt a lower and more suitable pitch of colour than has been the fashion during recent years.

BARTON-ON-IRWELL UNION.—POST OFFICE, BRENTWOOD.—SHROPSHIRE STUDIES.—NEW PREMISES, DUKE-STREET, W.—OVERMANTEL IN STOKESAY CASTLE, SALOP.—STOKESAY CASTLE, SHROPSHIRE.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES IN SHROPSHIRE.—THE SELECTED DESIGN FOR THE SOUTH KENSINGTON MUSEUM BUILDINGS.

Our Illustrations.

NEW WORKHOUSE BUILDINGS AT PATRICROFT, NEAR MANCHESTER, FOR THE GUARDIANS OF THE BARTON UNION.

The guardians of this union, in a selected competition of local architects, sent up three designs to the Local Government Board for the opinion of their architects, and the design of Messrs. Mangnall and Littlewoods was selected—a view of which we give in the Building News this week. The workhouse was originally intended to accommodate 600 inmates; but in consequence of the limited area of the site (which is about six acres in extent), and in accordance with suggestions of the Local Government Board, this has been reduced to 500 inmates. The buildings will be substantially erected with selected common bricks, with pressed bricks for quoins to doors and windows, and moulded brickwork with stone sparingly introduced. The eaves will overhang the walls, which gives protection to the work. The residential wards will in most cases have concrete and boarded floors, and the hospital buildings will be of the most modern type so far as regards sanitary construction, ventilation, and prevention from fire. The cost is expected to be about £24,000.

BRENTWOOD NEW POST-OFFICE.

This building, which has been recently finished, is a prominent feature in the High-street. The design is in Renaissance, of the 17th century, built of red brick, with Bath and Portland stone dressings, and slated with Bangor permanent green slates. The public office, which is 21ft. by 19ft., is lighted by two 5-light elliptical-headed windows; it is floored with pitch-pine blocks, and the fittings, of pitch pine and mahogany, are of pleasing design and finish. There is a corridor from the public office to sorting office, situated at the rear of the block, right and left of which are offices, instrument room, &c. In the basement is the linesmen's room, storage rooms, and cellars. On the right of the public office is the postmaster's private residence. The building was designed and superintended by Mr. A. T. G. Woods, M.S.A., architect, Brentwood, and the work most satisfactorily carried out by Messrs. Rogers and Robson, builders, Brentwood, at a cost of £2,000.

NEW PREMISES, DUKE-STREET, GROSVENOR-SQUARE.

These premises, now being erected for Messrs. Rose Bros., ladies and gentlemen's tailors, will form the central feature of a block of buildings on the east side of Duke-street, Grosvenor-square, which were illustrated in our issue of Feb. 13th last. The upper parts are entirely devoted to fitting rooms, workshops, and caretaker's rooms. The materials employed are red brick (six courses to the foot) and Ketton stone, with tiled roof. Messrs. Kirk and Randall, of Woolwich, are the contractors, and Mr. W. D. Caröe, M.A., F.R.I.B.A., the architect.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

These illustrations are described in our preliminary notice of the places to be seen during this excursion next week, on p. 175.

THE SELECTED DESIGN FOR SOUTH KENSINGTON MUSEUM BUILDINGS.

Last week we announced the result in this important competition, when we briefly referred to the chosen design by Mr. Aston Webb. We now print the two principal plans, with the exterior view of his buildings. On pp. 171-72 will be found a critical description of all the designs, illustrations of which will shortly appear in our pages. Next week we shall publish further drawings of the selected design. Mr. Alfred Waterhouse, R.A., was, it will be remembered, the professional referee. These plans have been on view at the House of Commons this week, and will shortly be exhibited at South Kensington to the public.

CHIPS.

Messrs. R. Waygood and Co. took their staff to Richmond in a river steamer on Bank Holiday and dined them at the Castle Hotel. Over 400 passengers were on board. Only teetotal refreshments were provided, but the day was a merry one. The firm paid all expenses, thus adding another to the creditable instances in which employers are discountenancing the not very reputable plan of allowing their workmen to solicit customers for beanfeast subscriptions.

The partnership hitherto subsisting between Messrs. Hemsoll and Smith, of Sheffield, architects and surveyors, has been dissolved.

Sir Noel Paton, R.S.A., has declined to be put in nomination for the presidentship of the Royal Scottish Academy.

At a consistory court held at Chester Cathedral on Thursday in last week, a faculty was granted for taking down the whole of the present church at Wybunbury, with the exception of the tower, and rebuilding it to larger scale. The estimated outlay is £6,000, of which nearly £5,000 has been promised.

The local board of Ystradyfodwg have adopted plans by the engineer and surveyor, Mr. J. W. Jones, for the construction of two main sewers in the Rhondda Fawr and Rhondda Fach valleys. The first-named sewer will be nearly 11½ miles in length, and will chiefly consist of brickwork ranging up to 3ft. 3in. by 2ft. 2in. The Rhondda Fach system is a much less formidable undertaking, consisting of about 6¾ miles of 12in. and 15in. stoneware and iron pipes, chiefly laid in open cuttings.

Memorial stones of a new Wesleyan chapel will be laid in Huddersfield-road, Halifax, on Saturday. The building will include chapel with gallery seated for 700 people, and large schoolroom underneath. The cost is £5,300, and the chapel replaces one built in 1808.

The Kitchen Committee of the House of Commons in their report recommend that the kitchens should be removed to the top of the building, and be placed over the committee-rooms, so as to prevent the smell of cooking pervading the lower rooms. A similar proposal was mooted two or three years ago, but was not carried out.

Mr. Walter Mitchell, C.E., who superintended the erection of the Folkestone Art Treasures Exhibition five years ago, has been appointed clerk of the works by the War Office upon the erection of the new cavalry and artillery barracks, officers' mess and quarters, riding schools, stables, and other important buildings about to be built at Shornecliffe Camp under the Resident Commanding Royal Engineers. These and other building to follow will cost nearly £300,000, and will occupy from three to four years in construction.

Mr. Wignall, chief engineering assistant to Mr. T. de Courcy Meade, M.Inst.C.E., has been appointed assistant city engineer to the Municipality of Cape Town.

The foundation-stone of a new church for Harden, near Bingley, was laid on Saturday last. Messrs. Healey Brothers, of Bradford, are the architects. The church will be in the Early English style, with nave, chancel, and north aisle. The cost is estimated at £2,050, and the church will seat about 250. The internal fittings will be of pitch-pine, with open benches.

THE CONGRESS ON HYGIENE.

The seventh International Congress of Hygiene and Demography will be held in London during next week. The proceedings will be inaugurated on Monday afternoon by a general meeting to be held in St. James's Hall, Piccadilly, at 3 p.m., when the Prince of Wales, as President, will take the chair. The meetings of the sections will be held on Tuesday, Wednesday, Thursday, and Friday next, from 10 a.m. to 2 p.m., in the room of the Royal and other learned Societies at Burlington House, Piccadilly, at the University of London, Burlington Gardens, and at the Royal School of Mines in Jermyn-street. Saturday, the 15th inst., will be devoted to excursions, and on Monday, August 17th, at 11 a.m., the closing meeting of the Congress will be held in the theatre of the University of London.

Sir Arthur W. Blomfield, A.R.A., the president of Section 3, "Architecture in Relation to Hygiene," will deliver his inaugural address on Tuesday next, after which the following papers will be read:—"Open Spaces," by the Earl of Meath; "Hygienic Principles for the Extension and Internal Improvement of Towns," by J. Stübben, City Architect of Cologne; "The Hygiene of Groups of Dwellings at low rentals," by Charles Lucas, of Paris; "The Control of the Construction of Buildings," by Thomas Blashill, F.R.I.B.A., Superintending Architect to the London County Council; and "The Heating of Towns by Steam from Central Stations," by S. M. Burroughs.

On Wednesday, the papers will include "The Hygienic Composition of Walls of Dwelling Houses," by Prof. Emile Trélat, of Paris; "Pile Foundations in Marshy Land, and the exclusion of Damp from Dwellings," by P. J. H. Cuypers, architect, Amsterdam; "The Sanitation of Theatres," by Lennox Browne, F.R.C.S.Ed. an exhibition of diagrams illustrative of the Sanitation of Theatres, by Ernest Turner F.R.I.B.A., architect to the Royal Academy of Music; "Some Insanitary Superstitions in House Building," by H. H. Statham, F.R.I.B.A.; and "Four-inch Drains v. Six-inch Drains," by G. M. Lawford, A.M.I.C.E.

The papers for Thursday, are—"The Cause of the Unhealthiness of Workmen's Houses in Paris, and the Practical Remedies," by Emile Cacheux, Paris; "Common Lodging Houses," by P. Gordon Smith, F.R.I.B.A., architect to the Local Government Board; "Cottage Dwellings for the Industrial Classes," by Rowland Plumbe, F.R.I.B.A.; "Block Dwellings for the Industrial Classes," by John F. J. Sykes Medical Officer of Health, St. Pancras; and "Dr. Koch's New Institute," by J. Böttger Berlin.

On Friday papers are to be read on "English Isolation Hospitals," by R. Thorne Thorne, of the Local Government Board; "The Heathcot Hospital, Leamington," by Keith D. Young F.R.I.B.A.; "Temporary Local Isolation Hospitals as opposed to a Central Hospital," by the Rev. C. E. Few, Vicar of Seal, Sevenoaks; "Hospital Tents and Huts," by Dr. Duchausoy and "Asylum Arrangements and Construction, by Richard Greene, M.D., and G. T. Hine F.R.I.B.A. An exhibition of drawings of sanitary construction will be on view during the congress in the Library of the University of London.

The statue of the late Earl Sydney commenced by Sir Edgar Boehm for St. Nicholas Church Chislehurst, is now being erected over the family vault in the church. Sir Edgar Boehm was at work on this statue when he died early in this year, and it has been finished by Mr. Gilbert, R.A. The statue is being placed in the Scadbury Chantry.

A new police-station has been erected at Bar Dock, near Cardiff, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air, while fresh air is admitted through their improved air inlets.

At the last meeting of the City Corporation it was reported that a plot of land on the Embankment had been let on a building lease to the Thames Conservancy Board at a rent of £500, which was at the rate of £10,000 per acre. On a report of the Bridge House Estates Committee it was resolved to lay out the Bridge House Farm at Lewisham, fifty-two acres in extent, for building purposes, and to construct, at an expense of £11,500, the roads and sewers.

WAYSIDE NOTES.

WHEN the South Kensington Museum has got its decent elevations, it will surely be time for the fathers at the Oratory hard by to bestir themselves in the matter of a permanent and respectable front to their building, which makes at present a disgraceful show. I did hear a short time ago that the architect to the building was busy with the designs for the completion of this front. That this may be true we must all hope. The plan of leaving the most visible portion of a church in an unsightly condition, so that persons may be induced to give subscriptions to have the eyesore removed—a mode of procedure that one can imagine would have stirred up to indignation all the anti-Jesuit feelings of Charles Kingsley—is surely played out by this time.

There is to be an international congress on accidents to workmen, at Berne, from the 21st to 26th of September. Delegates from Belgium, Germany, France, Great Britain, Holland, Italy, Austria, Hungary, Russia, Sweden, Norway, Switzerland, and the United States have been already promised. The congress should, therefore, be successful, if a large number of foreign delegates can help forward the question. Upon this there should be much to say. We see plainly enough that workmen continue to suffer from disastrous accidents in many businesses and occupations, and we know that there are many cases where their sufferings get no compensation. If the Berne congress can remedy these evils, its members will earn the thanks of the labouring millions of every nationality.

I read that Prince Bismarck is engaged in producing, in his brick-kilns at Friedrichsruh, a new kind of brick and tile. The Prince is very active in business when at home. Not long ago his saw-mills were burned down; but he has now erected new ones, which are now occupied in executing some extensive orders for wood pavement. Altogether, from his mills and other industries, Prince Bismarck is reported to receive upwards of £10,000 per annum. We must look out for his new tile and brick. Hard, vitrified, adamantine, clinker bricks and tiles should be in the way of an "iron chancellor"; but we must wait till the articles are placed on the market before we can satisfy our curiosity as to their exact description and manufacture.

The Hanover Chapel Bill has received the Royal Assent, an amendment on the third reading in the House of Commons, that the Bill be read "a third time that day three months," having been lost by 85 votes to 55. The building will therefore almost certainly be rased to the ground, and "desirable" shops and other premises will presumably spring up on its site.

There has been little reference in Parliament to the Report of the Royal Commission on Westminster Abbey. On Friday last Mr. Shaw Lefevre asked the First Commissioner of Works whether he would lay before the House the designs which Mr. Pearson prepared for the Royal Commission for the monumental chapel on the site of the houses in Old Palace-yard, and also the evidence which Mr. Pearson gave in support of them, so that a full comparison might be made between this scheme and that for a chapel on the refectory site. While not in favour of the scheme that Mr. Shaw Lefevre would adopt, I think it would have been as well if Mr. Plunket could have placed all the drawings and evidence relating to the proposed Campo Santo before the Members of the House of Commons, so that a general ventilation of the whole matter might have been obtained. This, it seems to me, is just what is required, seeing that the Royal Commission brought the inquiry to so unsatisfactory an end. Had they properly agreed as to one of the schemes, there would have been nothing more to do than go ahead with the plans and get the building erected. As it is, the result of the commission was a fiasco, or something of a very near resemblance. And now we should like to hear freely-expressed general opinions about the questions on which the members of the Royal Commission disagreed. It appears, from Mr. Plunket's reply to Mr. Shaw Lefevre, that Mr. Pearson does not wish to publish the sketch plans prepared for the proposed buildings at Westminster, there having been an understanding at the outset that the designs should be treated as confidential. The First Commissioner of Works stated that he had no objection to Mr. Pearson's publishing his designs in any way he thought fit. If, then, the publication of the plans would do anything to help forward the now vexed question, it is much to be hoped that Mr. Pearson will consent to their being published at an early date. As the matter stands, everything seems in a most unsatisfactory condition. The public must be bewildered, what with the failure of the Royal Commission and the continual pressing forward in daily papers of "rival" schemes for memorial chapels, from the crypt to the cock-loft of the Abbey. Possibly the only persons at all convinced as to the best course to adopt are architects, who must have a very clear notion that the Refectory site is, on the whole, the most desirable.

Architects, however, have just now perhaps more of a notion of holiday-making than the consideration of reports of Royal Commissions and the other dry-as-dust topics that suffice for the ordinary days of the year. I suppose it is now about "head assistants'" time for getting away, leaving the latter end of the month to principals, the office-boys having long since had their weeks at Margate mixing sand-pies instead of Indian ink, and the pupils—the least independent of this variable and precocious genus at any rate—having followed them at no distant date. May they one and all have derived every possible enjoyment from their outings. In theory any one of architectural tendencies does enjoy his holidays; he also is supposed to do some little sketching and measuring. I have no doubt that there is every foundation of truth in the first. Of the latter I am inclined to be somewhat dubious, and even to venture to hint that many would do better to leave figures, dimensions, and diagrams behind them when they go holiday making, excepting such as, like Sir Gilbert Scott in his "Recollections," they may trace on the yellow sands. There is some gain in letting the mind lie fallow for a season; it is all the more productive when the time comes to resume daily duties.

I recently obtained my own permission to have a day out in the Kentish Weald, and saw one or two old places worth mentioning. Brenchley, south-east of Tunbridge, seems an architectural dead-letter, considering the extraordinary wealth of old architecture—*real* architecture, such as the Weald possesses above other home counties—in this village. It may in later years become better known, as I notice that the new railway to Cranbrook and Goudhurst, now in course of construction, passes near the place. There is a wonderful façade of old Kentish half-timber work, restored, but by no means destroyed. There are also other old buildings of interest and beauty; indeed, there is only one new house in the whole village street. The church is fine, too, the buttresses of the square tower being exceptionally noteworthy for their vast size. I should imagine that the architect was a little bit nervous, fearing continually that the tower was not strong enough, and adding about 6in. in width to the buttresses every day that he set to work on the plans. Worth going to see is the beautiful, homely old house at the corner of the churchyard. It is a forcible example of how little elaboration has to do with architectural and homely effect in domestic work. Staplehurst and Headcorn all will think they know; but perhaps on reflection many will remember that whereas they have, like myself, passed the places on the main line of the S.E.R. scores of times, they have never been in these old Wealden villages and seen their beautiful old houses and churches. Staplehurst church stands well out of the plain when approaching from a distance. It has a glorious old oaken door, with iron hinges hammered into fishes and all sorts of devices. The whole arcade—there is only *one*, as in many Kentish churches—at Staplehurst leans very much on one side. Headcorn Church is grand, if solitary and slightly woebegone in appearance, and is quaintly set down among the old cottages of this pleasing village. GOTH.

On Monday the Earl of Coventry opened a new Cottage Hospital at Bromsgrove. It replaces one built on another site fourteen years ago, and its cost, with furniture, has been about £4,200. The hospital, which has been built upon the pavilion system, has been erected from the designs of Messrs. Cotton and Bidlake, architects, Birmingham, by Messrs. Brazier and Son, contractors, Bromsgrove.

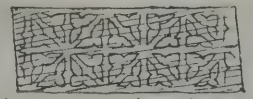
RAILROAD ARCHES.

SEVERAL necessary conditions to be observed in the construction of arches in railway embankments are stated in a paper on the subject by Charles G. Churchill, a member of the Engineers' Club, Philadelphia. Amongst these the author says that large factors of safety may be added to buried arches by simply placing the bank material over the structures in horizontal layers and packing the same. Such layers of earth may be likened to layers of brickwork, which materially support the weight over an opening in a wall. A wedge-like form represents the acting mass of earth or brickwork over the opening, and the weight of this wedge represents the pressure which a supporting beam would have to sustain at the opening. The materials used for the arch should be of uniform hardness. Thus, if brick is the arch sheeting, the cement should be of the same strength as the brick; if the arch is of rubble masonry, the strength of the cement will determine the strength per square foot of the arch sheeting. For a first-class cut stone arch there should be small joints of about ¼in., filled with the best Portland cement mortar; but carefully cut arch stones with joints of over ¼in. are useless, as the strength of cement in this case alone determines the strength of the arch sheeting, and this is generally less than the strength of the stone. Other recommendations are to cover the whole top and crown of arch, especially brick and rubble arches, with a coating of strong cement mortar, so as to turn the water off or to carry it to proper channels, thus to prevent leakage through the arch, and to make the arch assume a parabolic curve, though practically it is made up of circular curves. The author gives sections of the most economical forms of buried arches of 12ft., 16ft., 20ft., and 30ft. spans of brickwork. The parabolic line, being parallel to the line of pressure of the arch, is much more economical and stronger than a full centre arch; in short, to make the latter equally safe it must have a thick sheeting, and be heavier at the springing. Thus, for a 20ft. arch of the parabolic section, 24in. sheeting or thickness is shown, and a thickness of 5ft. 6in. at springing. These facts are of importance to builders of railway arches under high enbankments.

STEEL CEILINGS.

THE application of iron and steel to decorative features in America is largely on the increase. We have not only house fronts and cornices of stamped metal, but enrichments for mouldings and friezes. A scientific contemporary, published in New York, illustrates an improved steel ceiling, showing the use of the Kinnear steel for that purpose, made by Kinnear and Gager, of Columbus, for a Masonic Lodge room at Circleville. The room is 70ft. by 43ft., and the height 24ft. It was built many years ago, and had a plaster ceiling. As this was often falling in pieces, it was decided to put up a Kinnear ceiling. These ceilings are now general, and are decorated. The design of the lodge-room ceiling is broadly treated. There is a bold, panelled border, and the ceiling is divided into panels well broken by corner, ornamental, diamond-shaped squares, with a similar large diamond panel in the centre. The steel ceiling is in favour with the insurance underwriters, who allow a credit of 15 to 20 cents on the rate of insurance effected. This application of steel is at least not so objectionable as many others.

Mr. Henry Hart has formally resigned his appointment as district surveyor of West Kensington. He was originally appointed in 1865.



The city of Boston, Mass., has recently established an ordinance regulating the laying out of new streets. Henceforth all new streets are to be laid out in accordance with a plan to be established by a Board of Survey, which also fixes all street lines and grades. By this means comprehensive plans may be carried out, if not all at once, yet with a definite end in view.

The sales noted in the sale book at the Royal Academy have amounted to 234 pictures, sold for £18,400. Of course, this does not represent the total sales of pictures in the Exhibition, but merely those where the seller and purchaser have been brought together through its medium. Of these 234, three exceeded £1,000 in price, thirty-two exceeded £100, twenty-five ranged between £50 and £100, and a hundred and seventy were sold for £50 and under.

SKETCHED BY ED HODKINSON

NOTES ON STRIKING HIGH-CLASS MOULDINGS.

By M. Powis Bale., M.Inst.M.E., &c.

Author of "Woodworking Machinery," "Saw Mills," "A Handbook for Steam Users," &c.

I THINK it will be generally admitted that the production of really high-class mouldings —that require little or no hand-finishing—is the exception and not the rule. This arises from a variety of circumstances, such as (1) bad wood, (2) poorly-constructed machines, (3) bad adjustment of cutters, (4) improper speed, (5) insufficient foundations, &c.

(1) It goes without saying that high-class moulding cannot be produced without good material; we need only remark, therefore, that the wood should be thoroughly sound, and well seasoned.

(2) The construction of the machine is also a very important factor, and it may not be out of place to extend our remarks thereon to some length. The two classes of machines generally used—not including vertical spindle or shaping machines—are: (1) centre-feed machines, (2) overhanging-spindle machines. For light purposes overhanging-spindle machines are extremely handy and useful, but for large and high-class work centre-feed machines are to be preferred, and our remarks on construction will therefore refer chiefly to this class.

CONSTRUCTION OF CENTRE-FEED MOULDING AND PLANING MACHINE.

After a lengthened experience, it has been found that the box or solid framing is the best form to adopt for the main frame of the machine. The reason for this is not far to seek, as in moulding and planing wood very high speeds are necessary, and various strains are set up, and to absorb these and their consequent vibrations, a considerable weight of metal is necessary, and this metal is much more effective when in the form of a single casting than when put together in sections. Box-framing is slightly higher in first cost, but this is more than counterbalanced by its increased strength and resistance to stress, by economy of material in ratio to strength, and by its greater neatness of design. The cutter spindles should be supported by bearings of ample area, and these should, as far as possible, be made adjustable for wear and end play, more especially the bearings, which are subject to considerable belt tension. The question of lubrication must be carefully attended to, and the bearings guarded from dust.

To secure a constant and even feed, and prevent the slipping of the wood, it is important that all the feed gearing be expansively geared up together. If the feed rollers are geared separately, the wood is apt to slip, particularly if difficult to work. In the best class of machines, the intermediate pinions are made of steel, or gunmetal. As a sufficiently long belt may be obtained, and as, at the same time, it economises space, it has been found convenient to place the countershaft working the feed gear within the framing of the machine. This should be fitted with four-speeded cones, so as to give varying speeds of feed of, say, from 10ft. to 60ft. per minute. The countershaft working the cutter spindle should be placed, say, 15ft. away at least, as running belts at short centres is to be condemned from every point of view. The cutter-block and spindle should be made of steel, as they are thus stiffer in work and can be made of somewhat smaller section than with wrought iron. The cutters should be fastened to the blocks by dovetail-headed bolts, sliding in suitable grooves These should be made of best Swedish iron, and be very carefully fitted. Irons should never be fastened by means of studs tapped into the blocks, as the method is both dangerous and uncertain.

A very considerable difference of opinion seems to exist amongst makers as to the best position in the machine in which to place the vertical spindles or side cutters; some fit them at the end of the machine, to act on the wood after it has passed the top and bottom cutters; others put them in the centre of the machine, between these cutters. The writer is in favour of the latter plan, as the wood is then directly under the action of the holding-down apparatus, and there is less liability to its jarring when under the operation of the cutters. The plan of placing the vertical spindles at the end of the machine renders them rather more accessible for adjustment; but, in all cases, holding-down or pressure apparatus should be fitted close up to all the blocks.

It is of the utmost importance that the cutters should bed evenly and well on the block, and, to secure this, knives are sometimes made very slightly concave from the cutting to the back edge, so that when the nuts are tightened they spring slightly, and bear on the whole surface of the block alike. Cutters made slightly thicker at the back than at the cutting edge are preferred, as they are less likely to slip forward from the high speed and centrifugal force set up. It is important that the iron round the slot holes be true, and that all the hollows and smithing marks be ground out, so that the nuts and washers have a perfectly true bed to rest on.

But, given all this, and a good and true block, we sometimes find irons flying, and shifting on their seats. This may arise from the bolts not being tightened enough, or from being tightened too much, this latter being a very fruitful cause. In order to secure the bolts, as he thinks properly, an inexperienced or careless workman is apt to use a powerful wrench, with sometimes a pipe on the end of it, to tighten them up—the thread of the bolt consequently becomes damaged, the pitch being stretched and bulged, and made coarser. One of the reasons why there is sometimes a difficulty in bedding the nuts, is that the threads are often allowed to get dry and filled with grit. Irons may be prevented from slipping by bedding them on several thicknesses of brown paper or thin leather.

In machines where movable blocks are employed, it is of the utmost importance that the spindle holes are perfectly true and fit the spindle tight, and are exactly parallel with the cutter face: this is not altogether an easy matter with long blocks, as they are apt to get slightly oval. When the cutter-block is revolving at a high speed, this will allow it to spring sufficiently to damage the output, and is one of the causes of inefficient working very difficult to detect. Light blocks require balancing as much as heavy. If movable blocks are used, they should in all cases be planed by the makers after being fixed on their spindles.

MAKING AND TEMPERING MOULDING IRONS.

It need hardly be said the steel used for cutters should be of the very highest possible quality, combining in its nature, as far as may be, toughness with hardness. It must be admitted that there is a considerable amount of art in forging and tempering cutters successfully, as owing to the varying amount of carbon contained in different samples of steel, the amount of tempering varies accordingly, and the exact temper necessary can only be ascertained by one or more trials; the folly, therefore, of treating all kinds of steel alike, which is sometimes done by the workman, is at once apparent. It may be taken as a rule that if it is necessary to heat the steel so hot that when it is annealed it appears coarser in the grain than the piece from which it was cut, it may safely be concluded that it is of too low a temper for the required work, and a steel of a higher temper should be selected. A steel cutter, when properly tempered and suited to the work in hand, should always be of a finer grain than the piece from which it was cut.

Moulding irons may be roughed out and ground down to something near the size by means of small profile grindstones or emery wheels, and when filed to the exact profile and tempered before using, a cutting edge should be put on them by means of a slip of Turkey or other good oil-stone. When the irons are of simple form, to avoid softening and rehardening, the steel may be ground to the shape by the series of small grindstones spoken of, the peripheries of which are turned up to suit the rounds and hollows of the mouldings. The author has found Bilston grindstones answer very well.

With the object of preventing the constant change of profile when sharpening moulding irons of the ordinary construction, in which the profile of the moulding is formed on the edge of the steel, and a bevel ground backwards from it, some makers mill the form of the moulding into the face of the cutter itself, as if sharpened to the proper bevel, it thus always retains its true form. This form of profile may be secured for vertical spindles, no matter how badly the cutters are sharpened, by using solid circular cutters. These are made from one piece of steel, in form something like a deep saucer. The periphery of the steel is shaped to the profile of the desired moulding, and has several openings which are sharpened towards the centre, present as many cutting edges to the wood.

In forging or tempering moulding-irons important that they should be heated as ev as possible. If one part of the cutter is th than the other, care must be taken that the part does not heat more rapidly than the re it may be "burnt," and break off at the cu edge whilst in work. In heating cutter tempering, they should be repeatedly t over in the fire, and withdrawn from it nov then. If the cutting edge is heating too rap it should be pushed through the fire into c coals. If there are a number of membe the same moulding, great care should be cised in tempering them as nearly alike as sible, or they will vary in wear, and the p of the moulding be altered accordingly. important in tempering that there be a gr shading of colour. If there is a distinct between the colours towards the edge o cutter, it will probably chip at this line. point to aim at is to have the edge of cutter tolerably hard, and this hardness t gradually reduced the further you go fro cutting-edge, and the softer metal at the will be found to strengthen and support it.

The process of tempering should be gra as the steel becomes toughened and less liat fracture by slow heating and gradual softe than if the process be performed abru When the proper heat has been reached, the should be removed from the fire and not all to "soak" with the blast off as is somet done. Bear in mind, in forging, weldin tempering steel tools, that an excess of over what is absolutely necessary is detrime as it opens and makes the grain of the coarse. If a tough temper is required, the coo or letting down, should be as slow as poss The right temper colour varies with the stee the hardness required. Templeton gives following degrees of heat:—Chipping chi planing irons, hatchets, and other percussive 500° to 520°, light straw colour, a brown yell yellow slightly tinged with purple; 530°, purple. As the colours appear and ch slowly ample time is afforded to see whe exact shade of colour has arrived, when the c should be at once dipped and withdrawn se times; as this has a greater tendency to tou the steel than if it is plunged into water, and allowed to remain until quite col number of more or less reliable mixture used for tempering. We have found the fol ing answer very well:—Take 4 parts of powc yellow rosin and 2 parts of train oil, and fully mix them, and add 1 part of heated ta The object to be hardened is dipped in this and allowed to remain in it till quite cold. W out having previously cleaned it, the steel is a put into the fire, and then cooled in boiled w in the usual way.

SPEED OF CUTTERS.

In turning out high-class mouldings, question of the speed of cutters is of moment*; but exigencies of space prever here going into the question at length. thoroughly well constructed and equi machine, a speed of 4,000 revs. per minute be taken as a standard.

BALANCING THE CUTTERS.

Another matter of the extremest import in securing highly-finished mouldings is the balancing of the cutters. These should not be of same exact weight and overhang, bu cutters must be made to agree in their c sponding members to the greatest possible ni The importance of this will be readily recog when we consider the high velocity at w they have to run; consequently any inequi is enormously multiplied by the centrifugal set up, the result being transferred to the in the shape of jars and markings. When e cutters are put on, they should be put exact balance and kept so. In working elab mouldings, it is difficult to keep both irons a and one plan often pursued by the operator use an iron for each member of the mould and to balance the irons with beams and sc and when the iron projects, say, 1½in. to put rectangular washer. In working vertical sp machines, some operators will use one only, with a blank on the other side of the to balance.

* See "Saw-Mills: their Arrangement and Ma ment," by M. Powis Bale.

s already mentioned, in accurately balancing ers, not only should their specific weights e—which is a matter of little difficulty, as it be determined with a common pair of scales—the weights of the cutters should agree in r corresponding parts. This cannot be ascered accurately without the aid of a proporal cutter balancing machine, and several of e have now been introduced with very satisory results. In the best of these machines cutters can be tried one against another in y position, and if any excess of weight ears in any of them at any point in the backs, its, or edges, it can be detected and remedied.

DRIVING-BELTS.

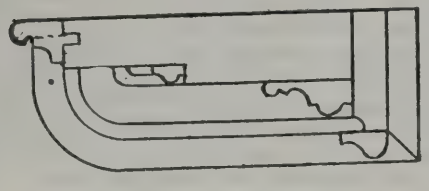
ll driving-pulleys should be of ample width the power they have to transmit without ining the belt, and, therefore, cutting out the rings. Wide single belts are preferable to ble, and the best leather to other material. s important that the driving-belts are kept as ble as possible. This is not a very easy tter in a saw-mill, owing to the very fine dust stantly floating about, and filling up the pores the leather. A mixture of mutton-fat and swax in equal parts will be found a capital ssing, and will not injure the belt. An apation of tanner's dubbin for leather, and of seed-oil varnish for cotton belts, can also be ommended. Castor-oil is also an excellent ssing for leather, and, at the same time, it ders it vermin-proof. It should be mixed, , half and half, with tallow or oil. For preving or recovering leather belts from mould, roligneous acid may be used. The belts should thoroughly stretched and carefully made. mented joints are to be preferred to others, as y run smoother over the pulleys.

CARPENTRY AND JOINERY.—XXXIX.

DOOR-FINISHING (*continued.*)

IN the last article, a somewhat elaborate *architrave block* was described; in this, a still re complicated one will be dealt with. Before ssing on to sketch additional features of doorishing in the shape of entablatures and pedients. It will be noted that the two principal ints of difference between the block described this article and that treated of in the last, e—first, the corner of the block nearest the or is rounded, instead of rectangular or *square;* d second, the moulding on the lower face of e skirting is continued round the architrave ock until it terminates, by being *scribed* into e scotia adjoining the bead on the inner (that ext the door) edge of the architrave.

Fig. 266 gives a plan of the architrave block, ith as few lines as possible, so as to avoid nfusion by overcrowding.



Let it be understood that this particular nishing was composed of pitch pine and teak, olished. The mouldings were all of teak, hilst the architrave plate and capping were itch pine; and this determined the composition f the block. The block itself was pitch pine, correspond with the *plate*, whilst, as before ated of the architrave, the mouldings around nd upon the base block were of *teak*. It will be ecessary, in order that the reader may have this lock before his mind's eye, to give its elevaion; and it will not cause any great difficulty to how it *broken*, as the block was $10\frac{3}{4}$in. high and he breaks occur in the plain surface.

The height, $10\frac{3}{4}$in., is to be understood as orming at that part a resting-place for the rchitrave-moulding proper, so that what is hown above that measurement is the return of he architrave upon itself and along the block.

It is a sectional elevation which is given, as it will be understood that the front elevation would n general be similar to Fig. 262—that is, the other architrave with the *square corner*.

Now when the plan is measured, it is found hat it requires a block 8in. wide and $3\frac{1}{8}$in. thick, and, of course, at least $10\frac{3}{4}$in. long; but allow, say, $\frac{1}{2}$in. at least extra for scribing to the floor. The method adopted to work this block was—having obtained the piece of the required size, and then planed it up to the finished size, the patterns were got out by which to work it, one pattern being that of the plan of the full size of the block with its rounded corner, and this served as its plan outline up to the ogee moulding which is continued round the block, and shown in elevation; its outline is also shown in plan in front of the capping of the architrave, but it is not seen its full thickness there, as it is *housed* fully an $\frac{1}{8}$in. into the block, which housing is shown in elevation. Above this ogee moulding the size of the block was reduced, and the pattern for it would follow the line inside of, and parallel to the front line of ogee moulding; or, in other words, would follow the line of the back of the ogee moulding, as seen

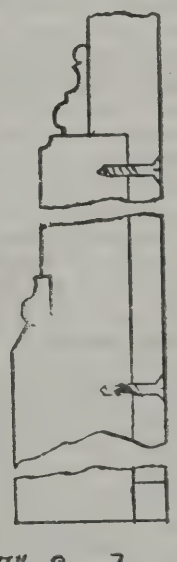


Fig 266

3" Scale

in the plan, which line, be it observed, takes no notice of the *housing* of that moulding, and which is shown in elevation alone. No further reduction takes place in the size of the block, so that a pattern got out to this will serve to work the upper portion of the block. One other matter in the working of the block: it requires to be trenched, so as to let the ogee moulding in $\frac{1}{8}$in. fully, as previously stated. If the joiner who is working the block has a *slide-rule*, just draws the slide out a full $\frac{1}{8}$in., and uses that as a depth guage to sink the trenching by, it will serve for a sufficient guide. He now requires a pattern to work the ogee moulding to, the lines of which he will obtain by putting upon the plan a line in the middle of the scotia, and parallel with the outer face of the block; then a pattern got out to a fraction within the outer face of the bottom portion of the block and the line just drawn, as above described—that is, a pattern that will fill in between these two lines

Fig 267

3" Scale

will just suit for the plan or pattern of the ogee moulding, and its thickness can be obtained from the *sectional elevation* (Fig. 267).

A section or piece cut off the end of the straight moulding, which it is presumed has been already wrought at the machine, will serve to mark the ends in order to guide in working the piece of moulding for putting round the block, so that it will fit in the trench cut for it.

It is to be noticed that a small chamfer occurs under the ogee moulding; this is seen in elevation. The scotia which occurs on the capping is continued along the block, and is shown in plan and elevation.

Of course, on the block it is carefully wrought what is termed *across the grain*, and is seen abutting against the plain sunk face of the architrave plate.

Carefully note the dotted line parallel with the back of the architrave plate, and extending inwards from the quirk of the bead. This shows a small *rebate* taken out of the back of the block.

The scotia alongside the bead, which is seen along the edge of the architrave plate, and is tongued into it, is taken away from where the ogee moulding will be scribed into it downwards, so as to fit this rebate, and one or two small screws are put in from the back, so as to fasten it tightly to the block. Before putting the screws in permanently, glue the moulding opposite the rebate. The tongue and groove, as also the remaining portion of the edges of the architrave plate and moulded slip, are glued, and a few screws put in from the back of the plate into the slip to hold it firmly to; these screws are put in *anglewise*, and a little taken out for the head, so that no obstruction will prevent the architrave bedding itself properly against the grounds, &c. The ogee moulding which is housed into the block has to be wrought by hand, as it would hardly be worth while to attempt it with the machine; but if it is tried at a machine it would be the "vertical spindle," and the piece should be wrought to the convex curve, then moulded and cut out at the "band-saw" to the concave curve, as also the straight portion connected; it is just as well to have sufficient of the straight attached to allow of its being mitred across the edge of the block. The mitre is shown in the plan, and the return piece is continued as shown, so as to be fair with the back of the block. In fixing the skirting, the corresponding moulding on the skirting is scribed to fit.

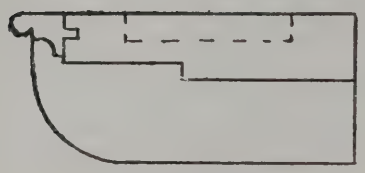
The particular skirting used in this case will probably be given among illustrations of skirtings, as it is a good example of a "double-faced" and somewhat heavily-moulded plinth. Two other portions connected with this block remain to be touched upon. The architrave moulding proper has to be wrought by hand too; the curved end is rather quick for any machine in use in joiners's shops, so far as is known to the writer, so a little pattern of the *plan* of the moulding is got out, the lines which bound it are seen in plan, and are those which contain the section of the moulding, and this section gives the thickness or depth of timber required to get it out. There should be no difficulty in working this moulding, providing the ends have been marked carefully with the section.

It is taken for granted that the piece to be moulded has been wrought neatly to the pattern got out as above. The sectional elevation shows the true position of the finished moulding, and, therefore, the way to place it on the piece in order to mark it for working. A little extra length should be allowed on both ends in case of mishap and for fitting, the straight end being mitred to suit the vertical moulding of the architrave, and the rounded end abutting against the sunk face of the architrave. Let it be noted that the inner curve on the back-side of the moulding requires to be accurately fitted to the rounded edge of the piece upon which the small ogee rests.

In the description of the architrave belonging to the former block, as shown in Fig. 262, the small moulding had a wrought *stop;* but in this case the horizontal piece of this moulding (the plan of which is seen) has its end rounded and mitres with the vertical moulding at the other end. A small piece with the *grain* to match the architrave plate has to be fitted, to rest the *return* of the small ogee upon; it reaches down to the block.

This is the second point to be noted, and concerns this *bedding* piece and the return, or horizontal portion, of the small ogee.

The bedding piece is glued and needle-pointed to, the needles are put in where they will be covered by the architrave moulding, which is also glued and needled to, and the small ogee is similarly dealt with.



The capping of the architrave is scribed to fit the scotia on the base block in a similar manner to the preceding case.

And now the method of attaching the block and architrave plate together remains to be stated, although this was slightly, if not sufficiently, dealt with in Article 29.

Fig. 268 gives a bare outline in plan, but sufficient for the description of the process. The

dotted lines show what is left on the architrave plate, and, as a matter of course, what is grooved out of the back of the block. For ease of working this is taken out right through the length of the block, and can be done either with a *grooving iron*, or a saw at the "circular saw and bench," providing the saw can be raised or lowered; of course, if that cannot be done, a packing piece of the required thickness can be laid on the saw table, so as that the saw shall be just sufficiently above this piece, as is required for the depth of the groove. This packing piece can be kept from pushing away by nailing two pieces to its underside at the exact length of the table. The portion of the architrave plate to fit into this

Fig 268

3" Scale

groove need not reach to the bottom of the block, as 1in. or 2in. may be saved in this way; but the bead and scotia grooved into the edge of the plate must extend to the floor. A good horizontal joint should be made between the block and the plate, and when all has been accurately fitted, the plate should be screwed to the base-block from the back-side, the heads of the screws being countersunk for. The front of the block must be parallel with the face of the architrave plate, as any departure from it would be readily noticed. The architraves are fitted up in the ordinary way apart from the peculiarities of the block, so that no further description is considered necessary. It will be obvious to every workman that blocks require to be paired (matched); but all the patterns are capable of being reversed, serving for either right-hand or left, according to which side is kept up. It is hoped that no difficulty will present itself, as this description is considered very full.

MR. JOSEPH NEWTON AND THE FOREMEN ENGINEERS.

MR. JOSEPH NEWTON, we regret to hear, has recently met with unexpected ingratitude at the hands of the officers of the London Association of Foremen Engineers and Draughtsmen. All who know the history of that society are aware that to Mr. Newton it owes its very existence, as well as its prosperity; and that, in fact, he converted it from a public-house gathering of foremen with "churchwarden" pipe accompaniments, into a delightful assemblage of engineers, over whom Lord Granville felt it an honour to preside! This in truth was the work of fully one-third of Mr. Newton's lifetime, for he spared himself no exertions, night nor day, to accomplish the object he had in view. It was through him that the Widows' and Orphans' and the Superannuation Funds of the society came into useful being, and are in active practice now. He also established, and for many years edited, a journal of the institution, *The Foreman Engineer*. This, however, failed through the apathy of the association foremen generally, and the forgetfulness of some to pay their subscriptions. Its failure saddled Mr. Newton with a heavy burden of debt, with a portion of which he is still encumbered, and which keeps him comparatively a poor man. These things are all well known to the officers of the association, and yet when he appeals to them for the small superannuation allowance—£12 per annum—they "fail to see" that he has any claim whatever as a "necessitous and old" member, and refuse to accede to his application! Such treatment certainly does not reflect credit upon the association.

Building Intelligence.

CRAIGELLACHIE, N.B.—A new distillery has just been built at Craigellachie-on-Speyside from plans by Mr. Charles C. Doig, of Elgin. The works are capable of manufacturing 3,000 gallons of spirits weekly, and include a warehouse, three stories in height and measuring 125ft. by 35ft., stillhouse, charge house, and offices. The chimney stack is 102ft. in height. The contractors were: Mason and brickwork, D. Forsyth, Elgin; carpenter work, A. and R. Dunbar, Craigellachie; plumber work, John Hunter, Elgin; concrete work, Scott and Sellar, Aberdeen; plaster work, Alex. Geddes, Elgin; slater work, John Wilson, Duff. Ironwork, Blaikie Bros., Aberdeen; James Abernethy and Co., Aberdeen; George Soutar, Elgin. Cast iron pipes, Laidlaw and Son, Glasgow; copper work, Robert Willison and Son, Alloa; painter and glazier works, J. Farquharson, Dufftown.

DENSTONE.—The dedication festival in connection with St. Chad's College, Denstone, and the celebration of the completion of the college buildings took place on Wednesday week. The foundation-stone of the new hall was laid in 1888. The hall itself forms the northern side, and the large schoolroom, with its wings, is the connecting link between them. The structure is in two stories, of which the hall proper forms the upper story. The inside dimensions of the hall are 93ft. long, by 30ft. wide, with a height of 18ft. to the cornice, and 35ft. to the apex of the wooden ceiling under the timbers. The hall is lighted on the south side by five three-light windows, and smaller lights in the eastern gable. The exterior is in unison with the rest of the college buildings, and is in the Early Pointed style. The work has been carried out from the designs of Messrs. Carpenter and Ingelow by Mr. Bentley, of Waltham Abbey. The cost of the work has been about £70,000.

EDINBURGH.—The work of constructing the Chambers Memorial Chapel in St. Giles's Cathedral has now reached an advanced stage in its completion. The chapel has been formed out of a building, till recently a vestry, which was erected against the north-east side of the transept, probably a short time after the Reformation. This building has now been thrown into the cathedral by a wide Gothic arch rising into the vaulting of the north aisle. The new groined stone ceiling springs from the four corners of the chapel and meets in the centre, with massive ribs, in a fine ancient carved boss, belonging to some portion of the old church of St. Giles. Corner columns with covered and moulded capitals support the ceiling. The removal of the plaster which covered the old east wall of the transept revealed the remains of a very fine Perpendicular window, sadly mutilated and broken. There were also discovered above the window, on the outside, the remains of the carved cornice that ran beneath the parapet, and many loose stones with carving, including a Norman capital. It is well known that there was a Norman porch at one time on the north side of the cathedral, unfortunately taken down about the end of last century. A careful drawing of it, however, which was made and can be found in Sir Daniel Wilson's book, reveals the fact that the capital found during the excavations clearly did not belong to this doorway. It is of quite a different, probably an earlier, type, and furnishes conclusive evidence that a church stood on the site in the 12th, or certainly early in the 13th, century. Another find, it will be remembered, was the arm bone, which caused a good deal of controversy. The construction of the chapel has been the means of greatly improving the lighting of this portion of the cathedral. The architects for the work are Messrs. M'Gibbon and Ross, Frederick-street, Edinburgh.

GATESHEAD.—Some 15 years ago the late Mr. Edward Joicey, of Whinney House, bought an iron church in London and presented it to the then Rector of Gateshead, who had it erected at the foot of the Windmill Hills. Service has ever since been conducted in the building. Lately, however, the iron casing has become so worn, and the whole building has got into such a condition, that it has become necessary to substitute a permanent church for it. Arrangements were started for the erection of a permanent building on the site occupied by the iron church, but it has been decided to erect the new building at the junction of Peterborough-street and Alexandra-road. The church will be known by the name of St. Mary's District Church of St. Columba. The architect of the new church is Mr. Stephen Piper, M.S.A., County Chambers, Newcastle, and the building will consist of nave, transepts, chancel, chancel aisle, organ chamber, and vestry, with heating-chamber underneath. The aisles are arranged so as to admit of future extension, but at first they will be used as passages. In the interior the walls will be plastered and relieved by an arcade of red brick, giving a striking and pleasing effect to the whole. The external walls will be of snecked rubble, with chiselled stone dressings. The roofs will be slated, and the windows, with the exception of the east and west, will have simple tracery with lead glazing. The style of architecture is a simple treatment of the 15th century, and, when completed, the church will provide sitting accommodation for about 400 persons. Mr. Jas. Joicey, M.P., will lay the foundation-stone at seven o'clock in the evening of the 30th inst.

LEAMINGTON.—The memorial stone of a school to be erected in connection with Spencer-street Congregational Chapel was laid on Thursday, the 23rd ult. The building, which will be situated on the west side of the chapel, will consist of a Sunday-school, with a lecture-room 47ft. by 25ft. 6in., and an infants' classroom 30ft. by 25ft. 6in., with lobby, cloakroom, and lavatories attached. The whole of the building will be in Kenilworth bricks, with Bath-stone dressings. Ventilation will be provided by means of inlet tubes and Buchan's exhaust ventilators fixed in the roof. Several alterations and improvements are also to be carried out in the adjoining chapel. The building will be enlarged at the north end by the formation of a chamber to contain the organ and choir. This will be lighted by semicircular-headed windows corresponding with the Classic style of the chapel. The organ will be removed from the south gallery into this chamber, and a new organ-case will be provided. On either side will be vestries for the minister, deacons, and choir, the present lecture-room being utilised for that purpose. The whole of the present cast-iron windows in the walls will be removed, and replaced by new windows of improved design, with tracery heads, and also filled with cathedral glass. The whole of the present pews on the ground floor will be cleared out, and their places taken by pitch-pine benches of more modern design. The lobbies at the south end are to be renovated and altered, with new staircases to the galleries, and pitch-pine doors with glazed upper panels. The architect is Mr. Victor Scruton, of 7, Waterloo-street, Birmingham, and the contractor Mr. John Fell, of Leamington.

LEIGH WOODS.—The foundation stone of St. Mary's Church, Leigh Woods, a hamlet of Long Ashton, was laid on Saturday. The church will consist of nave and chancel, and will accommodate 270 people. There will be an organ chamber and vestry, and beneath the latter will be the chamber for the heating apparatus. At the south-western angle of the nave there will be a tower, with gabled belfry over it, and this will be covered with oak shingles, will have oak barge boards, and be surmounted by an oak flèche. An oak porch adjoining the tower will form the principal entrance to the building. There will be a baptistery projecting from the western wall of the church. The walls will be of red Pennant stone both outside and inside, with Bath stone dressings. The windows will be of simple tracery, except the west window of the nave. The nave roof, of pitch-pine, will have a clerestory of oak dormer windows, with carved barge-boards. The roof of the nave is of open construction, and that to the chancel will be boarded and have moulded panels and carved leaves at the intersections. The east end of the chancel will be semi-octagonal in form. Mr. J. Medland, of London, is the architect, and Mr. G. Wilkins, of Bristol, the builder.

The death is announced of Léon Pelouze, one of the best of French landscape painters. He commenced life as a commercial traveller, and only took to painting at twenty-eight years of age. He was entirely self-taught.

A petty sessional court, with cells and residences for police, is about to be built adjoining the police station at King's Heath, near Birmingham, for the Worcestershire County Council, from plans by Mr. Henry Rowe, of Worcester, the county surveyor.

Engineering Notes.

The Andoversford and Cirencester Railway.—The new line from Andoversford to Cirencester was opened for passenger traffic on Saturday. Although its total length is only a little more than 14 miles, the Midland Railway Company, by using this line, will secure a route more than 40 miles shorter from Cheltenham, the north and west, to the South Coast. The line between Swindon and Andover was constructed some ten years ago; the continuation of the line from Swindon to Cirencester was opened about eight years ago, and the branch now constructed from Cirencester to Andoversford completes the entire system. Much of the work was of a heavy character. The cuttings are almost all of a stony nature, and in some places beds of hard rock were met with. The engineer was Mr. J. R. Shopland, C.E., and the contractor Mr. Charles Braddock.

Carville, Tyneside.—On Saturday, a new passenger station, named Carville, was opened on the riverside line at Wallsend. The contract for carrying out the work, which embraced both the passenger and goods station, was placed in the hands of Messrs. J. and W. Lowry, of Newcastle, Mr. Bell, the company's architect, having prepared the design for the structure; the length of the frontage to Hadrian-road is about 160ft., the entrance being by an arched portico of dressed freestone. The outer walls are of red brickwork with freestone dressings, the interior walls being inlaid with enamelled brickwork. The offices and waiting-rooms are on the north side of the line, and access to the south side is obtained by a subway, also faced with enamelled brickwork. The booking hall, which is in the centre of the building, is surmounted by a clock tower, the general waiting-room forming a projecting wing on one side, and the ladies' room and lavatories on the other. Between these wings a verandah, having plate-glass roof and front, extends the entire length of the building. The platforms, which have been laid with concrete, are exceptionally wide, and extend over a distance of about 460ft.

CHIPS.

The Earl of Stamford laid, on Wednesday week, the foundation-stone of the new chapel at Bradfield College, Berks. The chapel is being added at a cost of £3,800.

Building operations will be at once commenced in connection with the Priory of the Benedictine Order at Edge Hill, Lancs. The architects of St. Anne's are Messrs. Pugin and Pugin.

The new railways through South Clare are making steady progress. A line is being made connecting Kilrush, Kilkee, and Milltown Malbay. Messrs. Griffin, Gelston, and Gray are the engineers, and Mr. W. Martin Murphy, M.P., of Dublin and Bantry, is the contractor.

The honorary degree of Doctor of Laws was conferred by Edinburgh University on Monday on Col. Sir Colin C. Scott Moncrieff, of the Royal Engineers, for his services to India as chief officer of the irrigation works on the Nile.

Litigation is threatened against the corporation of York by Mr. Bottoms, the late contractor for the sewerage works now in progress, for stopping him in the execution of contract for the works. The claim is for loss of profit, detention of plant, damage to trade and reputation, &c., and the damages are laid at over £10,000.

The name of Mr. John Edward Wright, architect and surveyor, of Wilson-Patten-street, Warrington, has been added to the commission of the peace for that borough.

The commencement has just been made of a large board school, which the Benwell School Board is building at South Benwell. The school is planned to accommodate 1,472 children, and is also provided with spacious cooking room, fitted up with all the latest improvements. A large marching corridor has been provided for the infants. The floors are carried on built girders and arches, and covered with wood-block flooring. A handsome suite of offices is provided for the board and clerk to the board, also a caretaker's house. The total length of the two main frontages will be 342ft. long and two stories high. The building will be of stone, and will cost £13,000, excluding land and furniture. The plans were chosen in a limited competition. The architect is Mr. Jas. W. Thompson, of 55, Pilgrim-street, Newcastle-on-Tyne. Mr. Dodds is clerk of works, and Messrs. J. and W. Common are the contractors.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., LVII. LVIII., and LIX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—J. Palmer (Bristol).—E. and S. Co.—Talbot.—W. J. M.—F. B. Co.—Justitia.—G. S. T.

Correspondence.

GREEN v. ARCHER.

To the Editor of the Building News.

Sir,—In the last issue of the R.I.B.A. *Journal* the following paragraph, somewhat mysteriously inspired, finds a place, which I extract verbatim:—"The attention of the Council having been called to the case of 'Green *v.* Archer,' reported in the R.I.B.A. *Journal* (p. 359 *ante*), they have formally declared that in cases of partnership between architects it is neither proper nor professional for one partner to claim, except with the expressed concurrence of the other, the entire credit of a design executed by the firm." This is extracted from the R.I.B.A. *Journal*, but as I may be individually *in nubibus* upon the subject, not having followed very closely of late either the R.I.B.A. or other professional journals, I feel somewhat anxious to know whether this excerpt is the mode or channel of communication which the Council have adopted to communicate their formal pronouncement upon this question to the profession, or whether we are to look for another. Personally, I have seen no other, and was somewhat astonished, on the appearance of the paragraph in question, to discover that sufficient pressure had been brought to bear upon the Council to compel it to deliver itself of this magisterial dictum. However, all things come to those who wait, and probably in the course of time members of the Institute will be amply satisfied with the reception of another R.I.B.A. encyclical embodying this very formal pronouncement, with the gratifying information conveyed on the cover that copies can be had on application at No. 9, Conduit-street, on payment of the sum of 6d. each, and, like other encyclicals issued by the R.I.B.A. which cost three farthings to produce, and which are tendered to members of the profession for *sixpence* each, will be very much in request. But apart from the financial aspect of the question, which at best is a sorry one, what about the decision itself? Doubtlessly the Council sat as judge and jury upon this important question; but how was the decision arrived at, upon what basis from either a professional, ethical, or commercial standpoint of view is it founded? One can sympathise with the Council of the R.I.B.A. being empanelled for many days over this *vexata quæstio*, but the profession desires to be made acquainted fully with the details of the case, the nature of the evidence tendered, and to be supplied with something more than the rag of a document by which the information has been so oracularly communicated. Questions of partnership, like questions of party-walls, are all very well in their way, and although, like ancient lights, they supply us with many evil bones of contention, there is not much meat extracted from them, but a fund of useful information when our analogical perceptive faculties have free and full play. Generally considered, party-walls may vary in the characteristics without limit; but fundamentally considered they are subject to such generic distinctions as to enable one to discern in which category each may respectively be placed. Everybody is well acquainted with that species of party-wall which belongs to nobody, nobody can produce a title to it, not even the adjoining owner, no boundaries having been delineated on the title deeds. In such a case the adjoining owners enjoy the use of the wall in common, neither of them being at liberty to sell, raise, vary, alter, dispose, or otherwise alienate the other's interest in it. Their legal right is defined as an undivided moiety, and *both* possess the right of the user of the wall as a whole and in its entirety. Such a position, it must be avowed, is unique. And while they enjoy the privileges they equitably share the responsibilities, as might be reasonably supposed.

I take it that no one would dream of asking as to *who* designed the Victoria Law Courts at Birmingham, such a question being impertinently inappropriate, and would display an overwhelming density upon the laws appertaining to architectural partnerships. There is no question as to who undertakes the responsibilities inseparable from such an undertaking, each of the conjoint architects being held individually responsible for the success of the building in its entirety; and as their partnership carries with it an undivided moiety in the share of the responsibilities entailed, it inevitably carries with it an undivided moiety in the share of all privileges and architectural credit which may accrue from the success of the undertaking; that is to say that their respective share in the success of the undertaking consists of an undivided moiety in which each has a right and privilege to the whole.

In the case of an architectural partnership such as that of Messrs. Archer and Green, which has been established of old, the interest of either party in the credit of the designs carried into execution consists, of course, of an undivided moiety, *each* enjoying the privilege of the whole; but if they are to be called upon to take up the illogical position assumed by the Institute, the element of unlimited discord is to be introduced and let loose. If a partner in a partnership, proceeding upon the lines laid down by the R.I.B.A., cannot, save with the expressed concurrence of the other, claim the credit of a design in its entirety, he must, perforce, content himself with the credit of a part. Now, the question for the R.I.B.A. to solve is, *which part?*

—I am, &c.,
Chas. R. Guy Hall.
13, St. Alban's-road, Kensington, W.

VERTICAL SHEARING STRESS.

Sir,—Will you allow me, through your pages, to correct the prevalent error of supposing that the vertical shearing stress at the centre of a beam carrying either a central or distributed load is nil?

Let us first examine shear, and the conditions under which it can take place.

Shear is the result of *two* forces opposing each other on *opposite* sides of a plane—otherwise it would be compression; such forces are not necessarily in contact with the plane. They may be transferred to it; but the actual shear must take place about a plane. The forces must be opposite in direction and equal in

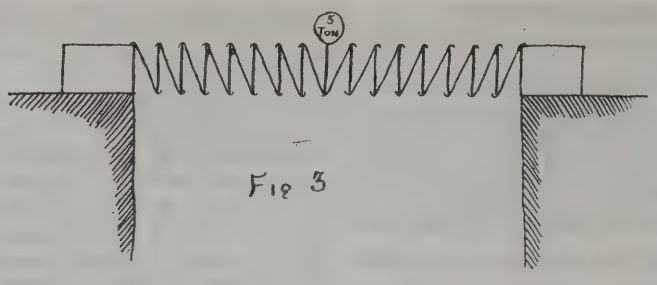


Fig 3

magnitude; if not equal, the whole operation would move in the direction of the greater. Shear must be either single or double; single = half the total load, double = the load. And, lastly, vertical shear can only treat of vertical

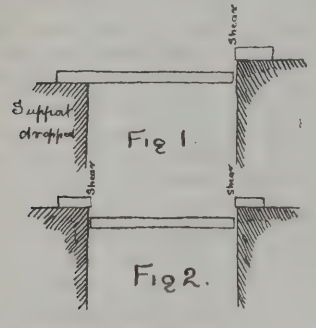

Fig 1.

Fig 2.

forces, and be brought into operation under one of the following conditions: Either one support must give way, as in Fig 1 (this gives single shear); or both supports remain and the beam pass between, as in Fig. 2 (this gives double shear). If the beams were rigidly fixed to the supports, single or double shear may take place at any point or points within it; this is highly improbable in practice, but may be considered in theory. If these points are correct, the principle of using the reactions at the supports obtained by taking moments around each is wrong, because none but *vertical* forces can be considered. Some authorities give the following rule of obtaining the vertical shearing stress at any point—i.e., represent the upward and downward forces by opposite algebraic signs, and the total on either side (not both) of a section gives the required stress. This also is wrong, because you must have forces on *both* sides of a plane to produce shear, and these must be equal, whereas the above mentioned rule would give different results on the alternate sides of the same plane (*primâ facie* wrong).

However, I will give my theory, which is that a beam supported at end may for all purposes of vertical shear be considered as so many vertical planes, bound together by natural cohesion; for experiment we may break this natural cohesion by separating the planes, and supply its place with cords, see Fig. 3. The vertical lines show planes which in practice would be in contact, and the sloping lines show cords supporting the same; in practice these would be replaced by natural cohesion. It will be seen that each plane bears $2\frac{1}{2}$ tons (this would be true, however close the planes were together), and that the supports must each offer a reaction equal to this. We also see that, to shear at the centre, the load must *split* and give us a shear of $2\frac{1}{2}$ tons; but this is evidently the same as would be given at any point between the centre and reactions, therefore the tendency to shear remains constant throughout the beam, and does not converge to nil at the centre. Practically no load would divide itself; therefore the central plane (or planes) would be supported at each side (or outer sides), which would equal two single shears, or 5 tons, for the double shear. A large-scale drawing on the principle of Fig. 3 will show that a beam, no matter how loaded, will give a *single vertical shear* at any point equal to half the total load. A diagram showing this very clearly may be prepared by using different colours to show the different cords which support each load.—I am, &c.,

William C. Bolt,
Royal Engineer Establishment.

The Theatre Royal at Newcastle-on-Tyne was reopened on Monday, after having been redecorated and altered, from designs by Mr. W. Lister Newcombe, of that city.

Intercommunication.

QUESTIONS.

[10597.]—**Mathematical Tiles**—Can any of our readers favour us with the address of the present makers, if any, of buff mathematical tiles? These were used largely on East Kent mansions about a century ago, and we are wishing to match them.—Builders.

[10598.]—**Hire of Scaffolding.**—Will any of your many readers kindly give me some information in reference to the following? I have been letting a quantity of the above, such as poles, boards, cords, ladders, crabs, &c. I should be glad to know the customary way of charging for the same.—A Subscriber.

REPLIES.

[10583.]—**Sketching Tour.**—To Vernon Crompton.—Thank you very much for your reply to my query in the Building News *re* sketching tour. It is just what I require. I shall be glad to receive any information, if it is not giving you too much trouble. I prefer plenty of walking, and hope to drop across some of the old posting inns.—John B. Mason, 9, Mill Hill-road, Derby.

[10586.]—**Damp Rot.**—There is no effectual remedy for this but by arching over in half-brick in cement or concrete on iron girders and relaying the tiles. These should never be laid on timber.—Jas. Pulham.

[10587.]—**Damp.**—The damp through outside wall cannot be stopped by stripping off the plastering or anything inside. It must be done on the outside by well cementing; but if it rises from the wet ground, nothing but a damp-proof course will stop it, and this is a very expensive work.—Jas. Pulham.

PARLIAMENTARY NOTES.

The Chantrey Bequest.—Mr. De Lisle asked the Chancellor of the Exchequer on Monday whether the new buildings proposed to be added to the South Kensington Museum included "suitable accommodation for the pictures of the Chantrey bequest; what was the number of pictures already purchased under the terms of the Chantrey bequest, and their estimated approximate value: and whether, in case the estimated value of the pictures was greater than the estimated cost of providing suitable accommodation, Her Majesty's Government would take steps at once to carry out the terms of the Chantrey bequest, with the view to acquire a full title to the possession of the pictures as the property of the nation."—The Chancellor of the Exchequer: No special provision has been made in the plans of the new buildings to be added to the South Kensington Museum for the Chantrey bequest pictures; but the additional space which will be at the disposal of the Science and Art Department will enable them, if the pictures remain with them, to hang them to better advantage. Fifty-four pictures and seven works of sculpture have been purchased under the terms of the Chantrey bequest, at a total cost of £39,245. The subject of the last part of the hon. member's question must be considered in connection with the proposed British Art Gallery, and I cannot at present give any undertaking with reference to it.

Westminster Abbey.—Mr. Shaw Lefevre asked the First Commissioner of Works whether he would lay before the House the designs which Mr. Pearson, R.A., prepared for the Royal Commission on Westminster Abbey for a monumental chapel on the site of the houses in Old Palace-yard, and also the evidence which Mr. Pearson gave in support of them; so that a full comparison might be made between this scheme and that for a chapel on the refectory site. Mr. Plunket replied that Mr. Pearson's designs were prepared by him for the Royal Commission on Westminster Abbey on the understanding that they should be treated as confidential. The evidence referred to in the question was given long after the general evidence had been closed, and when the Commissioners were actually engaged in considering their final report. In these circumstances, the designs could not be exhibited in the report. He had not the smallest objection to Mr. Pearson publishing his designs—which were merely sketch designs—in any way he might think fit. The only design in relation to the refectory site was one suggesting a possible treatment of the interior.

The governors of the Radcliffe Infirmary, Oxford, have decided to erect a new male ward, and to rearrange the old block for administrative purposes.

LEGAL INTELLIGENCE.

Appeal Court under the Metropolitan Building Acts.—The Tribunal of Appeal in cases under the Metropolitan Building Acts, organised under the London County Council General Powers Act of last year, held its first sitting at Spring Gardens on Friday. Mr. Arthur Cates, V.P.R.I.B.A., the referee nominated by the Royal Institute of British Architects, occupied the chair, the other referees being Mr. R. C. Driver (nominated by the Surveyors' Institution, of which society he is ex-president), and Mr. John Hutton, chairman of the Building Acts Committee, L.C.C., representing the latter body. The court is formed, it will be remembered, for the purpose of affording appeals from the decision of the superintending architect to the County Council as to lines of building frontage.——In the first case heard, Mr. G. C. Barratt, the owner of No. 147, Stroud Green-road, appealed against a decision of the superintending architect, Mr. Blashill, as to the general building line in that road. It was stated that under the discretionary powers granted under section 75 of the Metropolis Management Act, 1862, the County Council had already granted dispensing powers for a certain encroachment in the road, and when the appellant made application to bring his building out to the same line it was refused. Mr. R. C. Glen, instructed by Messrs. West, King, and Adams, appeared for the appellants, and called Mr. F. L. Pither, the owner's architect, and a number of freeholders and leaseholders in the neighbourhood, to support the application. For the respondents, the Vestry of Islington, Mr. J. P. Barber, the vestry's surveyor, made an able speech, contending that a dispensing authority for encroachments given by the council in one or more instances did not affect the general building line. The Court reserved its decision.—In the second case, Mr. D. A. Thomson appealed against the building line sought to be laid down at the corner of East-street and Kennington-road in the case of the Bricklayers' Arms public-house. Mr. F. Besley, Q.C., appeared for the appellants, and raised the preliminary objection that the issue of a certificate of the superintending architect would in this case be *ultra vires*, as they had no authority to define a building line in an old street that existed before the first Metropolitan Building Act of 1855, as in the important case of "Lord Auckland v. the Westminster District Board of Works" (26 Vic. "L. T." New Series, August 31, 1872). In the case of old thoroughfares existing before 1855, where there was curtilage, the council could not set back except compensation be given. Mr. Cates pointed out that the appellant had practically submitted to the Council, as he had made application that a building line should be defined. Mr. Besley said, without waiving his rights by yielding this point, his client would submit to any decision that the Court might arrive at. He would further point out that under the 74th and 75th sections of the Act of 1862 it was lawful for the County Council to require buildings when rebuilt "to be set back to such a line and in such a manner for the improvement of any street" as they might direct. Now as Kennington-road was 79ft. 6in. wide at this point, he contended that no setting back could be for the "improvement" of the thoroughfare. The road was gradually altering in character, and would, there was no doubt, cease to be a residential neighbourhood. In this case the proposed new licensed house would replace premises that had been built since 1786. In a long thoroughfare like Kennington-road the line of frontage should be set out, not according to the whole length of the road, but in separate sections. In this particular case his client would be quite willing to accept as a section the portion of the road between East-street and Tracey-street, and to take the parsonage built in 1872 as the line of frontage; this course would involve setting back 12ft. from the present pavement line. Mr. Besley called Mr. W. T. Hollands, F.R.I.B.A., of Temple-chambers, E.C., who produced plans of the site and premises and large-scale models of the buildings proposed to be erected. For the Vestry of Lambeth, the respondents, Mr. Smith urged that the frontage line must be taken for the entire line, and not in sections. Mr. T. Blashill, the superintending architect to the County Council, was called, and stated that in his duties he had nothing to do with consideration of changes in the character of neighbourhoods, but simply to define the building line. He could not accept the parsonage as the "general" line. The chairman said the Court would give careful consideration to the points stated by Mr. Besley and Mr. Smith.

An Extraordinary Case.—At the Liverpool Assizes, on the 29th ult., an action by David Rimmer, builder, of Prescot, against Thomas Bennett, a gardener, of Bromborough, was tried, it being to recover £210, balance of money due for work done. The defendant counterclaimed for £170. The dispute arose out of a building contract which plaintiff alleged was entered into as far back as 1880. He had built houses and obtained a mortgage for the defendant. He produced the deed and books, and also a bundle of receipts, said

o have been given for various sums of money paid s interest on the mortgage by the defendant. The atter had paid him £200 in 1880, and a similar sum n the following June. The defendant, when alled, said that he earned 18s. a week, and in 25 ears he had saved £176, which was in a bank. The plaintiff advised him to draw it out, and said hat if he would let him have the money for twelve ears he would at the end of that time receive an ncome of £1 per week. He trusted Rimmer, and gave him £170. He had signed various papers for Rimmer, but did not know what he was signing. He did not know Rimmer was building houses for him. He never gave instructions to have a mortgage drawn up. He never wrote the figures in the book produced. Rimmer had always warned him against lawyers. He had often written letters as coming from himself to Rimmer, and the terms of these letters had been dictated by Rimmer himself in defendant's house. The learned judge, in summing up, said it was the most extraordinary case he had tried. The plaintiff came and spoke to a state of things going on for twelve years, and the defendant came and told a contradictory story. The curious part of the case was that, if the plaintiff was wrong, then he had throughout the dozen years been acting in an extraordinary way. He had been courting persons to execute deeds, sign mortgages, had paid moneys, given receipts, and made entries in books all entirely false—the whole thing had been a fraud, and yet the plaintiff had managed to go on for twelve years with what must be a swindle. On the other hand, if the defendant was wrong, he had been concocting a lie consistent in every particular with details extending over the twelve years.—The jury found for the defendant, and intimated that the plaintiff must pay back to the defendant the £170 counter-claimed for.

Re Philip Shrapnel.—(London Bankruptcy Court, July 29, before Mr. Wildy, Official Receiver.)—The debtor, described as of 103, Cheapside, and elsewhere, states that since December, 1889, he has been business manager of various companies. Prior to 1889 he was manager and secretary to the Building Trades' Exhibition held at the Agricultural Hall, and has also been organiser and manager of exhibitions in the provinces. The liabilities expected to rank are returned at £3,056, and the assets are of doubtful value. It was stated that the debtor had been adjudged bankrupt, and the chairman intimated that he should apply for an order for summary administration.

Lord Campbell's Act.—Faint v. the Metropolitan Improved Dwellings Association.—This was an action tried in the City Court on the 28th ult., under Lord Campbell's Act, brought by Mrs. Faint, a widow residing at Enfield, to recover damages for the loss of her husband through alleged negligence. The damages had been agreed at £50 in the event of a verdict being returned for the plaintiff. In December, 1890, the plaintiff lived with her husband at some model dwellings, known as Enfield Buildings, Hoxton. The rooms occupied were on the ninth floor of the building. One night in December last year, the plaintiff's late husband came in at about half-past eleven. The lights were all turned out, it being customary for the defendants to turn them out at eleven o'clock every night except Saturday, when they remained in till twelve. The plaintiff went upstairs in the dark, slipped, and fell down a flight. A month afterwards he died from a broken rib and pleurisy, the result, as it was alleged, of the fall, hence the action. For the defendants it was submitted that there was no case to go to the jury, on the ground that the deceased man was well aware of the defendant's regulations as to the lighting of the building, and that by going up the staircase after the lights were out, he took the risk of doing so upon himself. The learned Judge held that the argument was a good one, and said that his duty was clearly to enter a nonsuit. After some further argument, he asked the jury to say whether or not in their opinion the defendants acted unreasonably in leaving the staircase unlighted. The jury answered this question in the affirmative. The learned Judge then entered a nonsuit, and on the finding of the jury gave leave to appeal.

In re R. T. Hookway, of Bideford.—An adjourned meeting of the creditors of Mr. R. T. Hookway, a builder and contractor, and an alderman of the borough of Bideford, was held on the 29th ult. at Barnstaple. The statement of accounts showed a surplus of over £3,000, this being principally made up of surplus of securities over the amount of the debts. The first meeting was held at Taunton, and was adjourned to Barnstaple in order that the Official Receiver might communicate with the Board of Trade with reference to a proof of the Devon and Cornwall Banking Company for £1,203. The Official Receiver now stated that he should admit the proof only for the purpose of voting that day, so that the question would be fought out in the courts. Subsequently the debtor was adjudicated a bankrupt. Mr. Barrett, of Barnstaple, was appointed trustee, and a committee of inspection was appointed.

Glasgow Arbitration Case.—An arbitration case, which is expected to last till Saturday, was commenced on Monday in the Windsor Hotel, Glasgow. The operations of the Commissioners, who purpose bringing water to the city from the new reservoir at Craigmaddie by means of four 36in. mains, and by way of Balmore-road, involve upwards of two acres of land along the edge of Possil Marsh, the property of the late William Graham, of Lambhill. The trustees claim £3,000, and the advisers of the Commissioners, considering that £1,500 was sufficient, offered that sum, which was declined. Mr. James Thomson, architect, Glasgow, is the arbiter chosen for the claimants; while Mr. James Drennan, land valuator, Ayr, has been selected by the Water Commissioners; Mr. Alexander Moore, C.A., Glasgow, being the oversman.

Extraordinary Assault by Builders on an Architect.—At Westminster Police-court, on Wednesday, Messrs. John and Edward Brown, builders, carrying on business at York-street, Westminster, were summoned for assaulting Mr. William Macey Seaman, an architect, on the 23rd ult. Mr. Bagot Harte appeared for the complainant, and Mr. Pawley defended. Mr. Harte said that Mr. Seaman was a well-known architect, and had on several occasions done work for the defendants. On the date alluded to the defendants came to his office at 2, Victoria-mansions, Victoria-street, and were shown into the complainant's private room by his clerk. When Mr. Seaman entered, the elder defendant, John Brown, produced a statement for £19, which complainant had sent to defendants a few days before, and told him that he must receipt the document. Mr. Seaman expressed his willingness to do so if the money or a cheque were handed over. The defendants said they wanted a receipt without the payment of the money, and took off their coats to force or fight him. In the scuffle that ensued one of the defendants struck Mr. Seaman upon the face. The conduct of the defendants throughout was most outrageous The complainant said he had had a lot of difficulty with reference to his accounts with the defendants. He was much astonished when the Browns demanded a receipt before they settled the bill; but John Brown coolly remarked, "Well, you are getting some money out of one job, and you ought to let us have this £19 job for nothing." He declined to append his name to the bill, and defendants said, "Then we will knock your —— head off." Their language was most disgusting. If his clerk had not come to his assistance the defendants would, in all probability, have inflicted some serious injury. Harry Elkins, clerk to Mr. Seaman, gave similar evidence. For the defence Mr. Pawley endeavoured to prove that Mr. Seaman was the aggressor, and denied that Messrs. Brown made the extraordinary demand mentioned. The defendants went into the box and gave evidence to this effect. Mr. Biron said he was convinced that the defendants went to Mr. Seaman's office with the intention of creating a disturbance, and he should bind each over in the sum of £25 to keep the peace for six months.

The foundation stone of a Conservative Club and Ford Memorial Hall for Bedminster, Bristol, was laid on Tuesday by Viscount Cross. Mr. A. Beaven, of Bristol, is the contractor.

The Accrington Town Council decided, on Wednesday, to purchase Oak Hill Estate for a public park, at a cost of £9,500. Oak Hill was formerly the residence of the Hargreaves, and the grounds, thirteen acres in extent, are well timbered. The owner, Mr. Reginald Hargreaves, offered land at 1½d. per yard, but the Corporation refused to buy, although the ratepayers had polled in favour of the purchase. The owner conceded two years' grace, and offered to give £1,000 towards laying out the ground, and on these terms the Council determined to purchase.

Dr. Westcott held an inquest on Monday at Clerkenwell Coroner's Court, on the body of Frederick Daniel Smith, aged 75, master builder, of 85, White Lion-street, Pentonville.—The deceased, on Wednesday evening, left home in good health, and an hour afterwards he was seen to stagger, and fall face downwards in the road in James-street, South Islington. He was at once picked up, and as the police judged that he was suffering from the effects of drink, he was placed in an ambulance, and conveyed to the Upper-street Police-station, where he gave his correct name and address. He was charged with being drunk, and was detained in a cell until 3 a.m., when his sons took him home. Subsequently he was attended by Mr. W. H. Day, who said he had long known the deceased as a steady, sober man. He became unconscious, and died on Thursday afternoon, a post-mortem examination showing that death was due to apoplexy.—A verdict in accordance with the medical evidence was returned by the jury, who added that deceased was not intoxicated at the time of his seizure.

WATER SUPPLY AND SANITARY MATTERS.

Glasshoughton Waterworks.—At a meeting of the Pontefract rural sanitary authority held on Saturday last, tenders for the execution of the waterworks scheme, designed by Mr. Malcolm Paterson, M.Inst.C.E., of Bradford, were opened, and that of Mr. J. R. Maw, of Hull, accepted. The total cost of the scheme will be about £1,200. At the same meeting the engineer was authorised to appoint a clerk of works.

Pollution of the Aire and Calder—Soothill Nether Drainage.—The Local Board of Soothill Nether, near Dewsbury, have accepted tenders for the execution of the scheme of drainage designed by Mr. Malcolm Paterson, M.Inst.C.E., Bradford, amounting to the sum of £10,100. The district is a manufacturing one, with a heavy discharge of trade refuse of a very noxious kind from woollen factories. At present there are practically no drains except rubble surface channels, designed for top water, and the scheme consists of (1) about 12,000 yards of brick and pipe sewers, gathered into two outfalls to a single point by gravitation, of which nearly one-half will be laid through private lands under difficult circumstances; and (2) works for the treatment of both domestic and trade refuse. The system will be lime precipitation in tanks, and deep filtration through four acres of alluvial silt well adapted for the purpose. The lime-mixing material is designed to be entirely automatic, including the propulsion of the lime powder, the agitation of the milk of lime, and the blending with the sewage, the whole being worked by sewage power.

STAINED GLASS.

Market Weighton Church.—A memorial window to the late Drs. Matthew and Alfred Jackson has just been placed in the south aisle of this church. The subject of the window is "Christ Healing the Sick." The work is from the studio of Messrs. Powell Brothers, of 30, Park-square, Leeds.

CHIPS.

The committee promoting the celebration of the Grammar School Tercentenary at Halifax, have conditionally entered into contracts for the erection of a memorial building to provide accommodation much needed to extend the usefulness of the institution. The plans for the proposed new buildings have been prepared by Mr. George Vialls, of Ealing, London (an "old boy") and Mr. William Watson, of Wakefield, will carry forward the work, acting as local architect. Contracts have been let for £2,036. The new buildings will be of stone. It is proposed to lay the foundation-stone on the tercentenary day.

Alterations and additions to the Catholic church and presbytery at Aberdare, and to the schools at Ebbw Yale and Treforest, will shortly be carried out from the plans of Mr. Charles C. Jones, architect, Cardiff.

Among the measures which received the Royal assent on Wednesday were the Public Health (London), Public Health (Scotland), Schools of Science and Art, and the Hanover Chapel Bills.

The trustees of the Derby School of Art have made a free gift to the corporation of the school and site, which, with the appliances, are valued at £14,000. The corporation accepted the gift on Wednesday, and resolved to spend £12,000 in extensions of the schools for the purposes of technical education.

The members of three committees of the Town Council of Glasgow made an official visit on Tuesday to the site of the new park for the north-western district of the city. The grounds are situated on the elevated lands of the estate of Ruchill, between Possil Park and Maryhill. The property extends to ninety acres, and was acquired at a cost of £54,000, being at the rate of £600 per acre. At present it is proposed that 55 acres shall be devoted to recreation purposes, and the remaining 35 acres utilised in the construction of an hospital, modelled on the lines of the one at Belvidere, which cost £100,000.

The municipal corporation of Bombay have now under consideration a code of building by-laws for that city. A series of special meetings of this body were held in July for the purpose of fully considering the draft by-laws, and after much discussion the code has been finally approved.

The death of Mr. Vincent W. Voisey, F.R.I.B.A., of Foster's-chambers, Small-street, Bristol, took place at his residence, Swiss Lodge, Durdham-park, on Friday. As a church architect he did some high-class work. He recently published a book of architectural and other sketches of Continental and other cathedrals, &c. He was at one time a Bristol Cathedral boy, and became a Fellow of the Institute of British Architects ten years ago.

Our Office Table.

Several important alterations have been made in the technological examinations for the session 1891-2, held by the City and Guilds of London Institute. The syllabi in the classes of electric lighting, telegraphy, and photography have been re-written, entirely or in part; practical tests have been added to both grades of the examination in the last-named subject, and the syllabus in mechanical engineering has been revised. Three subjects have been added to the programme—viz., goldsmiths' work, ship carpentry and ship joinery, in each of which practical work is required. The lists of works of reference have been revised, and some modifications have been made in the rules. All these and other particulars, together with a list of prize winners at the recent examination, will be found in the official "Programme of Technological Examinations," published for 6d. at Gresham College, E.C., and the Guild Offices in Exhibition-road, South Kensington.

At the last meeting of the London School Board, a letter was read from Mr. Charles Cox, whose tender for the erection of a school in Chisendale-road, Bow, was accepted in March last. Mr. Cox said: "As the protracted strike of carpenters and joiners seems even now far from settlement, and the best time of the year for building operations is rapidly passing away, I beg to inform you that I am willing to sign the contract for above, providing the Board will agree to allow me the increased cost of labour, should the men succeed in obtaining their present demands, which I estimate at £647 over and above the amount of the tender. Of course, if the carpenters succeed, all the other mechanics and labourers will follow as a necessity, as it would be impracticable to make a difference in the hours of labour between the men. You will also see by the list of tenders that even with the amount herein added to my tender, it will then be less than the next tender (Messrs. Holloway Bros.)." It was decided to accept Mr. Cox's tender at £17,259, and to allow a sum not exceeding £647 in the event of the carpenters' strike being successful, the exact amount to be determined by the Measuring Surveyor to the Board on the completion of the works. The total cost per head of this school, without the possible addition now sanctioned, and exclusive of site, will be £23 12s. 3d., and £14 10s. for the mere shell buildings, not reckoning teaching-rooms, foundations, fittings, or fences.

By the death from accident on the railway at Walkerburn Station of Mr. Robert Mathieson, Runic House, Innerleithen, the district has lost a highly esteemed and useful public servant. Mr. Mathieson was a native of Peebles, and since his establishment in 1871 as an architect and builder in Innerleithen, has done much good work in that and the neighbouring counties. He was widely known as a geologist, an astronomer, and naturalist, and has been termed the Hugh Miller of the South of Scotland. As an archæologist he knew every old kirk, broch, stannin' stane, battlefield, camp, fort, and castle peel for 30 miles round, and had discerned the vestiges of Roman, Celtic, Welsh, and Early British occupation all over the Borders.

Mr. Jonas Nichols, J.P., died at his residence, Brinton's-road, Southampton, on Thursday night in last week, as the result of a chill taken on Tuesday when on business in London. Mr. Nichols was born at West Chinnock, in Somersetshire, in 1836, and at an early age was apprenticed to a cabinetmaker and upholsterer. Completing the term, he went to Southampton in 1859, obtaining employment at Mr. S. Stevens's building establishment at Northam. He eventually entered into business on his own account in a small way in St. Mary-street as a cabinetmaker; but later on he commenced in the building trade. He purchased a piece of land, and on this built a number of small houses for the working class, and eventually he acquired the glebe land in St. Mary's, and built the property now so well known as Nichols Town; of late he has been specially connected with the building operations at Eastleigh, where he owned considerable property. Since 1879 he had been a member of the Southampton town council.

In the report of the L.C.C. Committee on Main Drainage it is stated that, during last year, 111,105,505 tons of sewage have been treated at the Barking Outfall, and the quantity of sludge obtained after precipitation has amounted to 421,500 tons of 92 per cent. moisture, including 11,728 tons weight of chemicals used. The cost of fuel used was £6,774, and that of iron £2,641. At Crossness, where only a small proportion of the sewage is treated, the intermittent precipitation has resulted in the treatment of about 19 million tons, the quantity of sludge obtained being 77,513 tons of 90 per cent. moisture. The quantity of sludge taken out to sea from the two outfalls by the Council's sludge ships has been an average of 1,500 tons per week. A sum of £24,560 was spent last summer for the chemicals, manganate of soda and sulphuric acid, used in deodorising operations at the outfalls and storm overflows. The council have appointed an expert to undertake experiments to ascertain whether some means can be devised for dealing with sewer emanations, and also to examine and report on the organisms in sewage and sewer air under various conditions, and the effect of antiseptics on them.

At the meeting of the Lambeth vestry on Thursday evening, a letter was received from Mr. Mark Beaufoy, M.P., stating that Lambeth had the opportunity of securing two fine specimens of old Lambeth art. Arundel Castle is being partially rebuilt, and two terracotta figures, 10ft. high, which were modelled in Lambeth (probably by John Bacon) and burned by Coade in 1798, had been bought by Mr. Edgley, who was willing to present them to Lambeth for one of its open spaces. The vestry unanimously agreed to accept the figures, and to place them in the garden on the Albert Embankment, opposite St. Thomas's Hospital, close to where they were originally made. The vestry passed a vote of thanks to Mr. Edgley for his gift, to Mr. Mark Beaufoy, who bears the expense of bringing the statues to Lambeth and of fixing them, and to Mr. J. Francis Bursill, who recognised the figures as Lambeth work, and induced Mr. Edgley to present them to the parish.

The council of the Ontario Association of Architects has had printed and circulated in pamphlet form the by-laws of the association together with a complete register of the members arranged alphabetically and also according to place of residence, and a transcript of the Ontario Architects' Registration Act. Toronto leads off with 73 members, Ottawa following with 19, Hamilton 11, Kingston 7, and London 5, while the members in other towns total 39, making in all a membership of 154. This number includes practically all the architects in the province.

Not much has been heard, for many years, of the excellent scheme for the formation and preservation of a representative national collection of photographic portraits, inaugurated as long ago as 1864 by Mr. James Glaisher, F.R.S., and adopted by the Amateur Photographic Association, of which the Prince of Wales was, and continues, president. Seven-and-twenty years ago, however, the portraits were only carte-de-visite size, and no permanent process being then known, it was not surprising that the two hundred small silver prints then executed and deposited in South Kensington Museum were regarded as so unsatisfactory that the project fell into abeyance. The prosecution of the task has now been resumed under more favourable conditions, and over two hundred large portraits, executed by the permanent-carbon process, are about to be added to the Museum collection. These were on exhibition at a private view on Saturday. The present series have all been taken by Mr. Arthur J. Melhuish, hon. secretary to the association. The photographs are taken for the purposes of this collection only, and not for publication, and previous to its being placed in the Museum, each portrait must be approved by the sitter and by the standing committee. It is obvious that a heavy responsibility rests on the selection council to determine who may be regarded as "eminent representative English men."

The Broadway Cable Road, New York, for street cars is in progress, and is a substitution of cable for horse traction. The extent of the work, its costliness, the traffic in the street, and the obstructions encountered in the shape of pipes and drains, conduits, &c., are noticeable. There are two parallel lines of track. The steel rails are of the grooved girder type, 7in. high, and weigh 91lb. The best rail weighs 67lb. to the yard. At intervals of 4ft. 6in. they are supported on cast-iron flanged yokes, about 5ft. long on top, and 2ft. high, and the cable conduit is formed in the centre of this yoke, and is U-shape in section, formed of $\frac{3}{8}$in. steel plates, bolted to the yokes, to which are also bolted the Z-shaped steel slot rails, which have a slot of $\frac{3}{4}$in. wide. The yokes are bedded in concrete, and the conduit is surrounded by a prism of concrete. A bed of concrete $6\frac{1}{2}$in. thick is laid flush with the top of yokes under the whole street pavement of granite blocks. Particulars and sections of the roadway and yokes are given in the *Engineering Record* of July 25th.

Some interesting details are given of the Opera House, St. Paul, Minn., in the *Engineering Record*. The house is 100ft. by 183ft., and from 60ft. to 100ft. high. The outer walls are of granite of three stories, and brick and brown stone above. The internal construction is mainly of steel, concrete, and terracotta. The floor beams and girders are of steel, also the floor joists and Z-bar columns. The floors are of concrete, laid on flat terracotta arches, or on corrugated iron sheets between the floor joists, and covered with matched pine boards. The exposed beam flanges and columns are jacketed with terracotta fireproof sheathing; the partitions are of hollow brick. Curved girders are used in the balcony and gallery, these forming the risers between the seats, an arrangement entirely new, which has proved a very economical construction, and will give a safe load of 150lb. to the square foot. Mr. A. Reed is the architect, and Mr. Olaf Hoff the consulting engineer.

CHIPS.

The commission for the execution of the stained-glass east window in St. Anne's Church, Strathpeffer, to the memory of the late Duchess of Sutherland, has been intrusted to Messrs. Powell Bros., of Park-square, Leeds, whose design was selected in competition with other art firms.

A Primitive Methodist Chapel and School is being erected at Withington, near Manchester. The architect is Mr. Joseph Swarbrick, C.E., of Manchester, whose designs were recently adopted by the trustees.

The son of the late Mr. Edwin Long, R.A., has intimated his intention of making provision for an annual prize, to be given in perpetuity at Bath College, in memory of his father. Mr. Edwin Long was a Bath man, and commenced his education in that city. It is said, however, that he devoted more time to sketching caricatures of his schoolmaster than to his books.

A new Congregational church and Sunday-schools are being built at Haydock at a cost of £9,000. The buildings are in the modern Gothic style, and include a church to accommodate 600 persons, and lecture hall, four class-rooms, infants' room, and library.

Miss "Field Commissioner" Booth visited Sunderland on Sunday, for the purpose of opening a new "citadel" in Lambton-street. The dimensions of the large hall are:—Height, 30ft.; length, 62ft.; breadth, 73ft.; and a room which has been placed at the back, partly under the platform, measures 48ft. by 25ft. A gallery is provided, and the building will seat 1,800 persons. The external doors number eight, and there are four large staircases to the gallery. Mr. W. Gilbee Scott, of London, is the architect, and Mr. F. T. Coxhead, of Leytonstone, the builder.

A letter dated from Boulogne-sur-Mer has been received by the creditors of Councillor Davison, builder, of Birkenhead, who disappeared on the 4th July, stating that his absence is due to ill-health and mental troubles, and that there "ought to be sufficient funds to pay all creditors and leave a provision for his family." He has also written to the town clerk resigning his seat on the corporation.

On Friday evening, at the Lion Hotel, Caerhowel, a supper was given by Colonel Harrison to the men employed upon the works at Caerhowel Hall, which is now undergoing alterations and considerable enlargement, under the direction of Mr. W. H. Spaull, F.R.I.B.A., Oswestry, the contractor being Mr. W. H. Thomas, Salop-road, Oswestry. The chair was taken by Mr. Frank H. Shayler, clerk of the works and assistant architect to Mr. Spaull.

The convalescent home at Seaford, opened last week, has been built from designs by Mr. Ewan Christian. Mr. Shilton, also of London, is the contractor, and the outlay has been £15,000.

As a result of his persistent questioning of the Government on the subject, Mr. Elliott Lees, M.P. for Oldham, has received an intimation that the Government will do their best to persuade the trustees of the National Gallery to make arrangements for a periodical interchange of the pictures lent to provincial art collections.

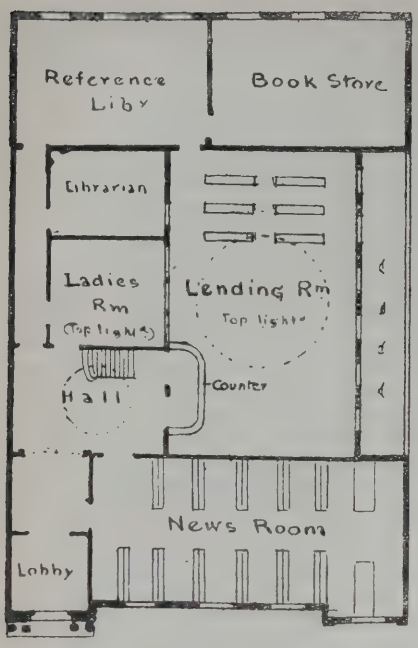
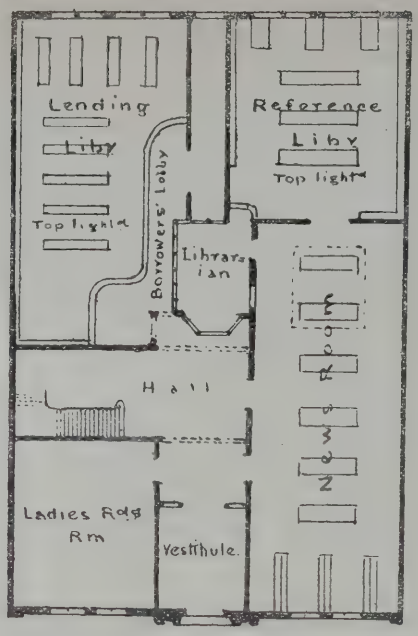
SPECULATIVE ARCHITECTURE.

SPECULATIVE designing, or that kind of architecture which exists only on paper, and which has no other rational ground than that of exhibiting the author's skill as a draughtsman, has its merits and demerits. To a certain extent, competition work may be included in the term; the man who sends in a design for a given building on the chance of winning a premium is a speculative designer, though he may have something more practical in view than the student who prepares a design for a cathedral or a national museum as a competitor for a prize at the Royal Academy, the Institute of British Architects, or a school of art. A public competitor for some building to be actually erected is generally one who knows a little of practical architecture and the requirements of buildings of the kind that he is about to engage in; but not so the student in an art school who sets himself the task of preparing a design for a building that is proposed to a class. The term "academic" architecture would be more strictly applicable to this class of effort, perhaps; at least, there is this distinction between the two sorts of design—in one case the author has to apply his skill to a building that is to be executed, in the latter case no actual building is contemplated, only a design on paper, in which the artistic powers of the author or student are called into exercise. In the one case actual conditions or instructions have to be complied with; in the latter the conditions are imaginary or merely assumed. Consequently a great deal more freedom and artistic imagination is permitted in the academic design than in one which has to follow instructions of a building committee. Except this important difference, the term "speculative" may fairly cover the ground, as both kinds of effort are more or less tentative, matters of conjecture, problematical. The work has the character of an essay. The product of the artist's mind is a paper design, and this definition comprises to a large extent modern architecture, which has no other existence than that of designs on paper.



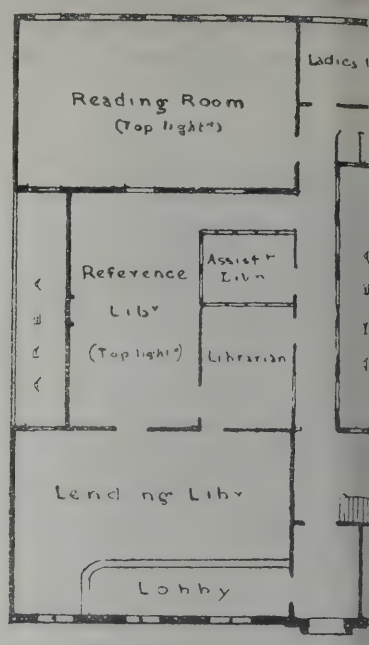
We do not desire to underrate the value of speculative design. Competition, whether for actual buildings or for the purpose of instruction in schools and academies of architecture, has its value. Many of our finest edifices owe their inception to the working out of the artist's ideas on the drawing-board, unhampered by considerations of expense, material, and construction. The practical architect is restricted very much by these things; his pencil is cramped by practical and ever-present conditions; his plan must meet actual requirements, which are often quite incompatible with good or artistic design; his elevations are restricted by considerations of cost and the use of a certain material. But these matters do not weigh on the mind of the speculative designer, whose conception on paper may never be translated into bricks and mortar. The results we see in many of our public competitions, and especially in prize designs of students of the Academy, designs for the Soane Medallion, and those submitted for medals and prizes in the Department of Science and Art—impossible designs for Houses of Parliament, cathedrals, churches, and technical colleges.

One of the characteristic weaknesses of this class of design is that of an utter disregard to cost. The scheme is too ambitious. A hall and vestibule of grandiose proportions, adorned by marble staircase columns and arcades, and surmounted by a dome or a richly-panelled vault, is a feature the youthful aspirant to technical honours is never tired of introducing. It serves to exhibit not only his skill as an artist, but his architectural resources and learning. Stately corridors surrounding courts or quadrangles of almost palatial dignity lead from the hall to the apartments. These are, of course, equally sumptuous and magnificent in their proportions and decoration. Externally the mania for pavilions, domes, cupolas, and turrets is rampant. They are prodigious in size, and vie in splendour with the glories of the Duomo at Florence, St. Peter's at Rome, or the Invalides at Paris. Symmetry of plan and elevation is another characteristic of the speculative designer. If the design be that for a church, the cathedral form is chosen; it is modelled after Canterbury, Lichfield, or St. Paul's; it must have a central tower, spire, or cupola, with western towers. If it be for a domestic or town mansion, the balanced and geometrical plans of Blenheim, Holkham, or Castle Howard are selected. If for a civic or public building, all the resources of architectural composition are embodied, and visions arise of such edifices as Barry's Parliament Houses, the Tuileries, Versailles, or the Escurial. The grand and stately arrangements of these buildings are pressed into service, even although they are unsuitable, and have to be reduced in scale and shorn of much of their magnificence in order to bring them into unison. Scruples as to size or dimension do not enter into the head of the author; peculiarities of site are ignored. There are yet advantages in the study of these designs; they present architecture in the abstract, good classical models are consulted, and the powers and capabilities of the designer are called into exercise.



Disregard of the practical conditions of design are not less strongly shown in materials and construction. The author has taken his model and worked it out with absolutely no reference to material, which may either be stone or costly marble, brick, or terracotta. Not that it matters much: the design will never be executed. The design, if a Classic building, looks as if it were carved out of a solid block; no indications of courses or bond are given in the set of drawings in ink or sepia. From first to last the student has probably never asked himself the question as to the material or how it is to be worked. The sections are marvellously vague; they are ominously silent as to the mode by which the cupola or central lantern is to be carried, as in one of the designs for a cathedral awarded a silver medal in the National Competition; or how headway is to be obtained for a grand staircase to the first floor. As they are generally blacked in, or tinted in one colour, and all intricate construction omitted or shown in solid section, it is often a puzzling matter to find out. But want of constructive detail is made up by artistically-drawn interior elevation and decoration, and the chief object of the section is apparently to show the interior apartments. The French system of drawing sections in isometrical perspective has some indisputable advantages when a pictorial effect of interior arrangements is desired, the sectional parts being blacked in; indeed in this kind of representation we are much behind the French and German draughtsmen. Artistic draughtsmanship is no doubt greatly benefited by this supercilious disregard of constructive detail, which devotes all its ability to the figures of a frieze, while it neglects to show the girders and other constructive expedients necessary to carry a roof or a dome. The academical *regime* confines a man to the external architecture, the style and canons of art; it cultivates the student in the historical sequence and critical exposition of his art; it makes him a good doctrinaire, skilled in tenets and schools, but very unfitted to apply his knowledge to practical everyday wants.

An inclination to exaggerate effects is common enough in designs of this class. Thus a vaulted hall of proportions suitable for a cathedral or a rotunda, and dome of height and size that will almost compare with that of the Capitol at Washington, are met with in designs by novices submitted in competition in the Academy, or for the Department of Art. A domical hall is introduced where a practical architect would have been contented with a vestibule of moderate dimensions, and the columnar ordinance where common sense would have dictated a plainer treatment. Again, the academic *régime* cultivates the letter rather than the spirit of art, and this has been the principal objection urged against the teaching of the Academy of Fine Arts of Paris, where the copying of the antique has taken the place of all independent study, and led to the subordination of the individual. The late M. Viollet le Duc, referring to the teaching at the Ecole des Beaux Arts, says, "It is confined to copying what are commonly called *academies;* that is, nude men always under the same light, in the same place, and in positions which may fairly be described as torture paid by the hour. This course of drawing from nature has now lasted for about 217 years." Much the same may be averred of the academical studies of architecture which our art schools inculcate. Formulas of style, classical ordinances, porticoes, domical compositions are taken as indispensable recipes for making architecture.



Competitions for public buildings have fostered speculative designing. Many men whose practical experience of building is small can devote much time to the preparation of designs for town halls and municipal edifices, and can thus display their abilities on paper. The competition for the South Kensington Museum completion was a good opportunity for the exercise of ambitious or "high flown" architecture; the requirements were of a kind to develop into imposing features; the programme of plan consisted of great courts and galleries devoted to Oriental and European exhibits, without any of those small and tedious divisions of plan which are required in more everyday buildings. It was easy, for example, to introduce large domical halls and courts surrounded by colonnades or arcades in the form of loggie. A central dome or tower naturally suggested itself over the entrance hall, and pavilions of ambitious design over the intersections of plan, and at the main angles. The superimposed arcade or loggia round the courts is a feature which admits of great effects, and the models of the Italian cortile, the Borghese, and the courtyards of many Spanish palaces lend themselves to the imagination. Incentives to adopt Classical features are not wanting in preparing designs of this sort. In the Museum competition the authors have availed themselves of the columnar treatment found in the Renaissance of Italy and the Spanish Peninsula, and the picturesque architecture of Granada and Seville. Palladian and Moorish features have been called into requisition, together with that playful kind of hybrid which goes under the name of Churriqueresque—a sort of Louis Quinze style, suitable only for the silversmith or furniture designer. The architectural designs for which prizes are awarded in the Department of Science and Art are even more prodigal and profuse. Cathedral churches, public and classic halls, science and art museums, law courts, and town mansions are the kind of subjects which the authorities have set before students. The result, as we have shown, is not favourable to pupils who are studying architecture as a profession. All sorts of

PLAN A

PLAN B

PLAN C

extravagant notions are encouraged, and as draughtsmanship is mainly regarded by the examiners, the more elaborate designs stand the better chance of a reward. As we have observed, speculative or academical design is of advantage as a means of education in style; but it has the objection of fostering costly and unpractical schemes, and often a kind of draughtsmanship detrimental to real art.

FREE PUBLIC LIBRARIES.—XV.

PLANS OF OBLONG SHAPE.

AS examples of libraries planned for plots of rectangular shape having a depth of about double the frontage, we give sketch plans of three designs recently submitted in competition for the Public Library of St. George, Hanover-square. In this instance streets on both frontages exist, and the dimensions of the site were 80ft. frontage and 120ft. depth from street to street. On both sides there are buildings which preclude the possibility of obtaining light by windows on either side. The requirements were, on the ground floor an entrance, newsroom of about 2,000 square feet, a lending library of about the same area, a reference library of half that area, besides a ladies' room and necessary conveniences; above, a museum, committee-room, librarian's room; and in the basement, stores, caretaker's room, &c. The problem is one that is often likely to be solved in towns, where large open sites are not readily obtained, and therefore we have thought it useful to refer to plans of this description.

TWO METHODS POSSIBLE.

As the area available was not more than sufficient for the accommodation required, it was obvious that some economy had to be exercised. There were two possible courses open to the architect: one was to provide areas for light, and the other course to occupy the whole area and provide top lights to some of the rooms, as the frontages only permitted windows of a limited size and height. The requirements of the museum and librarian's rooms restricted the area for top-lighting, as these had to be provided on the upper floor. Those who sent in designs have shown both principles. The plans with light areas indicate one mode of accomplishing the object; but an area to be of any practical good must be of sufficient area to allow rays of sunlight to take an angle of 45°, or thereabouts; any narrower limit would not be of much service. But in a limited plot in a street it is not easy to obtain areas of sufficient size. One mode may be used in this case with advantage in a site which admits of lateral light, and that is to have a side area adjoining the premises on one or both sides, provided, of course, that the buildings adjacent are not too lofty and no obstruction is offered.

SIDE AREAS

have been arranged in plans A and C. In plan A the area is provided to assist in lighting the lending library. The windows are placed above the bookshelves of the room, which is also lighted by a circular lantern over the centre. If the adjoining houses are not lofty, and the windows are inserted near the ceiling, it is not difficult to admit sufficient light. In plan C an area is shown on both sides, one of them lighting a corridor, entrance hall, &c., with borrowed lights in the walls of librarian's and assistant's offices, and the other the reference library, lending library, and newsroom. All the latter departments have top lights in addition. When a right of light is not obtainable, it would be necessary to make these lateral areas of sufficient width to insure a not too perpendicular angle of light over the adjoining premises. The question is one for arrangement. The legal point of easement of light has to be considered before the windows are introduced in side walls. There are advantages in having side areas, if they can be rendered of value for lighting; they allow of cross ventilation, allow the roofs to be more independent of adjacent property, and in other respects they are useful.

TOP-LIGHT.

When side areas are not available, owing to the difficulties we have pointed out or through want of width, top lighting must be resorted to, though, of course, this principle is limited by the necessity of having a second story over a portion of the site. The provision of a museum over the front portion of the site—a very questionable addition to a town or suburban library—curtails the space for skylights or lanterns over the ground-story rooms. In plan A the museum and committee-room occupy the front over the newsroom, an area of 1,800ft. being appropriated to that purpose in some plans; while over the reference library in the rear we get a librarian's room and book-store. Between these double-storied portions is t flat over the hall, lending library, and ladi room, with lanterns for light. Plan C sho the lending library only partially covered the museum. The back wall of museum carried on a girder, and a narrow skylight obtained outside, which lights the lendi library on the inner side. The rest of t plan is uncovered, and therefore is availa for lantern lights.

Plan B, which has been selected, exhib a fully-occupied area, the departme covering the whole space between the pa walls and the rooms are mainly lighted skylights in the rear of the museum, whi occupies the first story in front. T museum back wall runs across the ne room near the inner end; hence there i space of flat which has been utilised fo skylight at this end. The front windo admit light to the front portion of this roo Lanterns are provided over the lending a reference libraries, and the librarian's off is also top-lighted. The librarian's acco modation is on the second floor.

ENTRANCES AND LOBBIES.

The three plans illustrate also three diffe ent modes of entrance. The side entrance h the advantage of allowing one of the rooms be placed lengthwise to the main front. plan A the newsroom occupies this positio As this is the principally frequented roo it ought to be near the entrance, so as prevent confusion and allow of easy ingre and exit. The hall and borrowers' lob are next in importance, and therefore t lending library is suitably located in t centre. In plan C the entrance is on t opposite side, and the author has placed t lending library and borrowers' lobby ne the principal doorway. Much confusion a possibility of collision are secured by t arrangement. The borrowers' departme is in great requisition, and therefore should be seen, if possible, on entering t library, so that those borrowing books exchanging them may be able to enter a pass out of the building as quickly as po sible. The newsroom would be better whe the reference library is, unless an ind pendent entrance was made from the stre in the rear. Plan B shows a central e trance; the newsroom is conveniently enter from one side of hall, but the borrowe lobby is rather out of the way, and borrowe would have to pass by the newsroom a ladies' room in order to reach it. But

entre entrance to a building of limited width necessitates placing the main rooms—such as the newsroom—with their long axes at right angles to the front, one on each side of the entrance corridor, and therefore of lighting them by end windows only supplemented by top-lights, unless side areas are provided.

SUPERVISION.

A very desirable provision is that the librarian's office should have as central a position as possible, to enable the librarian or his assistants to have a command over the departments and entrance. Plan B adopts a good position for the office, and plan C shows the offices overlooking the reference library and the corridor from newsroom. The office should, if possible, be placed to overlook the entrance hall as well as the newsroom and reference library; but in many public libraries the office is placed in some out-of-the-way part, and at a distance from the newsroom.

GLAZED ROOFS.

We have given sections of lanterns or raised skylights, to which we refer the reader for further information on this point. Sometimes, however, it may be desirable to glaze the centre roof or ceiling from wall to wall. When a long room has only a few end windows and a portion of it in the rear can be lighted above, the utmost advantage can be taken if the roof is constructed with hips to form a low pyramid over the part of room so lighted. These hips can be made of substantial size and moulded, and the bars of lights also moulded and decoratively painted below, the whole forming a large lantern of the whole area of that part of the room top-lighted. The flat ceiling can be made to finish against a cross beam carried in trusses on pilasters, or be divided into compartments or panels. In this manner a long room can be partly lighted by windows at one end and partly by top-lights.

THE CONGRESS OF HYGIENE.

DURING the present week the seventh international congress of hygiene and demography is being held in London, this being its first assembly in this country. It is being largely attended by foreign, Indian, and colonial delegates, and the interest of the many gatherings simultaneously held in the ten sections is well sustained. The meetings take place in the buildings of London University and other rooms at Burlington House, and at the Geological Museum in Jermyn-street. An exhibition of sanitary appliances and a bacteriological museum are among the special features of the Congress.

The opening meeting was held on Monday, when the Prince of Wales, as president, delivered the inaugural address. He remarked that of late years much attention has been paid to the dangers to health, especially in large towns, and much had been done to avert them. The good already accomplished should encourage them not to be content, until prosperity in business, and all other things desirable for the national welfare, were made consistent with national good health. They would also have to consider the conditions under which the greatest working power of men could be maintained. Eulogies of Dr. E. A. Parkes, Dr. de Chaumont, and other deceased Englishmen who had led the way in hygienic reforms were delivered by Dr. Bronardee, of Paris, Prof. von Coler, of Berlin, Prof. Corradi, of Pavia, and M. Körosi, of Buda-Pesth, and Dr. Roth, of Saxony, as representing the foreign delegates. In the evening a conversazione was held at the Royal College of Surgeons.

ARCHITECTURE IN RELATION TO HYGIENE.

The section probably of most interest to our readers was Section VI., dealing with "Architecture in Relation to Hygiene," of which Sir Arthur W. Blomfield, A.R.A., is the president and Mr. Ernest Turner, F.R.I.B.A., the secretary. In his presidential address, delivered on Tuesday, Sir A. Blomfield said the difficulty of deciding what was the relation of architecture to hygiene lay in the uncertainty as to the strict limits for the practice and duties of the architect. If the late James Fergusson's views were accepted, that architecture was the art of ornamental and ornamented architecture, most of the papers proposed to be read and discussed in that room would have to be addressed to some more purely scientific section. If they accepted the more usual definition of architecture as the art and science of building, its relation to hygiene at once became too varied and complex to admit of clear or concise description. He threw out the suggestion that at a future congress an instructive paper might be written dealing exclusively with the points of contact between hygiene and the purely æsthetic side of architecture, a branch of the subject thus far practically untouched. But if education and culture continued to advance as they had done in the last fifty years, and habits of intelligent observation were fostered and encouraged, the eyes of the masses would every day become more sensitive and fastidious; the dreary and monotonous streets, and badly-designed buildings which at present passed unnoticed, would begin to exercise a depressing and disturbing influence on the mind, which could not fail to have some ill-effect on the health, comfort, and general well-being of the community. It was now a recognised fact that certain colours, quite apart from the nature of the pigments or dyes which yielded them, produced very decided effects, both on the mind and body when in certain conditions, and it was probable that the same was true of certain combinations of colours and even of form in which the skill and taste of the artist must be paramount, and in which the aid of science, however necessary, could only be looked upon as subsidiary. Dr. B. W. Richardson, in a lecture given some years ago, dealt with this subject in a systematic manner, and the President would like to see the same topic treated by an architect from an artist's point of view.

A vote of thanks was passed to Sir A. Blomfield, on the motion of Professor Ferger, of Copenhagen, who eulogised the work of English architects, seconded by M. Charles Lucas, of Paris.

OPEN SPACES.

In a paper on "Open Spaces," written by Mrs. Basil Holmes, and read by Earl Meath, it was shown that the provision of the healthy areas needed to insure the health of the people could be best secured by a systematic acquisition and preservation of land for public recreation in connection with the towns and in relation to their growth, and increased facilities for taking people from the towns into the country. Public recreation-grounds should be provided in each parish in proportion to the number of inhabitants, and there should be a fixed minimum of open space for a certain number of the population.

HYGIENIC PRINCIPLES FOR THE EXTENSION AND INTERNAL IMPROVEMENT OF TOWNS.

A communication on this subject was read by Herr F. Stübben, city architect of Cologne, who urged that the extension, and also the internal improvement of a town ought not to be left to private voluntary means, but should be ruled and governed by official laws of the district and State. He held that there should be demanded sufficient width of streets, public planted pleasure grounds, cleanliness of sub-soil water and air, arrangement of definite building blocks in suitable sizes, and good sanitary, plumbing, and disposition of buildings, workplaces, and dwellings. To gain these points the district or State should prepare and enforce a printed plan for the extension of the town, with reference to those buildings already commenced, those in the suburbs, and those to be built in the next twenty years. There should be a careful arrangement of streets and plantations, public lavatories, protection against floods, water supply, lighting, and means of communication, to be carried out by the municipality if private enterprise was not sufficient, in order to make sure of a constant extension of building land suitable and ready to be built upon, and thus to prevent any encroachments on the existing space. He also suggested an exchange of land so as to formulate these improvements, and proceeded to lay down a code of building by-laws which ought to be strictly enforced.

THE CONTROL OF THE CONSTRUCTION OF DWELLING-HOUSES.

Mr. Thomas Blashill, superintending architect to the London County Council, in a paper on this subject, sketched the chief structural conditions of a habitable building which are recognised as being necessary for its healthy occupation, including the drainage of the subsoil and exclusion of its air from the dwelling; the use of good materials for building; ventilation and lighting, and the removal of refuse. He proceeded to explain the building regulations now in force in London, and applicable to each of these structural conditions. In many respects Mr. Blashill showed the Metropolitan Acts are very defective; thus they made no provision for the drainage of a naturally damp site, the 6in. layer of concrete required on most sites was of little practical utility, and the exception of sites of "gravel, sand, or natural virgin soil" was very unfortunate. Again, the Metropolitan By-laws were silent as to ventilation under the the wooden floors of the lowest story; but he had long been convinced that there ought to be no wooden floors of the ordinary construction in the lowest story of a house, and no space, ventilated or unventilated. The air-inlets were invariably stopped up to prevent cold and draughts, and, at the best, the space must be a means of introducing stagnant or ground air into a house. If brick or stone paving would be too cold, floor-boards 1¼in. thick, Burnettised or Kyanised, might be nailed to narrow fillets embedded in the concrete about 3ft. apart, or they might be nailed to a layer of coke breeze and cement concrete, or the ordinary wood flooring blocks might be used. Thus the cost of excavation and of floor timbers would be saved, and a solid impervious floor obtained. The burnt bricks and bad mortar permitted the passage of moisture through walls. Mortar and plaster mixed with putrid or earthy matter increased this mischief and polluted the air. The London County Council General Powers Act, 1890, gave power to the Council to regulate the composition of plaster, which hitherto could be made chiefly of foul road scrapings or garden mould. The materials demanded would be generally similar to those required for mortar. The provision of a damp-course near the base of a wall was most important; but under the Metropolitan By-laws there was in external walls no provision against the passage of damp at the level of the ground or below that level. The Model By-laws of the Local Government Board suggested that the cavity should extend to 6in. above the surface of the ground, and even that was hardly enough to provide against the splashing of rain. It would not be very unreasonable to demand that the whole of the lowest part of the wall, up to a height of 12in. above the ground, should be built of hard bricks bedded in cement mortar. There did not appear to be any legal authority at present for demanding a dry area, or even an external coating for the protection of the lower part of a wall, these matters not forming part of the "wall." The provision of open space secured by the Metropolitan Amendment Building Act of 1882 was marred by the fact that it was permitted to cover the whole of the open area with buildings not higher than the ceiling of the ground-floor story of the main structure, and in many cases this by-law was very inadequate. The Model By-laws fixed the size of the open space as a minimum of 150sq.ft., but increased the area in proportion to the height and length of the house. These by-laws also enforced open spaces in front of dwelling-houses, and a similar result was obtained by the Metropolitan Regulations, which fixed the widths of streets and the heights of buildings. These Model By-laws also demanded that every room should have a window measuring one-tenth of the area of the floor, and one-half of it should open so that the opening extended to the top; this window must overlook an open space. The building regulations adopted by the London County Council for artisans' dwellings that were built upon the land which it had to devote to that purpose, indicated the views of that body as to the proper sizes of dwelling-rooms for the lowest class of the population that inhabited separate tenements. The assumption was that the average population would be two persons per room, and the standard height of rooms was to be 9ft. A one-roomed dwelling was not to be of a less area than 144sq.ft.; in a two-roomed dwelling the additional room was to measure at least 96ft. square; and in a three-roomed dwelling the third floor was also to be of this size. Basement rooms were not to be sunk more than 3ft. below the adjoining pavement, and waterclosets were not to be immediately accessible from dwelling-rooms. The closets were, in those dwellings, generally so arranged

with regard to the scullery that a current of air would pass to the other rooms through the scullery, and not through the closet. The Model By-laws provided that the closet should adjoin an external wall, and should have a window measuring 2ft by 1ft., also a ventilating air-brick or air-shaft; but no regulations would secure these contrivances from being stopped up by the occupiers. It was, he held, a source of evil to assume that a watercloset must be a foul place, and to trust to remedial precautions which, in practice, would never be taken. A closet should, by its construction, be rendered so free from impure air, that nothing beyond a window should be necessary to keep it sweet. There were in the metropolis no very precise regulations for getting liquid refuse into the drain; but by-laws were now, the author intimated, under consideration. The Model By-laws required that the soil-pipe from a closet or slop-sink should be fixed outside a house, and shall be thoroughly ventilated. The waste-pipe from a bath, lavatory, or ordinary sink must discharge outside the building over a channel leading to a trapped gully 18in. distant. But there was no provision for a trap under the sink, which was necessary, and there was no satisfactory provision for the trap which forms part of the closet apparatus. An earth-closet had to be lighted and ventilated, as in the case of a watercloset; but he thought no earth-closet should be permitted within a building, though with proper arrangements it might be placed close to a building. In conclusion, Mr. Blashill said the structural conditions of a healthy house do not appear to be numerous, but they are exceedingly difficult to define, so that they can be clearly understood and enforced by law. It ought not to be possible to build a house in which the conditions necessary to healthy occupation are violated. Indeed, this can be prevented where the model by-laws are in operation, which forbid the occupation of a house until it has been certified to be fit for human occupation. But if this care is necessary in a new house, its necessity can hardly be disputed in the case of old houses, where the conditions are notoriously unsatisfactory. It has been proposed to bring these houses gradually under inspection by fixing a period after which the public authority will be authorised to inspect and order the amendment of defects. This is a matter which, both as to regulations and as to inspection, will demand the greatest care and caution. If it is established, it should apply to all houses without distinction of size or of the class of their occupiers, so that the whole population, the interest of which, as regards health, is common and cannot be divided, should be protected by public law from evils over which individuals can have but little control.

HYGIENE OF GROUPS OF DWELLINGS AT LOW RENTALS.

M. Charles Lucas, architect, of Paris, observed that while the effort to unite habitations of various classes, such as houses in flats and small houses for not more than one or two families each, demanded a special study of the hygienic conditions under which they could be grouped together; the architect ought not to overlook the possibility of giving a certain picturesque charm to the whole group, and should also take into account every means of realising the economy of construction to be obtained from combination of such dwellings into one group. He regarded it as desirable that local industrial quarters should have some public buildings reserved for the inhabitants of the quarters thus created, making the assemblage of houses at low rentals a special quarter of a town.

THE HEATING OF TOWNS BY STEAM FROM CENTRAL STATIONS.

Mr. S. M. Burroughs pointed out the advantages of substituting for the usual fireplaces and gratings a steam heating apparatus, the steam to be supplied from central stations—a plan that had already been tried successfully in the United States. He summarised its advantages as (1) The smoke annoyance could be entirely abolished, as smoke-consuming appliances could be employed in the large furnaces at the central stations; (2) An economy of heat could be secured; the steam pipes could be placed underground, covered with a non-conducting substance; (3) Danger of fire was considerably decreased; (4) Dust and dirt from fireplaces and stoves could be entirely avoided; (5) A great economy of labour secured; (6) The temperature could be more easily regulated than by the usual methods.

THE EDUCATION OF PLUMBERS.

A special meeting was held on Tuesday afternoon for discussion on the education and registration of plumbers in relation to public health. Sir Douglas Galton took the chair. The attendance included representatives from Birmingham, Bradford, Brighton, Bristol, Cardiff, Hull, Leeds, Leicester, Lincoln, Liverpool, Manchester, Newcastle, Nottingham, Plymouth, Sheffield, Southampton, Swansea, Aberdeen, Dumfries, Dundee, Edinburgh, Glasgow, Inverness, Belfast, Cork, and Dublin. The Master of the Company of Plumbers announced that a Bill had been prepared for presentation next Session, for the purpose of creating a general representative council which should be invested with the necessary powers to determine the qualification and regulate the practice of those plumbers who were registered, in order that the public might distinguish as to responsible men. The Lord Provost of Edinburgh then proposed a resolution in favour of an efficient system of registration as essential to the protection and preservation of health. After discussion the motion was adopted.

Professor Emile Trélat, of Paris, gave, on Wednesday, an address on

THE HYGIENIC COMPOSITION OF WALLS OF DWELLINGS.

He made a critical examination of the composition of exterior walls, with special reference to the tendency of usual practice in this matter. The hygienic function of the walls of dwellings was defined as a complex one, and one which should tend simultaneously to produce the following results: (1) The walls should protect the interior from the variations of the external atmosphere; (2) they should be impenetrable to infectious influences arising from the vital functions of the occupants. In order to obtain perfect isolation of the interior of a house, it would be necessary for the wall to be such that the time needed for the transmission of heat from one face of the wall to the other should be long enough to prevent the external temperature, with all its variations, ever being able to modify that constancy of temperature which hygiene required on the interior face. Although a movement backwards and forwards was produced under the influence of the incessant variations of the external atmosphere in the matter composing the wall, it ought never to reach its interior face. A wall of this nature would need a capacity of isolation varying according to the latitude. Our modern constructions were subjected to economic conditions, which had more and more reduced the thickness of walls in dwellings, and their capacity of isolation had become very small. This was a disadvantage the importance of which ought to be realised, and which the hygienic comfort of habitations required that we should remedy. Another point to be considered was that all emanations of indoor life were causes of infection in the inclosing walls. Walls threatened to become receptacles of infection when they had contained for a long period the gases and effluvia which emanated from our bodies. The materials of which walls were constituted were more or less liable to be impregnated with and to retain these effluvia. A second problem to be solved was: Were we to choose materials for the construction of the walls of dwellings which were easily penetrable by gases, or should we, on the contrary, give the preference to impenetrable materials?

PILE FOUNDATIONS IN MARSHY LANDS.

Mr. P. J. H. Cuyper, of Amsterdam, gave a short description, on Wednesday, of the mode houses are built on piles in the marshy grounds of Holland and Friesland, and showed that most care has to be taken that every part of the pile shall be continually below the water level to insure stability. The hygienic conditions for basements and cellars built on a wooden foundation were that the foundation of the walls must be laid underneath the water level, the floor or pavement must be above the highest water level. In case the floor was situated lower than the water level, the pavement and walls should be waterproof in construction. A quite different method of constructing cellars was used when they were made independent of the surrounding walls, and built by masonry in a floating basin.

THE SANITATION OF THEATRES.

Dr. Lennox Browne read a paper on this topic, illustrated by a dozen diagrams prepared and explained by Mr. Ernest Turner, F.R.I.B.A. secretary to this section, showing the actu conditions found in some of the theatres in spected. The authors pointed out that whi much attention was now bestowed on the pr tection of theatre audiences, many gra structural defects were still to be found in th sanitary arrangements, both in the auditoriu and behind the scenes. The isolation of a theat from adjoining buildings was disregarded, an also the proper ventilation of rooms, the mutu protection of both the theatres and the contiguou tenements in case of fire. The disadvantag arising from a theatre being built below the lev of the street, with especial reference to ventilatio and drainage, were dwelt upon. The dressin rooms were often quite inadequate and fault alike in situation, in air space, in ventilation, the number of windows, and in water suppl Water-closets and urinals were frequently place in improper situations, bad forms were used, an sometimes the workmanship was at fault. The were often ventilated into dressing-room refreshment-rooms, lobbies, staircases, and eve on to the stage. Ventilation was frequent unprovided for in rooms behind the scene Even with the best forms of ventilation, th source from which the "fresh" air was obtain was often impure. Dr. Browne gave the resul of visits of inspectors paid to twenty Londo theatres, many of them quite new, and all which contained structural defects in sanitatio He suggested that the authorities should recog nise the necessity for framing regulations f the sanitary arrangements of theatres and mus halls, and should make their periodic inspectio to this end of no less importance than that of th prevention of fire.

FOUR-INCH DRAINS *v.* SIX-INCH DRAINS.

Mr. G. M. Lawford, Assoc.M.Inst.C.E., in paper on this subject, said it was a matter everyday occurrence to find a 6in. pipe used f the drainage of a single house, and this size w usually made compulsory by sanitary authoritie whether metropolitan, urban, or rural. As house drain was frequently dry for several hou at a time, it was obvious that where pipes of th diameter were used there must be a considera extent of surface on which sediment was d posited, and during the periods of minimum flo this deposit would decompose and foul gases wou be generated. If the house drain was proper disconnected from the main sewer, and efficient ventilated, a large proportion of these ga would be liberated in the atmosphere, but th tendency of the remainder would move in th direction of the house by reason of the absorpti influence of the warmer air within. This gener tion of gases in the house drain, apart from being adverse to the principles of sanitation, w preventible, the remedy lying in the use smaller pipes. Taking as an example the case an ordinary-sized town house, with an average ten inhabitants, 25 gallons per hour would be t maximum flow to be provided for. To th amount should be added the rainfall from th roof and areas. Allowing for 1¼in. of rainf per hour (thus providing for the heavi thunderstorms), the total volume of rainf to be dealt with would be 3,900 gallons p hour. The maximum hourly discharge of se age and rainfall combined would therefore 3,925 gallons, or 65·4 gallons per minu and a 4in. pipe would discharge this amou when running full at the very flat gradient 1 in 207·36, the velocity produced being 2·02 per second, which was barely sufficient to ma a drain self-cleansing. As such a flow was ot likely to occur during an exceptionally sev thunderstorm, without special arrangements flushing, even a 4in. drain could scarcely be ma absolutely self-cleansing, more particularly the usual gradient was from 1 in 40 to 1 in with a consequent increase of discharging cap city. Under ordinary circumstances, therefo a 4in. drain was ample for an average si house, and a 6in. drain was too large to be k free from deposit, more particularly as majority of the pipes discharging into it w 3in. or less in diameter. Baths, lavatories, a sinks never had waste-pipes exceeding 2 internal diameter, and it was the exception find more than one appliance being discharged a time. The question, therefore, naturally ar "How could a 2in. pipe possibly flush and clea a pipe nine times its own sectional area?" Th soil-pipe was the only pipe of larger size wh ever discharged at full bore, and the amount d

rged at one time (two or three gallons at the it) was insufficient to make a 4in. horizontal in run even half-full for more than a few feet. omatic flushing was of the greatest assistance eeping a drain free from deposit, and should dopted in all cases where possible, and more ticularly in cases where, from the depth of the n sewer, the inclination of the house-drain eeded 1 in 60. A tank containing not less than gallons was sufficient to cleanse a 4in. drain by ns of a 2in. siphon and flushing-pipe, and it uld be placed at the extreme end or head of drain, at least 6ft. above the latter point. using a 4in. drain laid at a uniform inclina- not exceeding 1 in 60, aided by automatic hing, all refuse and other matters discharged it could be removed in the shortest time and h the minimum of deposit. The removal of tructions could be provided for by making ry length of drain accessible from inspection mbers. Another argument in favour of the pipe was the increased circulation of air in drain, as by diminishing the sectional area the passage, the velocity of the air current considerably accelerated; the volume of air ch had to be set in motion in order to produce ulation in a 6in. pipe being more than double 24 times) the volume in a 4in. pipe. Gases erated in a 4in. drain would certainly be ried away more quickly than in a 6in. drain, rt from the fact previously stated that the ibility of the creation of such gases in a 4in. n is reduced to a minimum, while in a 6in. n their existence is an absolute certainty. marising his points, Mr. Lawford said the ction to a 6in. drain was the fact that deposits t be formed from which noxious gases were erated, with the probability of contaminating air in the house, while the advantages of a drain were:—(1) Deposit was reduced to a imum; (2) its size was ample for the dis- rge of the greatest amount of waste and rain- er that could possibly pass into it; (3) when bined with automatic flushing at regular rvals, absolute cleansing was obtained; and the increased strength of the air currents and consequential more effectual and rapid ification of the drain.

COMMON LODGING-HOUSES.

Mr. Percival Gordon Smith, F.R.I.B.A., itect to the Local Government Board, in aper read yesterday (Thursday), explained t the term did not apply to the model sans' dwellings, nor to seamen's homes pro- ed under the Fishing Boats Act of 1883, nor ight refuges. Its definition depended largely the circumstances of occupation. Since 1875 mon lodging-houses in the provinces were ervised and controlled under the provisions the Public Health Act; but in London the ice still controlled these establishments. The unt of wall space per lodger (300ft.) was less England than was demanded in corresponding ses in Berlin or Paris; but he did not advo- e an increase. The memoranda issued by the al Government Board for the guidance of vincial sanitary authorities were explained.

TAGE HOMES FOR THE INDUSTRIAL CLASSES IN THE METROPOLIS.

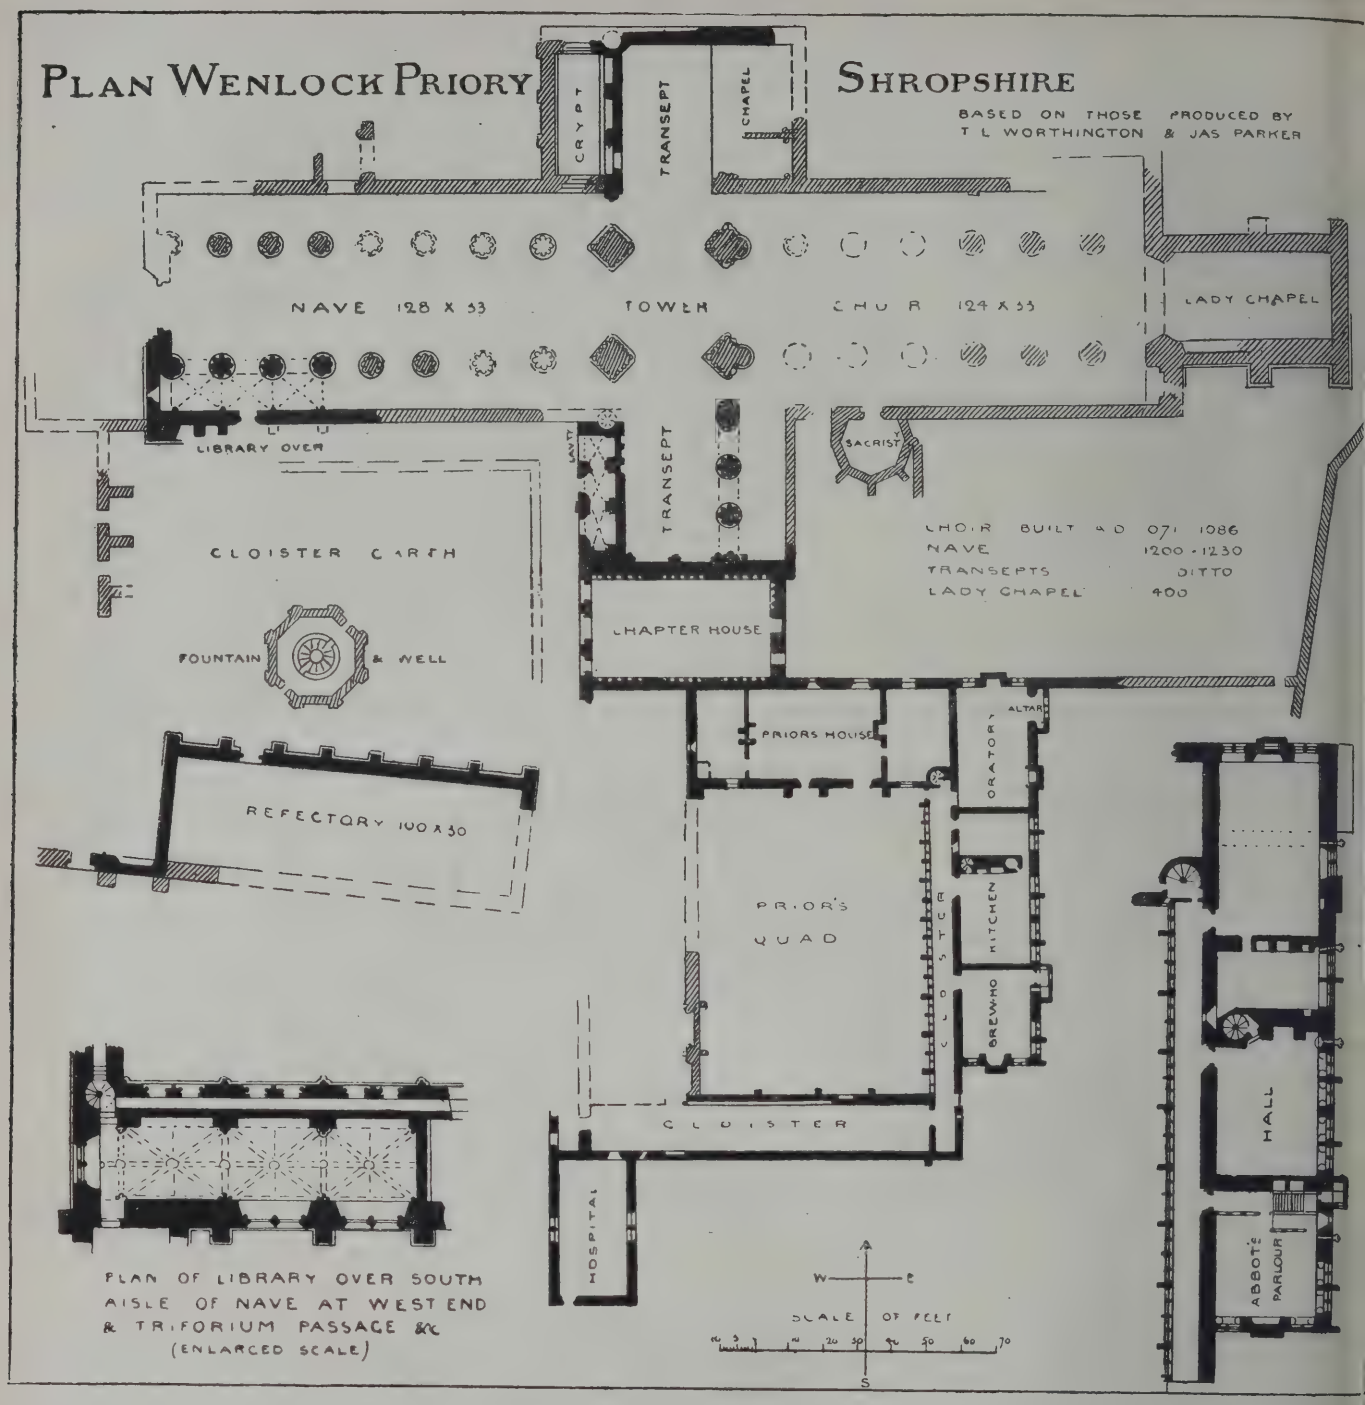
Mr. Rowland Plumbe, F.R.I.B.A., architect the Artisans' Dwellings Company, in a paper this subject, urged that efforts should be le to prevent concentration of industrial homes the central crowded districts of the metro- is, and to induce the industrial classes to live, ere possible, in cottages in the suburbs. He ngly advocated the mixing of classes, as far possible, in new districts, and described the l village for industrial classes, giving sug- tions as to its development and manage- nt. The site should be laid out with e and well-made roads and footways, ich should be planted with trees, and made as ractive as possible. The drainage and sanitary angements should, of course, be perfect; each ne should be self-contained, and should be ght, cheerful, well arranged, commodious, and lthy, the houses well set back from the public tway, with gardens in front and a good drying und in the rear, which could also be laid out an additional garden or recreation ground. e houses should be varied in plan and accom- dation to suit the habits of all the classes, and the different-sized families likely to occupy m. They should be substantially built, and ry sanitary requirement should be provided. ey should be decorated and finished in a pleasing manner to suit the best taste of the occupants, and a general air of comfort, bright- ness, cleanliness, and cheerfulness should be given to them, as also to the estate generally. Open spaces for recreation and for garden allot- ments should be provided. Pressure should be brought to bear upon the local authorities so that the provisions of the Education Act, the Baths and Wash Houses Act, the Public Libraries Act, and all other beneficial legislation of a like character should be carried out, and suitable buildings for the same should be provided. Churches, parish rooms, public board schools, polytechnic institutes, coffee taverns, and clubs of all kinds should also be provided; a sufficient provision of shops should likewise be built in suitable positions, and the question of public- house accommodation should also be most care- fully considered, and (if provided) not placed in positions likely to create discomfort and dis- order. The classes of people inhabiting such estates should pay weekly rents, at least one week in advance. The inhabitants should be encouraged to invest small amounts in the capital of the company. Houses should not be sold to individuals, as in that case abuses at once sprang up; but the whole estate should be owned and managed by one company, the tenants being shareholders wherever possible. The inhabitants should be encouraged to take an interest in the maintenance of the company's property, and forms should be provided on which should be stated any want of repair or other matter re- quiring attention; these should be left at the estate office, and a staff should be appointed to attend to the same. The company should main- tain and manage a proper staff of officials and workmen to attend to all matters of repair and maintenance. It should be established on a proper business footing, and financially it should be so managed as to pay a remunerative rate of interest—say 5 per cent.—to its investors. Mr. Plumbe proceeded to describe, with the aid of plans and designs, Noel Park, a village which has been laid out under his superintendence and from his designs. He mentioned that over 1,300 houses had been built (out of 2,500 proposed) on the estate of 100 acres, which had, for the past half-year, a death rate of 14·41 per 1,000. An average of 25 houses per acre were built upon the estate, including space for roads, and the population was the rate of about seven people per house, so that when it is completed it will contain a population of about 17,500. There will then be over five miles of roads and streets formed. The outlay, including the land, up to the present time has been about £460,000, and the net income is now about £21,000, so that the estate (though only about half-developed) already pays over 4½ per cent.

ENGINEERING AND HYGIENE.

The section devoted to engineering in relation to hygiene met on Tuesday under the presidency of Sir John Coode, who alluded to the progress of sanitary legislation. Whilst admitting that great benefits had accrued from the extensive drainage works which had been executed, and the large expenditure that had been incurred for improving the health of London, it could not yet be said that all had been accomplished which might be done in this direction. Nor would it be possible to say as much as long as the sewage of the metropolis was allowed to flow into any part of the Thames without previous purification by the most perfect method as yet known—i.e., by being filtered through land. The only alternative would seem to be the conveyance of the sewage to the sea coast beyond the mouth of the estuary of the Thames. Nevertheless, and not- withstanding the room which existed for further improvement in the disposal of its sewage, the reduction which had been brought about in the death-rate of London in modern times was as noteworthy as it was satisfactory.

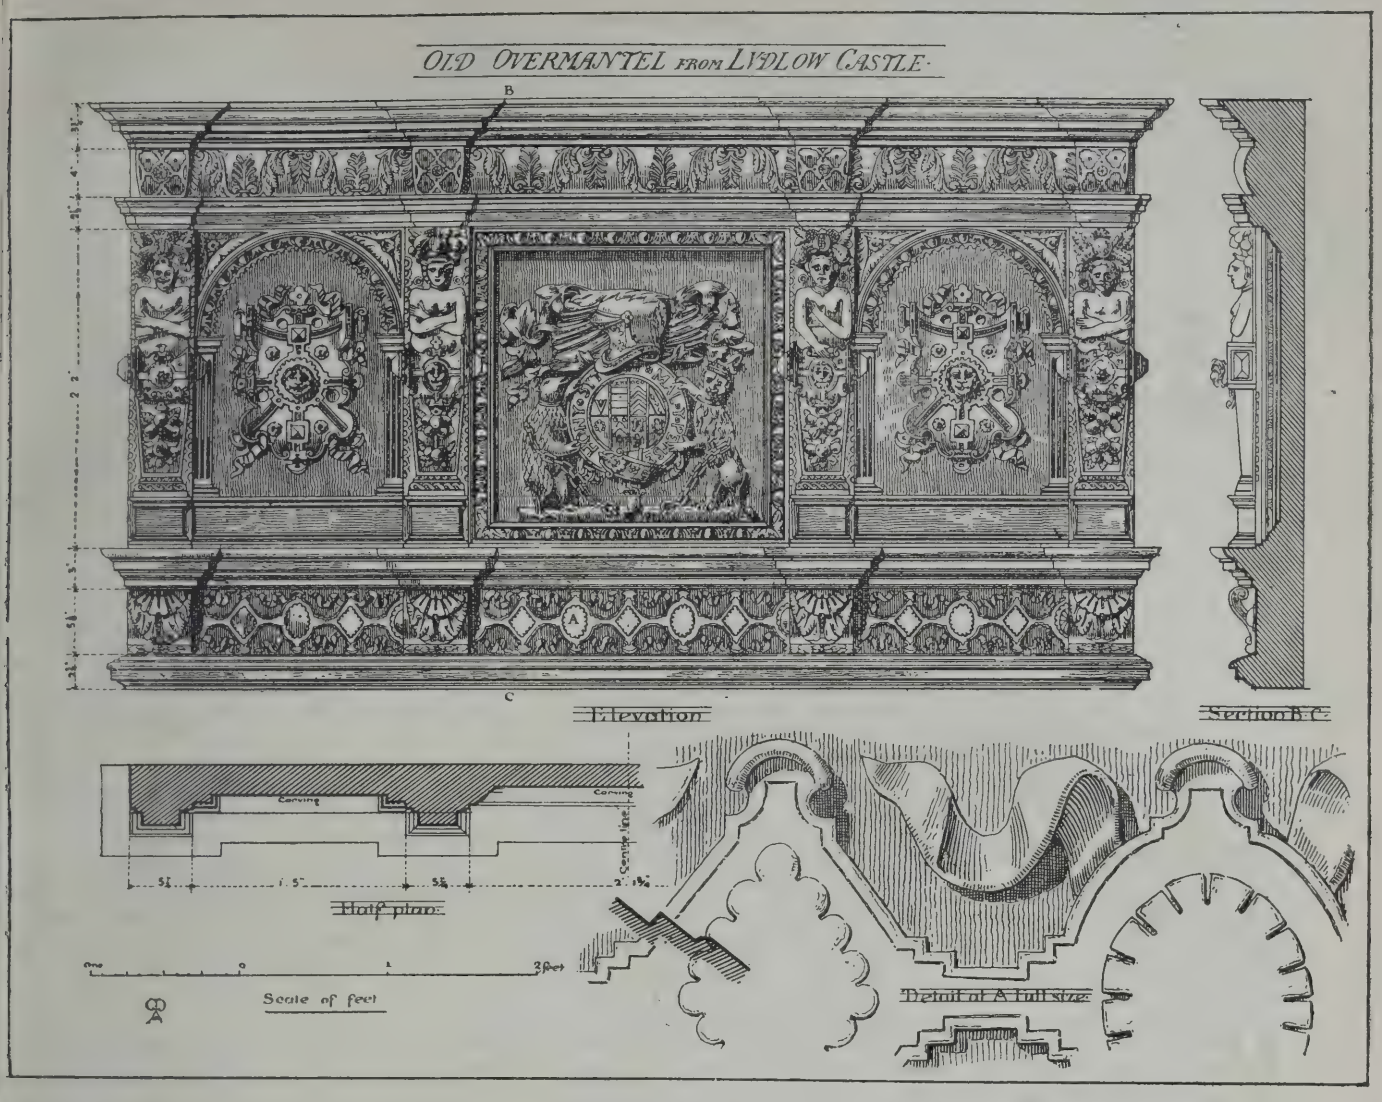
THE REMOVAL OF SEWAGE AFTER LEAVING BUILDINGS.

Mr. Reginald E. Middleton, M.Inst.C.E., said that the increase in the size of towns had necessitated the transportation of sewage to much greater distances than was formerly thought re- quisite, entailing in turn increased cost when sewage and storm-water were mixed, and this had stimulated inquiry as to the possibility of dealing with sewage in a more economical way. Such inquiry had led to the trial of the earth, the pail, the closed cesspit, and the separate systems. The four systems were criticised in detail. The advantages of the separate system were catalogued, and though the author ad- mitted that practical difficulties existed which militated against its adoption, these were not insurmountable, and it offered so many facilities for the economical disposal of sewage, that the objection to its use, with one exception, almost, if not entirely, disappeared. The exception was that the adoption of the separate system neces- sitated the turning of the washings from houses, streets, and yards into the nearest watercourse, and he was not prepared to claim that such a course of action was absolutely safe. In many cases the use of compressed air for lifting sewage was more economical than either water or steam.



WATER SUPPLY.

Mr. A. R. Binnie, chief engineer to the London County Council, read a paper on "Water Supply." There were two facts of which they might be confident—first, that water subject to pollution was a very potent factor in the spread of disease; and, secondly, that there was possibly no better mode of intro- ducing into the human system any substance which it could absorb than by drinking it in the form of a solution. This being the case, it almost followed as a natural consequence that the utmost care should be taken to guard our supplies of drinking water from contamination. Wells were frequent sources of death and disease, due to the contamination from house-drains. Chemical science in many cases was of little assistance, as it was powerless to detect the germs of disease. Neither filtration through sand nor the precipi- tation and clarification of sewage effluent by chemical agency could be altogether relied on.



The architectural papers to be read to-day (Friday) include "English Isolation Hospitals," by Dr. R. Thorne Thorne, of the Local Government Board; "Description of the Heathcote Hospital, Leamington," by its architect, Mr. Keith D. Young; "Temporary Local Isolation Hospitals as opposed to a Central Hospital," by the Rev. C. E. Few, vicar of Seal, Sevenoaks; "Hospital Tents and Huts," by Dr. Duchausoy; and "Asylum Arrangement and Construction," by Dr. Richard Greene and Mr. G. T. Hine, F.R.I.B.A. To-morrow (Saturday) will be devoted to excursions, and on Monday the closing meeting of the Congress will be held in the theatre of London University.

ARCHITECTURAL ASSOCIATION EXCURSION IN SHROPSHIRE.—No. II.

THE proceedings of this excursion commenced last Monday. Before describing the places visited in the exact order of the programme, we will refer to our illustrations to-day, which show some of the buildings seen during the week. Last Friday we illustrated and described Stokeley Castle, seen yesterday, on which occasion *Ludlow* was visited. Beyond compare for the sylvan beauty of its grand position, and first among the foremost of the military strong- holds of the Middle Marches of Wales, the his- toric castle at Ludlow has always been the glory of the great border district of Shropshire since the time when Roger de Montgomery built it, soon after the Conquest. As a notable specimen of military, palatial, and to some extent eccle- siastical architecture, the buildings even now are of the greatest interest to the practical architect, while, of course, to the antiquary its historic associations present attractions of the highest order. Eyton has told us its earlier history, and Wright has elaborated the pages of later times, leaving to G. T. Clark the task of describing in exact detail the military particulars of the fabric itself. The castle stands crowning the old town of Ludlow on a rocky promontory, which projects at a height of above 100ft. over the union of the Corve with the Teme. Adjoin- ing the castle is the ancient cruciform Parish Church, with its lofty tower. The general enceinte of the place was formed by the town walls, fragments of which may still be seen, and a capital plan of the town published in Baker's book (issued by Mr. Woolley, of the Bull Ring), shows their exact extent very clearly. The castle is composed of an inner, middle, and outer ward. The inner ward occupies the south-west angle of the middle ward and is roughly rectangular some 66ft. E. and W. by 42ft. N. and S. The south wall divides it from the outer ward, and forms part of the general enceinte. This ward has three towers, the keep, the gatehouse, and the postern, at its S.E., S.W., and N.W. angles.

We give a plan which readily will explain these references. The accompanying view shows the keep and the gatehouse, which form part of the buildings erected against the Norman south curtain by Sir Henry Sydney, the preux chevalier of the days of Spenser and Raleigh. Along the north side of the middle ward is the grand mass of the state and domestic apartments, with the buttery tower, the great hall, square tower, and the rest. This block of buildings, which forms the chief feature of the castle, is of great height, and of lordly scale, in a quaint mixture of Norman and Decorated date. The kitchen is located against the wall of the inner ward, and in a central position of the middle ward stands the celebrated circular Norman chapel, attributed to Jocelyn de Dinan (1130-1135), and dedicated to St. Mary Magdalen. It is now denuded of its chancel, which formerly abutted upon the curtain, as shown by the dotted lines on our plan. This chancel was standing in the reign of Charles II., and the large chancel arch remaias still. The Norman W. doorway arch to the chapel is a specially rich and handsome example. The nave is 28ft. in diameter, with walls 4ft. thick, and arcaded inside. In the outer ward only a few buildings remain standing. The centre of its curtain is occupied by the outer gatehouse, and on its south are some Tudor buildings intended for stabling. The Early square tower on the east wall marks the extent of the Norman Castle. Mortimer's tower, rising on the west side of the ward, is semicircular on plan, and overlooks the river. It is Early English in style, and here Hugh Mortimer was imprisoned, they say, about 1150. The building looks later than this period, but that is a minor detail. It has additions of Tudor date. A public footpath runs through a portion of the outer ward, where a part is walled off, and the two modern doorways cut in the curtain show clearly its thickness. From this point a second slope of some 60ft. leads down to the meadows below where the streams, stilled by the mill-weirs lower down, flow sluggishly along. The noble trees which enhance the grounds and form the avenue were planted by the Countess of Powis in 1772. At the north-west corner is a group of towers forming the angle, and containing the buttery. The first has a rectangular projection, and connected with this is a second tower half-octagon on plan, much patched and added to. This group, rising from a battered base, is very lofty. The private apartments are of Decorated date. In the garderobe tower base are three large Perpendicular windows of two lights with tracery, and above are the timbers of two balconies. The keep stands on the higher part of the inner ward, and being placed upon the enceinte formed part of the general line of defence. Its original plan is peculiar, in that it had two projections or ea and so was slightly T-shaped, and had commu cations right and left through the arms of the with the curtain wall on which it stood, so th this unusual exception to the jealousy wi which the entrances to Norman keeps we guarded, rendered the building rather a lar mural tower than a keep proper. Roger de La built it between 1086 and 1096, and it had a hi pitched gable-roof, like the gatehouse at Sherbor Castle; but the side walls probably were nea as high as the gables, to conceal the roof. T postern tower is spiked up, and inaccessible. T middle ward is the most important division the castle, and we have already referred to buildings in general terms. The hall is a nol one, though roofless now and without a floor. is 60ft. long and 30ft. broad, and 35ft. to t corbels which supported the hammer-beam roof timbers. The three windows overlooki the courtyard are trefoiled, and have transon One only has a stone seat. The middle one h been blocked up by a Tudor fireplace. No dou the original grate, as at Stokesay a Penshurst, stood in the central space the hall. The buttery tower comes ne to the hall. The state rooms at the oth end contain much to interest the archite although they are very considerably ruined. T stone hooded fireplaces are very good, and t

windows, of varied dates, contain remains of good detail. The gatehouse is approached from the middle ward by a bridge over the ditch. In the wall above the low pointed arch, on a tablet, are the arms of Elizabeth and those of Sir Henry Sydney, of Penshurst, with the date 1581. There is no portcullis. Probably the original entrance was by a mere archway in the curtain, as at Kenilworth and Bridgenorth. In Tudor times Ludlow Castle, originally a purely Norman fortress, was converted into a palace for the Presidents of the Marches, Sir Henry Sydney being the first official of that style. The base of the keep became a prison, and afterwards, when the extinction of the Council of Wales took place, followed by the Civil Wars, a stop was put to any outlay on the place, which soon became pillaged of all kinds of fittings in lead, iron, or timber, until it presented a complete ruin. The final collapse came in George I. reign, when the lead from the roof was removed; but many of the rooms remained entire so late as 1774. In 1811 the Powis family purchased the freehold from the Crown. The visitor may lift the latch boldly at the postern—there is no warder now to challenge—and enter the outer court. The view alone will repay a climb to the topmost height of the castle, and the place is well kept and cared for. We print two details of Elizabethan fireplace fronts from Ludlow, drawn by Mr. Arthur Marshall, and among our lithographic plates will be found a view of the keep, seen over the moat from the outer ward. In the corner is a plan of the castle; with a reference table. The other lithographic plate includes a capital photograph of the market-house at Shrewsbury and some old houses in the town. Many of these old houses are very much modernised, and all are overladen with black mastic or paint. Some are greatly shams in what has been called the half-brick timber style, with timber lines painted over the brick walling. Elsich House, drawn on the other plate, is a stone house, near Ludlow, with an octagonal timber bay characteristic of the district, simple, quiet, and unassuming—all qualities of great value in good architecture. Moreton Corbet we shall refer to next week.

Wroxeter Church, first seen on Monday, is chiefly Norman, and principally worthy of a visit on account of its uncommon Renaissance altar-tombs, the recumbent statues of which are remarkable for the freshness of their colouring and ornamentation. So accurate are these alabaster figures as studies of costume, that their details exactly show the several details of contemporary fashion. Thus, the ladies' shoes vary. In the earliest of the three tombs the toes are square and broad, in the next they are pointed in the shoe, and in the third high heels, then in vogue, are added. The western tower of the church is of fine outline, and has a singular patchwork character, with bits of various dated ornament and carving built in. A very poor south porch has lately been added. The two pillars at the churchyard-gate are of Roman date, and were found in the neighbouring river some years since. The ruins of Ur-i-conium were visited, when the hypocaust was seen, the Roman walling and the mosaic pavement, so wonderfully preserved, at the end of the inclosure, once occupied by the Chalcidicum attached to the Basilica. The interest and importance of these remains is, of course, very great, and the coins, glass, pottery, Samian ware, and fibulæ found here have been considerable, both in number and variety.

Buildwas Abbey, next seen, was a cruciform building, founded by Cistercian monks between 1135 and 1160, and erected by Bishop Roger de Clinton, of Chester, on the site of an older establishment, occupied by a Bishop of Lichfield. The remains now comprise a good part of the walls of the church and the groined chapter-house. Rickman gives a brief account of it, comparing it to Kirkstall in the matter of its having round arches exteriorly and pointed arches within. The choir, in the common fashion, was erected first, and the work generally is very bold and severe in character. Over the parallelogramatic chapter-house, which is vaulted, was the dormitory at the easternmost boundary of the cloisters. The restored abbot's house contains the chapel and a large 13th-century hall, with a chestnut roof. There is no rich detail in the ruin, which is well situated on the banks of the Severn. If we remember rightly, the building was carefully measured up some years ago by Mr. W. Talbot Brown, who was awarded the R.I.B.A. medal for his work. The party walked some two miles and more through the fields and over the hill to *Benthall*. Here the church, a simple building erected in 1667, presents nothing within its externally whitewashed walls to detain the visitor; but the little church has a font of Roman origin, and the fabric and services seem admirably well cared for.

Benthall Hall, for some years the residence of Mr. Maw, of encaustic-tile celebrity, and now in course of painting and renovation, is an Elizabethan house of 1535. It did not improve the house to introduce the incongruous tiles of all colours with which Mr. Maw lined the entrance and paved the great hall. The stone-built garden front has two big semi-octagonal bays of handsome proportions, and a square one, possibly of later date, between them. This forms the entry. The sky-line is composed of three small gables, with larger ones of lean-to outline at the ends, an irregular composition of simple detail but effective in design. The chimneys are of brick. Inside the house the rooms are richly panelled, and have Jacobean florid chimney-pieces. There is a handsome Elizabethan staircase, much good furniture and some pictures, chiefly by the occupier, Mr. Bateman, who has exhibited some designs as an architect at the Academy, and showed the same to the excursionists.

Much Wenlock, though little more than a village, is justly celebrated for its great abbey, famous for riches, and renowned for temporal influence and historic associations. First a

nunnery where King Penda's grand-daughter, St. Milburgh, was buried. Lady Godiva of Coventry, in the days of Edward the Confessor, with her husband, Leofric, Earl of Mercia, chose the spot for a church; but in less than half a century one of the Conqueror's favourites obtained its disposal and founded the existing abbey in association with the Benedictine Abbey of Clugny, and erected the first part of the buildings. The Crown seized the place in Edward III.'s reign, and Richard II. proclaimed the Priory denizen, and henceforth it was independent of the foreign establishment. We publish herewith a plan of the main buildings as they now stand,* but the ruins, all told, include 30 acres. The south aisle, with the library over it, parts of the transepts, the chapter-house, and the abbot's house (now occupied by Mr. Gaskell as a country residence), may be described as being of 15th-century date. The excellence of the Early Transitional architecture represented by the Abbey Church is unquestioned. It was probably the work of Roger de Montgomery, of Ludlow Castle. The Perpendicular abbot's house, of which we to-day illustrate the plans (a detail of the cloister façade was printed in last week's BUILDING NEWS), has all the apartments opening into a cloister or gallery on both floors, and lighted by a row of closely-set windows cleverly grouped in bays between handsome buttresses. These openings were glazed about 30 years ago. In the Oratory is the old stone altar, situated in the bay recess, and having a carved stone reading-desk upon it (see "Glossary of Architecture," page 2). The abbots' hall upstairs, now used as a dining-room, has a good timber roof, with framed and cusped purlins. The deeply-recessed Mediæval windows, grouped in pairs, have curious octagonal brackets supported on shafts in lieu of the usual step seats, and they are too high to have been intended for such a use. The abbot's parlour, now a drawing-room, had a part screened off for a passage, with a staircase at the end of it leading to the room above. The doors are handsomely moulded with battlemented hoods, and the water drains and corbels are particularly worthy of notice. The building is unique in its way in England, though the same idea of a gallery was not uncommon in our old inns and taverns down to a late period. Last week we illustrated the Guildhall and the Gatehouse up the street.

Whitehall House, with its gatehouse and pigeon-cote, were visited at starting on Tuesday, and we give a view of the building among our plates to-day. The garden front is the best, as seen in the drawing. The detail of the building is simple enough, but the row of gables with the turret in the centre makes a good group.

Plaish Hall, erected in the reign of Henry VIII., with continuations of somewhat later date, is a small, but rich, brick-built house, akin to Compton Wyneates. It is situated several miles from Church Stretton Station, midst the hills, and commands a fine view. The house was added to somewhat cleverly some six or eight years ago by Mr. Charles Sayer, the architect, son of the owner. The hall is very good, and has an Elizabethan hammer-beamed roof, with bold arched timbers to the principals, a trifle incongruous in scale. It is partly ceiled, and has a florid screen of this date—or rather, later—at one end in the usual fashion of the period. There is much rare old furniture in the house. The oak parlour is a good room, with a handsome inlaid chimney-piece and an exceedingly rich cast-iron hob grate, with panels of Scriptural subjects well, but quaintly, modelled. The ironwork in the house is old, and worthy of note. Outside the tintings of the walls and the stone slate-covered roofs combine to make a first-rate study of colour. To the rear side two octagonal turrets containing staircases run up, and are surmounted with ogee lead-covered roofs of not very happy contour. These are new. The cut-brick chimneys are among the chief features of the house.

Shipton Hall is a work of about the year 1589, with parts dated 1670, and during the end of the last century the interior was denuded and transformed in a coarse style of Classical taste, so as to be now devoid of interest. The house stands well up above the road on a terrace raised by a series of three sets of steps, and has an inclosed forecourt garden very prettily set out and planned. The building is very plain in detail, and has a square tower over the entry, the front doorway being, as at Benthall, placed on one side of it in the return face. A large group of stable buildings in a Georgian mode stand to the right hand of the approach to the house, and are excessively commonplace and poor. The church hard by was rebuilt and altered in 1589, when the chancel wall was opened out on either side of the chancel arch, and so there are now three arches, one large and two small, opening into the nave. The square western tower has a timber belfry and a conical spire. In the church are some rich incised slabs to the Mytton family, and a painted heraldic one in a frame supported by a queer piece of ironwork. The church is fairly clean; but the churchyard is in a disgraceful state. Mr. John L. Robinson, A.R.H.A., of Dublin, took a group of the party in front of Shipton Hall, and Tuesday's proceedings were concluded by a railway journey back to Shrewsbury, where the excursionists made for their hospitable quarters, the George Hotel.

* The parts indicated in black are complete, the parts hatched are above the ground level, and the outlines show conjectural parts.

BOOKS RECEIVED.

Concrete: its use in Building and the Construction of Concrete Walls, Floors, &c., by THOMAS POTTER, illustrated, Vol. I. New Edition, rewritten (Winchester: *Hampshire Advertiser* Company), is a new edition of a very useful little treatise on concrete and its practical application to building. Mr. Potter is an authority on the subject well known to our readers, and his contributions on this valuable material to our own pages are still remembered. This little volume, published 14 years ago, has been rewritten and brought up to date, and contains practical information on the aggregates and matrices used, the making of concrete, concrete foundations, shrinkage of concrete, &c. The present volume does not enter into the question of concrete for architectural purposes, such as walls, lintels for openings, arches, domes, and other decorative features; but deals very fully with all necessary information respecting its composition and use. Mr. Potter's remarks on the "aggregates" suitable for concrete for particular uses are of value. Thus, he observes that while "crushed flint makes an excellent aggregate for wall construction," it is unsuitable for floors on account of its weight, its inelasticity, and its behaviour under heat. Thus for floors, firebrick or coke breeze aggregates are better, as they expand less under heat than flint. Slag, furnace clinker, and burnt clay are all good aggregates for floors, because they have been subjected to the action of fire. Old building materials, when broken up and crushed, make capital aggregates; and, as the author says, may often be economically employed for making concrete for foundations, basement pavings, and walls, instead of being carted away for road-making and filling, particularly on estates where new buildings are being erected on the sites of demolished ones. Mr. Potter recommends a "Blake" stone-crusher as being unsurpasssed for the purpose of crushing materials: it can be obtained from 1 man to 20H.P.; a 4H.P. machine is a convenient size for general use, and it will break 30 to 40 tons a day of any hard material. Of course, a crushed aggregate requires cleaning from dirt. Some useful experimental results are given, showing the tensile strength of cement when combined with different materials, and the crushing strength of concrete made with different aggregates. These show that Portland stone is a better aggregate than flint, ballast, or even pottery, and that a porous material and angularity of form are necessary qualities of aggregates. But a high compressive resistance may be often less necessary than cohesive strength. These conditions do not go together, so that discretion in the selection of a suitable aggregate is necessary. Many of the results are taken from Mr. Grant's experiments, the treatises of Pasley, Reid, and Kirkaldy. The various kinds and qualities of limes and cements as matrices are dealt with, and, as the author says, the improvements in burning and heating limestone and new cements have rendered obsolete much of the old practice. A useful summary of points to be observed in the use of Portland cement as a matrix is given on page 106, and the author gives a useful specification adopted by the late Metropolitan Board of Works, and also by the London County Council and the Forth Bridge engineers. Space renders it impossible to quote many useful remarks on the subject of concrete foundations. The volume will be found a practical guide to the architect and builder.——*The Stonemason and the Bricklayer*, by various practical writers, edited by the Editor of the *Industrial Self-Instructor*, with plates and illustrations in text (Ward, Lock, and Co.), is a comprehensive volume on the arts of masonry and bricklaying, including notes on the materials used. The volume is a reprint of a series of articles which have appeared in the *Industrial Self-Instructor*, published by Messrs. Ward, Lock, and Co., for home study. Every principle and technical requirement of the two trades are set out in a popular manner, and illustrated by numerous blocks in the text. Every kind of stone walling, rubble as well as tooled or dressed ashlar work, bond, ashlar and coursed rubble combined, details such as weathered and throated sills, joggled work, cramping and other means of uniting stone blocks, cornice construction, window mullions and heads, quoins, tracery, arches, foundations, are explained and illustrated. The same attention is bestowed on the bricklayer; the principle of bond is fully explained as far as it relates to walls and square angles, and the construction of simple arches. Ornamental brickwork is very summarily dismissed. The diagrams are numerous, and but for imperfect lettering in some cases, intelligible as far as they go, and the treatise will be found useful as a preparative study to more exact textbooks on the arts.——*The Transactions of the Edinburgh Architectural Association.* No. 3 of the first volume of these Proceedings has just been issued. It contains records of some of the visits made by the members during the session just closed, and also brief notes of visits paid to various buildings in 1884-5-6; the illustrations include Gosford House, as successively designed by the Brothers Adams, Wm. J. Barr, and Mr. William Young for the Earls of Wemyss and March; Wintoun House, built from the plans of William Wallace, master-mason to the King, c. 1620; Pencaitland Church; Fountainhall House, a Late 15th-century edifice; and Dundee Town-hall, one of the works of William Adam.

CHIPS.

A Sunday-school is about to be added to the Primitive Methodist Church at Blackhill, Benfield-side, co. Durham, from plans by Mr. Joseph Shields, of Sunderland.

Mr. James Brunton, builder, Jedburgh, has been appointed road surveyor for Jedburgh district, in room of Mr. M'Intyre, resigned.

In a report addressed to the Prefect of the Seine with regard to the municipal and other free libraries in Paris and the suburbs, it is stated that they now number 64, and that they are attached to the different town halls and communal schools.

A memorial stained-glass window has been placed in the south side of Pembroke Chapel, Clifton, Bristol. The subjects are Christ as the Light of the World, and as the Good Shepherd. Messrs. Joseph Bells and Sons, of College-green, Bristol, were the artists.

The rebuilding of Earl Portsmouth's house at Hurstbourne Park, near Andover, which was destroyed by fire last winter, is to be commenced in October. The new house, which is to be erected on the site of the former building, will be a comparatively small structure, in the Jacobean style.

Col. C. H. Luard, R.E., an inspector to the Local Government Board, held an inquiry at the Town Hall, Ripon, on Wednesday week, with respect to an application by the City Council for sanction to borrow £4,000 for the purposes of water supply. The £4,000 included the overdrawn balance £745, estimated cost of new service reservoir at Whitefields—for which plans and estimates had been prepared by the City surveyor and waterworks' manager—£2,900; land, boundary fence, compensation, &c., £300; contingencies, £54 15s. 8d. The service reservoir would contain about 750,000 gallons, or three days' supply for the city. The population of the city at the last census was 7,512.

A new organ, built by Mr. J. J. Binns, of Bramley, Leeds, was recently opened at Rawdon Wesleyan Chapel. The organ is in an oak case, and of Gothic design, with decorated front pipes. The cost of the new instrument is some £500.

The Stafford board of guardians have under consideration plans prepared by Mr. G. Wormal, a local architect, for new buildings and alterations at the workhouse. The plans provide for a new infirmary chapel, detached fever wards, and alterations to present buildings. The estimated cost is £4,000.

ILLUSTRATIONS.

INTERIOR OF THE SELECTED DESIGN FOR THE NEW SOUTH KENSINGTON MUSEUM BUILDINGS BY MR. ASTON WEBB.—EXTERIOR OF MR. WILLIAM EMERSON'S DESIGN FOR THE NEW SOUTH KENSINGTON MUSEUM BUILDINGS.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES IN SHROPSHIRE.—TOWER CHAMBERS, EASTCHEAP.

Our Illustrations.

SOUTH KENSINGTON MUSEUM BUILDINGS.

We give this week two illustrations—the first being a double-page sketch view, showing the interior of the entrance hall of the selected design by Mr. Aston Webb; and the second the exterior view of the design submitted by Mr. William Emerson. We should add that in our review last week of the competition drawings, we wrongly attributed "Verona" to Messrs. Deane and Son, and "ΤΕΧΝΗ ΤΥΧΗΝ ΕΣΤΕΡΞΕ ΚΑΙΤΥΗ ΤΕΧΝΗΝ" to Mr. W. Young. "Verona" is Mr. Young's design, and the other Messrs. Deane's. Of course, no names were appended to the designs exhibited, and we had to arrive at our own information as to the authorship, which turns out to have been right in each other instance. We are requested to state that the designs submitted in competition for the completion of the buildings of the South Kensington Museum are now on view at that Museum from 10 till 6.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

We continue from last week our illustrations of the A.A. visit to Shropshire, now in progress. A full description of the buildings shown appears on p. 213.

At Friday's meeting of the County Council for Northumberland, a special committee appointed to consider the county architect's salary reported that from 1879 to 1890 the salary and commission had amounted to £520 per annum. The committee recommended that a fixed salary of £520 a year be paid, instead of salary and commission as hitherto, that the architect's travelling expenses be allowed him, and that the privilege of taking work other than county work be continued to him. The report was referred back to the committee.

At the Midland Railway meeting on Friday, the chairman, Mr. G. E. Paget, said that during the last ten years the company had spent over half a million sterling on the maintenance and renewal of bridges, but since the accident on the Brighton line, Mr. Macdonald, their engineer, had made a further report on the condition of their bridges, and he had reported that there was everywhere a large margin for safety. It was, however, intended to proceed with the reconstruction of the 181 cast-iron bridges, upon which they proposed to expend £85,000 in the present year. At the meeting of the Great Northern Company on Monday, Lord Colville dealt with the same subject of the reconstruction of railway bridges, and stated that for some years his company had been carrying out that work, and substituting steel and wrought iron for the original cast iron and timber. £10,000 had been devoted to this purpose during the past half-year.

THE SOCIETY OF ARCHITECTS' VISIT TO BELGIUM.

THE following is the final programme of the most interesting excursion to Belgium of the Society of Architects, which begins to-morrow. Several alterations have been necessary to meet the arrangements of the Institute of Architects of Belgium, which is interesting itself fraternally in the visit, and will at various points co-operate:—

Saturday, Aug. 15.—Train leaves Charing Cross (S.E.R.) at 10.0 a.m. Train leaves Cannon-street at 10 5 a.m. Boat leaves Dover Pier at 12.0 noon. All luggage must be labelled for Ostend at least ten minutes before the time of departure. Lunch on board the boat, not included in ticket. 4.0 p.m., arrive at Ostend. Attend audience to be granted by His Majesty The King of the Belgians. Dress clothes will have to be worn at the audience. Dressing-rooms will be provided at Hôtel du Kursaal et Beau Site. 6.30 p.m., dinner at Hôtel du Kursaal et Beau Site, Ostend. 8.44 p.m., train from Ostend Station to Bruges. 9.7 p.m., arrive at Bruges. Sleep at Grand Hôtel du Commerce, Bruges.

Sunday, Aug. 16.—Breakfast, lunch, and dinner at Grand Hôtel du Commerce, Bruges. English Church, Rue d'Ostende; services at 11 a.m. and 7 p.m.

Monday, Aug. 17.—8.30 a.m., breakfast at Grand Hôtel du Commerce, Bruges. 10.30 a.m., visit Hôtel de Ville (1376 to 1387). 2 p.m., lunch at Grand Hotel du Commerce. 3.30 p.m., visit Cathedral of St. Sauveur in the Grande Place (13 and 14 cys). Note: Other places worth seeing are the Church of Notre Dame (13th to 15th cys.) near Cathedral; a shop in the Rue St. Amand; the Tour des Halles (Adelaide Proctor's "Belfry of Bruges"); Houses in Rue de la Pierre and in the Square "Van Eyck." 6.3 p.m., leave Bruges for Ghent. 6.53 p.m., arrive at Ghent. 7.30 p.m., Dinner at Hôtel Royal, Ghent. Sleep at Hôtel Royal, Ghent.

Tuesday, Aug. 18.—8.30 a.m., breakfast at Hôtel Royal, Ghent. 10.30 a.m., visit to Cathedral of S. Bavon (Crypt 941, W. portions 1228, choir 1274 to 1300, rest 15th and 16th centuries). Met at door by M. Van Assche, cathedral architect. 12.0 a.m., visit the ruins of the Abbey of St. Bavon (several portions are primitive Roman work). 1.30 p.m., lunch at Hôtel Royal. 3.0 p.m., visit Hôtel de Ville, Rue Haut Port (1481-1553). [Note: Other places worth seeing are the old houses in the Marché du Vendredi, and on the Quay aux Herbes (Skipper House, 1531); the Oudenburg, where John of Gaunt was born in 1340; and the house of the Corporation des francs Bateliers (1669), pont du laitage; the Archæological Museum, Rue Longe des Pierres; the Château of the Counts of Flanders (12th Cy.), the Halle aux Draps, the Château of Gérard-le-Diable, and the Belfry.] 5 0 p.m., leave Ghent (Sud) for Antwerp. 6 29 p.m, arrive at Antwerp. 7.30 p.m, dinner at Hôtel St. Antoine, Antwerp. Sleep at Hôtel St. Antoine, Antwerp.

Wednesday, Aug. 19.—8.30 a.m., breakfast at Hôtel St. Antoine, Antwerp. 10.30 a.m., visit Hotel de Ville. 1.0 p.m., lunch at Hotel St. Antoine. 2.30 p.m., visit Cathedral (met by M. Baeckelmans, architect for restoration). 4.0 p.m., visit Charles V.'s Palace. [Note: Other places worth seeing are the Chapel of the Dukes of Burgundy, Porte de l'Escant, Hospital des Orphelines, tower of the Church of St. Charles Borromeo, the 'Maison des Bateliers in the Grand Square, and Quentin Matsys' Well, the Churches of St. Jacques, St. Paul, and St. Amand; the new Stenvenberg Hospital; the Royal Atheneum, and the new Musée des Beaux-Arts.] 7.30 p.m., dinner at Hôtel St. Antoine.

Thursday, Aug. 20.—8.30 a.m., breakfast at Hôtel St. Antoine, Antwerp. 10.43 a.m., leave Antwerp for Malines. 11.9 a.m., arrive at Malines. 11.30 a.m., visit Cathedral of S. Rumbold, met by Canon Van Caster. 1 30 p.m., lunch at Hotel Buda, Malines. [Note: La Halle and the Palace of Margaret of Austria adjoining, and many old houses on the canal and river fronts are worth seeing, as is also the old gateway of the town.] 5 29 p.m., leave Malines for Brussels. 5.52 p.m., arrive at Brussels. 7.30 p.m., dinner at Grand Hotel de l'Empereur, Brussels. Sleep at Grand Hôtel de l'Empereur, Brussels.

Friday, Aug. 21.—8.30 a.m., breakfast at Grand Hôtel de l'Empereur, Brussels. 9.40 a.m., leave Brussels for Louvain. 10.15 a.m., arrive at Louvain. 10·30 a.m., visit Cathedral. 1.30 p.m., lunch at Hôtel de la Cour de Mons. 2.30 p.m., visit Hôtel de Ville. [Note: Other places worth seeing are a Romanesque doorway in Rue de Malines; a brick-fronted house (14th century); Cæsar's Castle, near Malines Gate; and the stalls in the church of St. Gertrude.] 5.55 p.m., leave Louvain for Brussels. 6.29 p.m. arrive at Brussels (Nord). 7.30 p.m., dinner at Grand Hôtel de l'Empereur, Brussels. Sleep at Grand Hôtel de l'Empereur, Brussels.

Saturday, Aug. 22.—8.30 a.m., breakfast at Grand Hôtel de l'Empereur, Brussels. 10.0 a.m., Members joining the party for the second week only, leave London (Charing Cross) for Brussels viâ Ostend, arriving at 6.19 p.m. 10.30 a.m., visit Hôtel de Ville (15th century). 12.0 noon, visit the staircase at the King's Palace. 1.30 p.m., lunch at Grand Hôtel de l'Empereur. 3 30 p.m., visit Cathedral of St. Gudule (founded 1010, mainly 13th century). 7.30 p.m., dinner at Grand Hôtel de l'Empereur. [Note: Other places worth visiting are the Porte de Hal, the Palace of Laeken (1782), the Maison du Roi, and a bay window in the Terasken.]

Sunday, Aug. 23rd.—8.30 a.m., breakfast at Grand Hôtel de l'Empereur. 1.30 p.m., lunch at Grand Hôtel de l'Empereur. 7.30 p.m., dinner at Grand Hotel de l'Empereur. English Church of the Resurrection, Rue Stassart, services 11 a.m. and 7 p.m., and Christ Church in Avenue de la Toison d'Or, services 11 a.m. and 7.45 p.m.

Monday, Aug. 24.—8.30 a.m., breakfast at Grand Hôtel de l'Empereur, Brussels. 9.14 a.m., leave Brussels (Midi) for Mons. 9.20 a.m., members joining the party for the first week only, leave Brussels (Nord) for London viâ Ostend. 10.23 a.m., arrive at Mons, received by M. Dosvelis. 11.0 a.m., visit cathedral of S. Waudru (1460-1580). 1.0 p.m, lunch at Hôtel de la Couronne. 3.0 p.m., visit Hôtel de Ville (1458-67). [Note: Other places worth visiting are the church of S. Elizabeth and the Palais de Justice.] 5.11 p.m., leave Mons for Tournai. 5.58 p.m., change at Blaton. 6.52 p.m., arrive at Tournai. 7.30 p.m., dinner at Hôtel de l'Imperatrice, Tournai. Sleep at Hôtel de l'Imperatrice.

Tuesday, Aug. 25.—8.30 a.m., breakfast at Hôtel de l'Imperatrice, Tournai. 10 30 a.m., visit the Cathedral of Notre Dame (nave, 1171, vaulted in 18th century, transept 13th century, choir 1388). 1.30 p.m., lunch at Hôtel de l'Imperatrice. [Note: Other places worth visiting are the Churches of St. Quentin, St. Jaques, and St. Brice; many old houses, especially in Rue de Paris; and the Convent Colestin.] 5.8 p.m., leave Tournai for Courtrai. 6.36 p.m., arrive at Courtrai. 7.30 p.m., dinner at Hôtel Lion d'Or, Courtrai. Sleep at Hôtel Lion d'Or, Courtrai.

Wednesday, Aug. 26.—8.30 a.m., breakfast at Hôtel Lion d'Or. 10.54 a.m., leave Courtrai for Audenarde. 11.35 a.m., arrive at Audenarde. 12.0 noon, visit Hôtel de Ville (1525-35). 1.30 p.m., lunch at Hôtel Pomme d'Or. 3.0 p.m., visit Church of St. Walburga (part 12th century, part 14th and 15). [Note: The Church of Notre Dame de Pamell is also worth seeing—13 century.] 6 p.m., dinner at Hôtel Pomme d'Or. 8.12 p.m., leave Audenarde for Courtrai. 8.46 p.m., arrive at Courtrai. Sleep at Hôtel Lion d'Or, Courtrai.

Thursday, Aug. 27.—8.30 a.m., breakfast at Hotel Lion d'Or. 1.30 a.m., visit Hotel de Ville (1526-28, restored 1846), and belfry. 1.30 p.m., luncheon at Hôtel Lion d'Or. 3.30 p.m., visit church of Notre Dame (1211). [Note: There are many old houses in the town, and St. Martin's church should be seen.] 5.22 p.m., leave Courtrai for Ypres. 6.42 p.m., arrive at Ypres. 7.30 p.m., dinner at Hôtel de la Tête d'Or, Ypres. Sleep at Hôtel de la Tête d'Or, Ypres.

Friday, Aug. 28.—8.30 a.m., breakfast at Hôtel de la Tête d'Or, Ypres. 10.30 a.m., visit Cloth Hall (1201-1304) and Hotel de Ville (1575). 12.30 p.m., visit Cathedral of St. Martin (1221-1254). 2.30 p.m., lunch at Hôtel de la Tête d'Or. [Note: The meat market and several old houses are also worth seeing, especially in Rue de Chiens and in the market place—the Guild houses.] 3.56 p.m., leave Ypres for Ostend. 5.55 p.m., arrive at Ostend. 7.30 p.m., dinner at Hôtel du Kursaal et Beau Site. Sleep at Hôtel du Kursaal et Beau Site, Ostend.

Saturday, Aug. 29.—8.30 a.m., breakfast at Hôtel du Kursaal et Beau Site, Ostend. 11.10 a.m., leave Ostend for Dover; lunch on the boat (not included in ticket). 3.20 p.m., leave Dover. 5.0 p m., arrive at Cannon-street. 5 5 p.m., arrive at Charing Cross.

Should any members care to remain in Belgium for a few days longer, they will find Dixmude, Furnes, and Nieuport well worth visiting, though little known. The boat tickets will be available up to and including September 11th. We shall fully describe and illustrate the visit next week.

CHIPS.

The question of appointing a permanent water engineer in place of Mr. James Watson, now engineer at Bradford, was considered on Friday at the monthly meeting of the Dundee Water Commission. The Works Committee recommended that Mr. G. S. Baxter, a former assistant of Mr. Watson, who has acted for six months, should be permanently appointed. The recommendation was adopted.

The sum of £4,550 has been raised, against £6,800 required, for the erection of the new church of All Saints, in the parish of St. Nicholas's, Sutton, St. Helens. The church, which is being erected from the designs of Messrs. Paley, Austen, and Paley, of Lancaster, is to contain 600 sittings.

The reopening and dedication of Hartwith Church, near Dacre Banks, in the North Riding, after renovation, took place on Friday. The alterations and improvements have been carried out by Mr. John Wilson, contractor, of Birstwith.

A copy of the bust of the late Sir Robert Peel, by Sir F. Chantrey, now at Windsor Castle, taken by permission of the Queen, has been placed in the Gladstone Library at the National Liberal Club, as a companion bust to those of Mr. Bright and Mr. Cobden. The copy is by Mr. Adams-Acton.

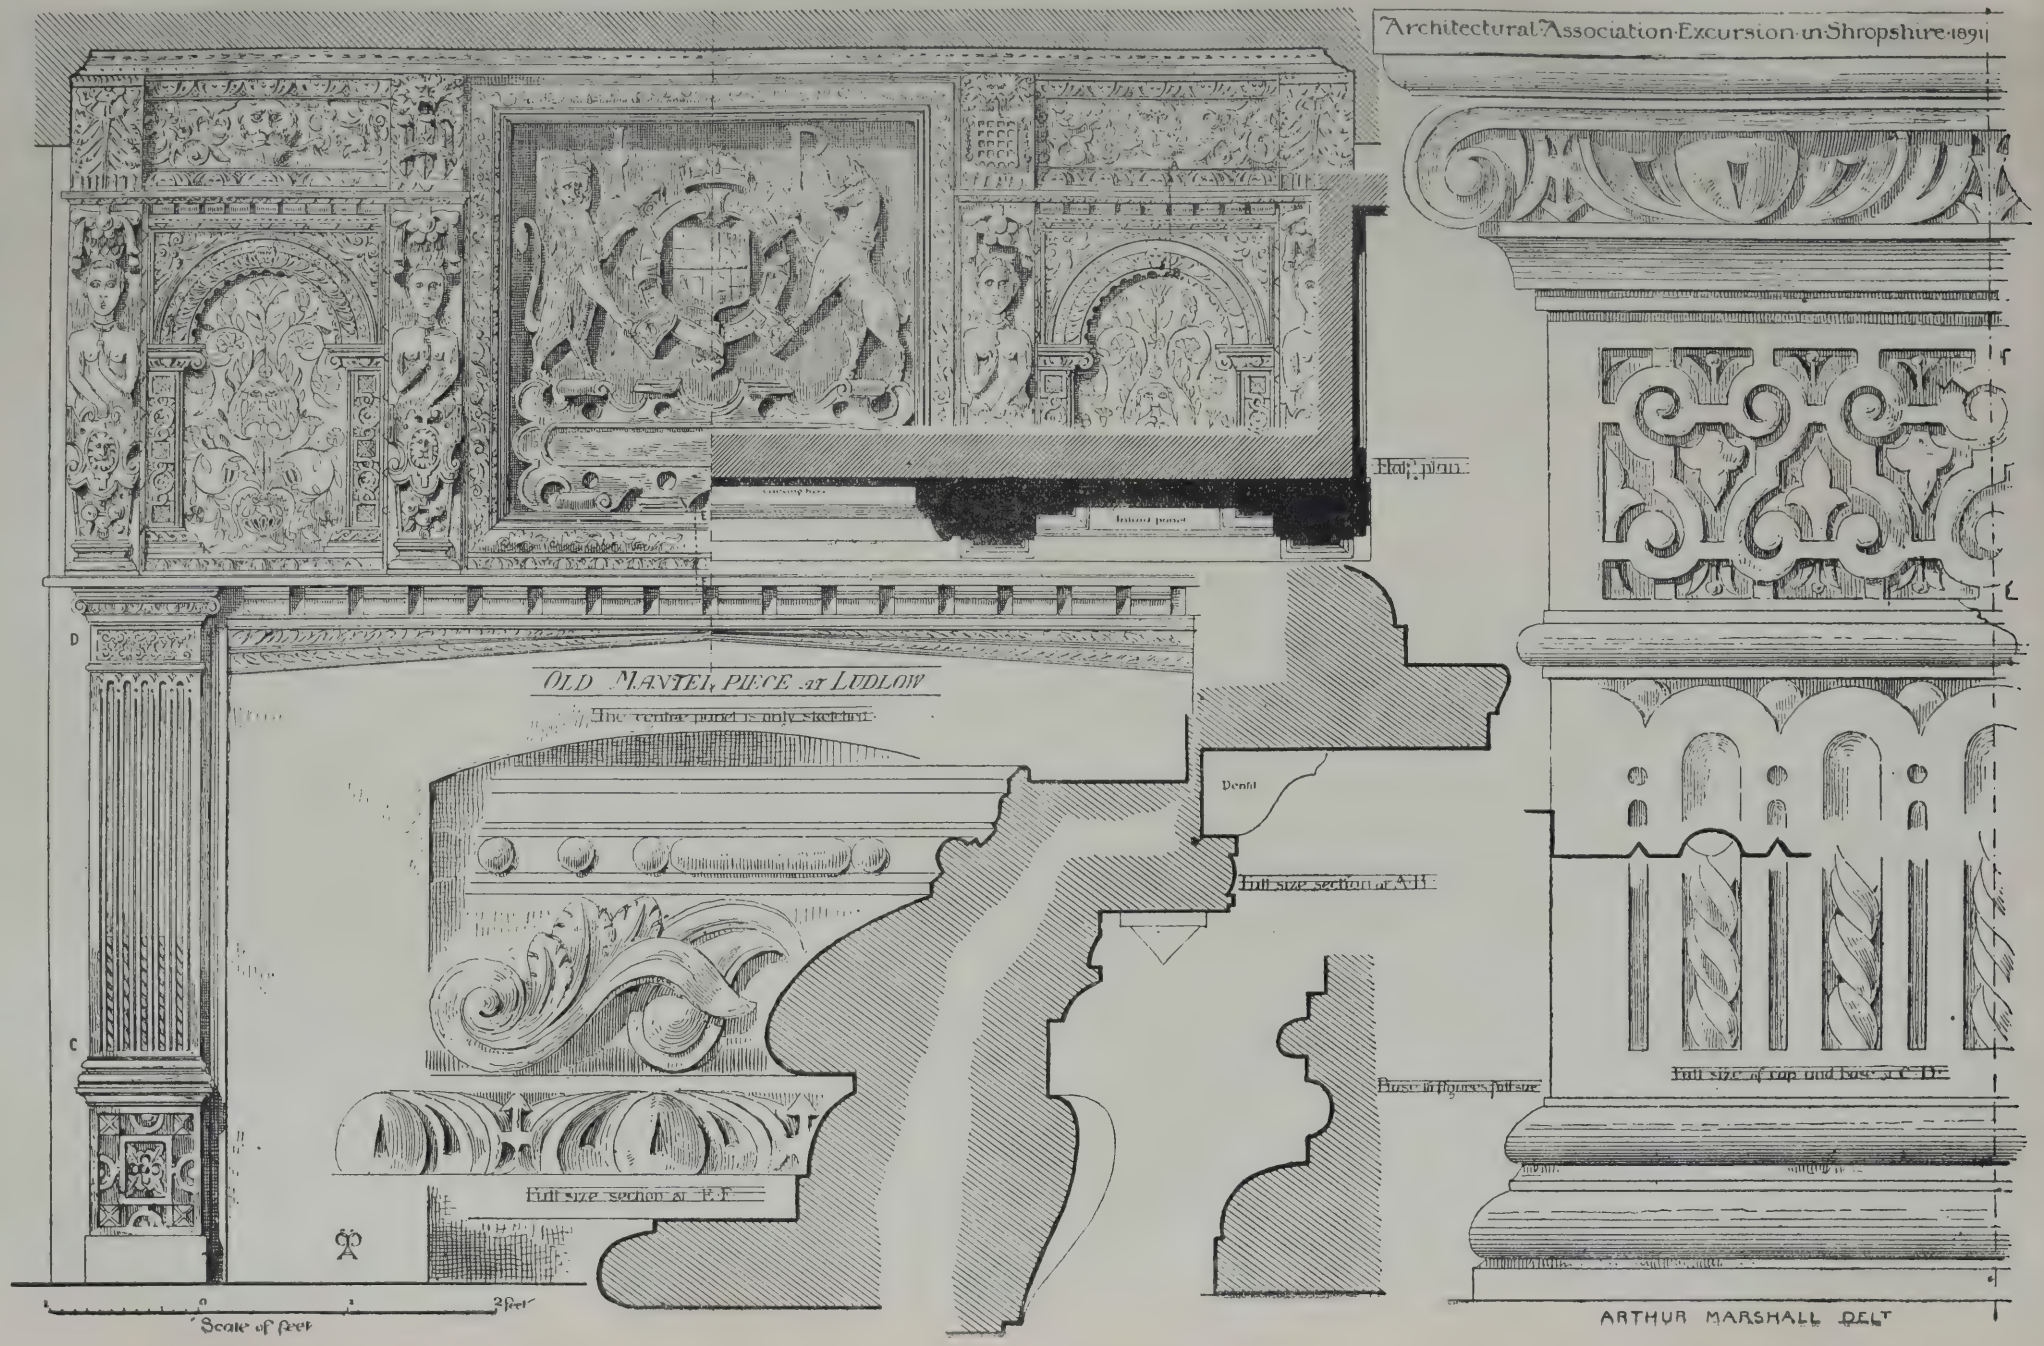
The Marquis of Dufferin opened, on Monday, Dunville Park, Belfast, the gift of Mr. R. G. Dunville, who has paid £8,350 to secure the Park as a free gift to the citizens of Belfast, and on Monday gave £5,000 more to pay the cost of inclosing, planting, and furnishing it.

The Batley School Board have adopted plans by Mr. H. B. Buckley, of Leeds, for a girls' higher-grade school, to be built on Field-hill.

Mr. Herbert Kirk, of Sleaford, has been elected County Surveyor to the County Council for Kesteven (South Lincolnshire). There were 16 candidates for the office.

At the quarterly meeting of the Cornwall County Council, Mr. Silvanus Trevail, M.S.A., called attention to the needlessly large securities demanded from contractors, and on his motion it was decided "That no contractor for the erection of buildings or other works to be paid for by the county shall be called upon to provide approved bondsmen as security for the faithful performance of the work to a greater extent than 20 per cent. of the full amount of the contract; and where such contractor is willing to make a cash deposit with the county treasurer to the extent of 10 per cent. of the contract, such deposit shall be deemed a sufficient security, and shall obviate the necessity of finding any bondsmen."

TOWER BUILDINGS, TRINITY-SQUARE, E.C.



THE above premises are situate on the east side of Trinity-square, Tower-hill, at the corner of Trinity-place, and front the large open area that adjoins the Tower of London. Part of the old wall of London is seen just by the building, and the look-out from latter is over ground full of historic interest. The District Railway passes under part of the site, over which the building is carried on girders spanning the tunnel; its Tower station immediately adjoins, being on the opposite corner of Trinity-place. With the basement the structure has five floors. It is erected in red brick furnished by the New Heather Colliery Co., who have also supplied all the moulded work and ornament in cornices, strings, caps, key-stones, scrolls, copings, &c., from the architect's special designs. The ground floor is used for offices and sale room, and the upper floors and basement as warerooms, &c. A crane is provided for goods, lifting from basement to second floor, and internally there is a lift for goods from basement to third floor. The frontage is a good one, and the whole of the premises exceptionally well lighted. The whole of the works have been carried out by the builders, Messrs. J. Allen and Sons, of Palmerston Works, Kilburn, from the designs, and under the superintendence of the architect, Mr. Thos. R. Richards, of 25, Bedford-row, W.C.

PATENT ENCAUSTIC AND GLAZED TILES.

A NEW catalogue of flooring and wall tiles has been published by Messrs. T. and R. Boote, of the Patent Tile Works, Burslem, and of Holborn-circus. One important feature to be noticed are the new arrangements and colours of some of the tile designs on plates 100, 102, 103, 104. We especially call attention to a nice arrangement of squares and intersecting lines in pattern No. 608. The dark tiles, set diamondwise in the centres of open squares, make a pleasing pattern, out of the common, and the light and dark shades of chocolate are harmonious and well blended. Another new arrangement of squares and octagons of rather darker tone is shown in No. 609. These tile patterns are only 5s. 6d. per square yard. A very nice design in black and light buff, suitable for Classic buildings, is shown (No. 676), in which elements of the Greek or key-pattern are introduced. The arrangement of border and centre is out of the ordinary run. No. 678 is a peculiar design, which may be termed a brick pattern, of a light and darker shade of red. Some good lobby or vestibule patterns are shown on plate 102. The colouring in patterns No. 626, 627, 628, are of lighter and more subdued shades of red buff and grey than generally seen, and, we think, will wear much better than the stronger and more vivid contrasts. These are suitable for corridors and floors. Charming and brighter patterns are shown in the next plate, many of them showing a nice arrangement of colour, and of more harmonious hues than often met with. Every variety of taste may be met by Messrs. Boote's collection, several plates being devoted to patterns for floor-tiles of every conceivable arrangement and colour, large and small. The delicate tints of wall-tiles, in squares and hexagons and octagons, in duck-greens, buffs, light greys, white and brown, and white and blue, suitable for lavatories, larders, &c., may be noticed; also hearth-tiles and glazed dado and wall-tiles in some very quiet and pretty patterns and colours. The patterns are all drawn to a scale, and the catalogue is accompanied by a price-list. These new encaustic, mosaic, and tile pavements and wall decorations are of moderate price.

The new schools at Ince, near Wigan, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

The York City and County Banking Company, Limited, have just opened a branch bank at Durham. The work necessary for the conversion of the premises into a bank has been satisfactorily carried out by Mr. Thos. Coates, builder, of Durham, from designs and under the superintendence of Mr. H. T. Gradon, A.R.I.B.A., of that city

ARTHUR MARSHALL DELT

WAYSIDE NOTES.

E International Congress on health matters is a fussy gathering. There never was, of , such a "concentration of thought and an interchange of ideas upon sanitary ts" as at the meeting at St. James's Hall nday last, which would have gladdened the of the late Sir Edwin Chadwick. There e Prince of Wales presiding at the opening series of meetings for the discussion of ie, and the columns of the dailies filled chnical dissertations on subjects which, in themselves particularly attractive and g, are yet calculated to as much promote neral weal and benefit the community at as Parliamentary debates or archæological hts.

s true that we are now well in the "big perry season," and that the dailies afore- re glad of copy even if it consist of no more ul subject-matter than microbes, bacteria, e, and slaughter-houses. It is further at in the present congress we are getting but fads from professional faddists, who laid hold of the opportunity to inflict upon persons ideas resulting from local mental gement, from which they themselves suffer. l, editors short of copy probably wink at inter, and console themselves with the idea really big fad goes down nowadays in t as well as an idea—*perhaps better*.

t interesting to architects among the le mass of verbiage have been the addresses iscussions in the section of "Architecture lation to Hygiene," over which Sir Arthur ield presided. Sir Arthur's address itself, abt, contained a great deal of interest and cal service, touching the connection between and beauty and ugliness and disease, but nded very much like a pastoral address.

Earl of Meath still pegs away at the on of open spaces, and brought forth by his on Tuesday a statistical statement from an ling member as to the relative number of iduals to open spaces in several large cities. ndon, leaving out the great parks, there are rsons to an open acre, in Paris 495 persons, nna 473 persons, and in Brussels 637 per- In the Engineering Section it is evident those who have to address the Congress have s one staple article on the bill of fare, and not particularly attractive, except to lists. There is always something to be said the *drainage of London*, and this was the t tackled by Sir John Coode as President Section. One might listen in vain for any practical suggestions on this now leviathan on, which is a foeman worthy of the united hts of a whole Congress. It remains to this nt master of English engineers and ists; nor, considering the diversity of n on the best method of sewage disposal he Metropolis, is the prospect of a really ive solution of the problem very encouraging. two alternative proposals put before the ress by Sir John Coode are the treatment of wage by filtration through land—sewage- , I take it—or its conveyance to the coast d the mouth of the estuary of the Thames.

at appears to be a good competition for eers is that hailing from New South Wales. £700, £300, and £200 contrast well with 15, £10, and £5 offered to the architectural ssion by the Corporation of Luton, who re designs for the alteration of a public hall, seeing that they want the plans by Sept. 8, in some haste to receive them.

respect to the charges against certain dian officials, now being investigated by amentary Committee at Ottawa, a corre- lent writes to the *Pall Mall Gazette* that the dian Public Works Department is "rotten e core," and says: "a striking sample of ay in which contractors have been allowed un' the Public Works Department has been led in connection with the 'Langevin r'—a pile of public offices close to the es of Parliament. The contractor for the nry, &c., was allowed by special clause to a tax on any other contractors who might to work in the same building. This he did e extent of 25 per cent. For instance, a that had agreed to put in heating apparatus, for £3,000, had to pay the first contractor £750 before gaining entrance to the building. Another firm got a contract to put on the roof for £8,600, reckoning to make £1,800 profit; but on their refusal to hand over all their expected profits and more beside to the 'man in possession,' the latter got the contract himself, though his tender was for £12,000." This indicates a bad state of things enough for a Works Department, even if the other charges brought against the officials are unfounded.

Are we going to have a craze for Spanish detail? I trust not; but it is certainly curious that, as you reported last week, so many of the competitors for the new buildings at Kensington have adopted a Spanish treatment. Spanish detail, in only one set of designs, seemed a novelty, and no desirable novelty to my way of thinking; but when I read on and found not one but two, three, and four of the sets of designs described as having Spanish feeling in the details, then I marvelled, for, so far as I can see, the mere necessity for harmonising with existing buildings did not bring about the general adoption of Spanish detail and other features from the architecture of the Peninsula. What, then, is the cause? I did not know that there was so much as a suspicion of a rage for a Spanish mode of treatment in the up-to-date architectural circles; but one is compelled to conclude, from the result of the South Kensington competition, that a mild form of "sub-acute" fever of this kind exists. For my own part, I must say I fail to see the advantage thereof, whatever opinions other parties may hold.

I see, from a note in one of my note-books, that, according to Leeds, the author of "The Orders of Architecture," the Hanover Chapel bases are the only examples in the country of the peculiar base-moulds employed. So this is more than I stated the other day, when I said that they were good examples of this kind. As it is improbable that any further example of this very beautiful variety of the Ionic base has been erected since Leeds wrote, the iconoclasts about to pull down the chapel in Regent-street will be destroying something positively unique. Perhaps they will feel all the more proud of their achievement when they know this. Dreadful, isn't it, in spite of the R.I.B.A. and all its angels, to lose the only real Ionic base in Regent-street?

St. Helen's, Bishopsgate, is about to be restored in the thoroughgoing style, according to the *Athenæum*. Mr. Pearson will be the architect to the restoration. The rector of St. Helen's has issued a circular, in which he states that, if the work is to be properly performed, and in a manner worthy of this renowned church, it will be necessary to raise by subscription a sum of £3,000 over and above the sum allotted by the Charity Commissioners and that contributed by the patrons. The estimate for the reparation and restoration is £7,000, with £3,000 as the probable cost of new fittings and decoratiom. The Charity Commissioners have granted £4,092, and the patrons of the church have subscribed £2,000. This seems a lot of money to be expended on a comparatively small building, and where we hope constant regard will be had to the old architecture, and to historically-valuable features; but then Mr. Pearson has a way of doing things solidly—as, for instance, when he boarded and felted, twice over, the roof of Maidstone Church.

The City Corporation is about to purchase a farm on the edge of Banstead Downs, so that they will have a *locus standi* if any future lord of the manor or other "land-grabbing potentate" should endeavour to inclose pieces of common land for private. This is good. I wish the Corporation would also interest themselves in Hayes Common. I have been in the habit of roaming all over the place for years; but now signs of inclosing appear, the right whereof and title thereto I should like to see in black and white. Some years back, a fine piece of primæval forest, with venerable oaks, wherein I have roamed freely, was inclosed, and houses built, and of late I have noticed that iron railings have been placed round a similar grand piece of apparently public common, with what ultimate views I should be interested in knowing. I much wish attention could be drawn to the latest inclosure of this magnificent tract of common land.

GOTH.

NOTES FROM IPSWICH.

IPSWICH, the chief town of Suffolk, is a very prosperous place. It is putting out its feelers in all directions, and enlarging its borders. The land on all sides is being rapidly taken up for building purposes, and the number of handsome villa residences which already dot the surrounding hills is being constantly added to. Internally, too, the town has undergone great changes and improvements. The business establishments at various points in the main thoroughfare—nearly a mile in length—have been beautified and enlarged. Indeed, at every point there are indications of marked commercial prosperity; so that from the time when a few years ago £250,000 was spent in public improvements, the builders have been more or less busy, and some of them have found it necessary to set their own houses in order. Notably has this been the case with the New-street Works, whose proprietors have in turn during the past century played a very prominent part in the extensive public works and private improvements which have been carried out, especially during the last quarter of the century. This building establishment, which covers an area space of something like an acre, is situated in the oldest part of Ipswich, the rich carving and the grotesque figures which embellish the fronts of many of the old houses in the parish of St. Clement testifying in a way nothing else could do to the standing and prosperity of men who generations ago did good business in this part of the town. New-street is an important thoroughfare as leading from a rising district occupied chiefly by artisans. A good deal of the "newness" of the street disappeared long ago, and strangers must have wondered why it was called "New"-street. Mr. Fred Bennett, the proprietor of the building establishment, which takes its name from the locality in which it is placed, has, however, removed—for a time, at any rate—any reproach which might hitherto have attached to the locality on the score of its want of freshness, seeing that he has taken up about half one side of the street with his new works. But if you would know the extent of the ground covered, and the number and uses of the various buildings, and be interested in the labour-saving appliances to be found here, you must go behind the scenes. There are, indeed, several branch establishments within these four walls. Not only is Mr. Fred Bennett a building contractor, but he is also a plumber, glazier, and painter, an artesian well borer, stonemason, and blacksmith. Each business has a department or store to itself, with, of course, its responsible head.

It is not necessary to trouble the reader with dry details as to the sizes of the different compartments found within the spacious inclosure. The old office which sufficed in 1846 looks very tiny in comparison with the large, lightsome, and well-fitted-up department which is the heart or life-centre of the whole of the business. Of course, there is a private office, which Mr. Fred Bennett has all to himself; then there is the commercial office, whose shelves, by the way, are adorned with a complete set of the BUILDING NEWS; then there is the clerks' office, with telephone adjoining, while the huge fireproof safe has an apartment of its own. The machine-shop has two circular saws, hand-saws, frame-saws, gulleting, planing, thicknessing, and drilling machines, supplied by Mr. Henry Prince, 3, Victoria-street, Westminster. The joiners' shop is a very spacious building, with bench-room for 40 or 50 men, and at all times the scene here is a busy one. This has been provided with mortising machinery, and other adjuncts for expediting joinery work. Leading out of this is a store for ironmongery replete with everything necessary for the builder. The painters' shop is a very roomy compartment, and underneath this is the plumbers' shop, with screw-cutting machines and other necessary appliances. Close by is the well-boring shed, where are well-boring tools with rods for boring to a depth of 1,500ft. By the way, Mr. Fred Bennett makes a speciality of, or rather lays himself out for, well-boring, and of late he has sunk 40 or 50 artesian wells in the neighbourhood, and has done miles of arterial drainage in Ipswich. The blacksmiths' shop is quite of the old-fashioned type, but a steam-blast does efficient duty in the place of bellows. There are bolt and wrought-iron stores, troughing and piping, and block stores, and other convenient stowage places. The masonry department is evidently considered a

highly-important branch of the operations carried on within this inclosure. The yard is completely furnished, so that about a score of masons can work at one and the same time, while by the side of it is a large, well-fitted-up masons' office. Plumbing is also another feature in these works, and attached to this is a handsome drawing office. There is, too, a mortar shed, with a steam mortar mill and engine complete, so that there is no waste of the old mortar which comes to hand in the pulling-down process; but it is re-ground up, and the last condition of the mortar is certainly stronger and better than the first. Mention ought to be made of the stabling, there being stalls for half a score of horses.

Mr. Fred Bennett has a good name in the county, and even far beyond its border, for the excellence of his work, and it is only just to him to say he prides himself upon this. The stored timber bears significant marking to indicate its age, so as to insure good seasoned wood being put into new work. The undertakings with which this firm have been connected are legion; but the more recent include extensive alterations at Euston Park, the Suffolk seat of the Duke of Hamilton, involving an outlay of £14,000; the Ipswich Museum; the Ipswich Free Library; the Ipswich Art Gallery, and other public works.

About 300 men are employed at the New-street Works. Mr. Bennett is the president of the Builders' Association, whose members have arranged with their men in reference to their wages for the next three years. This gentleman is exceedingly popular amongst the workmen of the town, and he enjoys the esteem and confidence of all in his own employ, whose welfare he has closely at heart, one, amongst many other proofs, being afforded by his generous support of the benefit club, which has proved such a valuable help to the men at a time when help is most needed, and, therefore, most appreciated.

HOT-WATER ENGINEERING.—X.

Supply of Hot Water for Baths and Domestic Purposes.

the cylinder system (*continued*).

REFERENCE was made in the last paper to the disadvantages which lead to the less use of large circulating pipes in the tank system, the chief one being the disproportionate increase in cost, both in material and labour, in erection. Large pipes, with certain precautions pointed out, are preferable, so that in the cylinder system we have another advantage in being able to have full-sized services where the deposit occurs without increasing the cost but to a very small extent.

As a rule, the extent of pipe between the boiler and cylinder does not exceed 12ft., with perhaps four bends, four connectors and back nuts, for both services. Under these circumstances a good-sized pipe can generally be afforded—1¼in., or sometimes 1½in.—as we do not get incrusted deposit in any of the other pipes, not even in the beginning of the secondary flow or rising main. If deposit has ever been found in this latter pipe it may be considered an exceedingly rare instance. A thin film may occur, but never sufficient to choke the pipe.

The rising main should be 1in. pipe in moderate and fair-sized works; ¾in. is permissible in small undertakings. It is not a question of the pipe being stopped with deposit that governs the size in this instance, but provision that the overflow of water at the taps may be abundant and not slow, a slow issue of water at a tap causing much annoyance both at the servants' sink and at the lavatories and baths, particularly the latter. A larger pipe than 1in. is not recommended, as no occasion exists for it except in large works: this sized pipe will give a good outflow to two ¾in. taps opened at once. This, however, is further governed by the size of the cold supply, as will be explained directly. The return of the rising main (secondary return) may be ¾in.; it hardly ever need be larger unless draw-off services are taken from it, then it requires to be the same size as the rising main itself as far as the last tap. Past the last tap it may be reduced if the distance to the boiler makes it worth the while. This has already been fully explained.

The draw-off services vary in size, but it may be first mentioned that whether the apparatus be upon the cylinder or tank, or any other system, the size of these pipes and the necessary taps are the same. That is to say, if a 1in. pipe and tap is recommended for the draw-off service to a bath, then this size is suitable whatever system it be connected to. The bath service is usually the largest, as a slow-filling bath is never liked; 1in. pipe should be used for this (assuming the rising main is 1in.), and if it terminates with a tap over the edge of the bath, then the tap should be 1in. also, and have as full a way through it as possible. There is no advantage in using a large draw-off service pipe if the bore of the tap chokes the passage of water. If the pipe is connected to the fittings provided by the bath maker, then no gain is effected by a large pipe if the passage through the fittings be small.

FIG. 31.

Baths are now made in great variety, but the majority of those for moderate and good quality works have fittings attached—that is, the hot and cold water taps and waste attachment are combined in one brass fitting at the foot of the bath, as doubtless every reader knows. The particular objection to many of these fittings is the small passage or way through them, and this is too commonly aggravated by the shape of the outlet causing the body of water which issues to be broken up. Sometimes a deal of the water is ejected like spray. This action cools the heated water, and it also has the objectionable effect of rapidly filling the bathroom with steam—a decided drawback at the best of times. Some of the best bath-makers obviate this latter trouble by having the hot-water inlet near the bottom of the bath (not in the bottom, but in the end), so that when a little water passes into the bath the inlet becomes covered, and steam then, of course, ceases to rise, except a little from the surface of the water which is in the bath. This

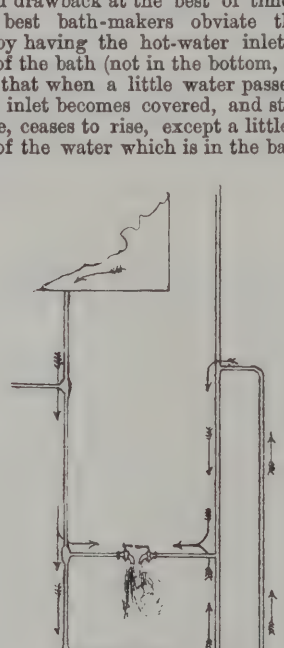

FIG 32

arrangement must not be confused with the old pattern zinc and copper baths which have but one aperture in the bottom, this aperture answering for hot and cold inlet, as well as waste outlet. This old method certainly prevented steam rising as much as the new, and also had the same advantage of filling the path silently, instead of with the otherwise roaring of the outpouring water; but it possessed the particular disadvantage of washing back the soapsuds, &c., of the last bather each time the bath was refilled. The inflowing water would always carry in such matter that would naturally collect in this general outlet and inlet.

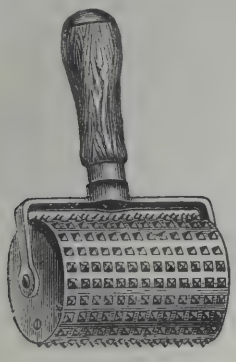
Draw-off services to servants' quarters, scullery, butler's pantry, housemaids' sinks, &c., are almost always ¾in., with ordinary taps. S times the last-named are ½in.; but not i good-sized residence. The other two name rarely less than ¾in., and except in property a smaller tap would cause annoy The butler's pantry sink, which is pro with a cover, generally requires what is ca "horizontal" cock, with the key at the si Fig. 31. There is not generally room for the ordinary upright variety; the handle be in the way of the lid. The emptying below the cylinder should be ¾in., with a keyed cock, as explained; a smaller s would do, but would render the emptying cylinders a very long job.

The cold supply service in the cylinder s is undoubtedly the most important of all the in the apparatus, and it is this pipe that is as an argument against the system in que When the rising main is returned, the supply, which is brought all the way down the house cistern to the cylinder (see illustr in last paper), forms a third pipe extending bottom to top of house, and this is conside disadvantage compared to the tank system, has only two pipes extending thus, and the pipes in cost of material and cost of labour e that of two pipes. It must, however, be po out that the difference is not so great appears at first sight, as the three pipes less size than the two mentioned.

This extra pipe question has received a d attention with a view to doing away with i without lessening the efficiency of the apps and still retaining the advantages of the ret rising main. The general way this has aimed at is by utilising one of the cold- pipes which convey water to the sinks, &c. which, in the ordinary way, are not suppo have any connection with the hot-water paratus. This will answer, to a certain ex As long as the pipe starts from the ciste the top of the house, and terminates at cylinder, it does not materially matter h deviates from a direct route, so long as it is from end to end, and has no obstacle or stop in it. The mere fact of cold-water dra services being in connection with this pipe not interfere with the free supply of water cylinder, except in the following way.

If the cold supply to the cylinder has d off taps connected to it (this is what the arr ment under discussion amounts to), there is result brought about in this way. It is custo at a sink or a bath or lavatory to open both and hot taps together when warm wat needed, and as only one pipe from the cistern feeds or supplies the two taps, it fo that the water will only issue from the t about half the speed that it would do if a sep pipe from the house cistern was devoted to as is the case in a properly-constructed appa This result is particularly unfortunate at a where rapidity of outflow is all-important the hot tap will be found to run very slow passage of the water through the system of impedes the flow still more. It will be fou almost every instance that the water will from the cold taps more freely than from hot, as in the former case the distance in l of pipe is less and more direct. Fig. 32 trates an apparatus in which the cylinder i from one of the house cold-water services. arrows show how the water passes from ciste taps when taps are opened.

There is another disadvantage in utilisin method just explained in the fact that i cold-water taps are situated in this cold s pipe near to the cylinder, hot water will s times be drawn from them—a result that i always pleasant. In the next paper wi described the method most to be recommend obviate the necessity of bringing the cold s pipe down to the cylinder, this method admi of all the advantages sought for.



THE LONDON CARPENTERS' STR

THE Master Builders' Association have week, through their secretary, writt the United Trades Committee, withdrawin terms offered at the recent conference. A r has been circulated that several of the sh South London were reopened on Monday old terms; but this proves, on investigati be without foundation. *Per contra*, five firms, Messrs. Batchelor, Portman-street; Barker, Kensington; and Calnan, Romaines

eckley, have given the advance to 10d. and 47 hours' week. Of the 175 firms struck, 43, ploying 1,500 men, have now conceded the n's terms, and the United Trades Committee being well supported with funds by the pro- cial branches. At present 3,600 men are iving strike pay.

PATENT PAVEMENT ROLLER.

HIS patent brass roller, invented by Mr. Alexander Gilchrist, of 35, Eglinton-street, sgow, is designed to impart the necessary entation or grooving to cement pavements, ich, when in a semi-liquid state, are indented

h this apparatus so as to give them the degree roughness required to prevent people from ping. As this kind of pavement is now coming very much in favour not only in sub- cution for the ordinary York stone for foot- hs, but also for indoor corridors and staircases, ere the smooth cement rapidly becomes pery, Mr. Gilchrist's rollers should come into ensive use. The body of the roller and the th are made in one piece of brass, there being refore no danger of the teeth falling out and uiring to be replaced. Name plates, gutter lers, and stable-pavement rollers, and, in fact, lers of any pattern for the surface ornamenta- n of plaster or stucco, are made by the same ventor.

CHIPS.

The restoration of the tower of Ludlow Parish urch has been completed this week at a cost of ,000. The work has been carried out under the ection of Sir Arthur W. Blomfield by Mr. John ompson, of Peterborough.

A destructive fire occurred on Saturday at the aber-yard of Messrs. F. Appleby and Son, Queen's ck Side, Hull.

The Manchester Corporation, who are demolish- g the 18th-century church of St. Mary for the rpose of widening Deansgate, and providing open space, discussed at their last meeting whether e tower, described by Mr. Waterhouse, R.A., as As fine as anything of the kind in Manchester," ould be retained. The corporation decided to nolish it, the Mayor declaring that the steeple d no architectural beauty, and was only a plain d meaningless obelisk.

Two portions of Roman wall running at right gles, and some Roman bracelets, coins, a spur, d fragments of armour and vases, have been dis- erred during excavations for rebuilding Messrs. msdale's bank in Cornhill.

Mr. William Oxtoby, assistant borough engineer Hull, was elected borough surveyor and inspector nuisances of Beverley, on Monday.

Two windows in the south clerestory of the nave the cathedral of Manchester are about to be filled th stained glass by private donors as memorials.

The picturesque town of St. Ives, Cornwall, is have a new mariners' church, and Mr. Edmund dding, of Plymouth, has been chosen architect. e site is a particularly good one, standing on the vated ground behind the quay.

The Congregational church in Park-crescent, apham, a building erected, in 1847, in the version Early Pointed then fashionable in Dissenting mmunities, is being renovated. The principal çade has been partially rebuilt, the gable lowered nearly 10ft., and a terracotta orb substituted r a decayed stone cross, and all the Bath stone uildings, which had perished through the action the weather, are being cut away from doors and ndows, and all masonry refaced. Mr. Knight, Acre-lane, Brixton, is the contractor.

Building Intelligence.

Dunblane Cathedral.—During the summer months rapid progress has been made with the mason work in the restoration of this cathedral. The choir, which has been the place of worship for many years, has given more anxiety to the restorers than the nave, which has been roofless till now for three centuries. It was found that the tops of the choir wall were more decayed than was expected, and part had to be taken down and rebuilt. This being now finished, the external appearance looks complete. In the south wall of the choir there are six large windows, and the upper part of the tracery of four of these has been altered to correspond more exactly with what is considered the original. The east gable, containing the great east window, has now been flanked on either side by a small turret. Dr. Rowand Anderson, of Edinburgh, is the architect. A full-size drawing of the exterior and a plan of the cathedral, by Mr. J. B. Tyerman, and an interior view by Mr. J. S. Gibson, of Dundee, will be found in the Building News for July 24, 1885. The west front was illustrated from a sketch by Mr. W. Ferguson in our issue of Dec. 14, 1878; an elevation and details of this façade, drawn by Mr. E. F. Clarke, in that of May 20, 1870; and the nave arcade and south aisle, also by Mr. Clarke, in that of Oct. 14, 1870.

Epworth Parish Church, Lincolnshire.—On Bank Holiday, a new public clock, striking the Cambridge chimes on four bells, and the hours on the fine tenor bell of about 27cwt., was started here by the Bishop of Nottingham. The old clock, which was quite worn out, and useless as a timekeeper, was erected just a century ago, to commemorate the event of some of the Wesley family being preserved from a fire at the rectory, the present clock being erected by a public subscription from all denominations. Messrs. Wm. Potts and Sons, clock manufacturers, of Guildford, and Cookridge-street, Leeds, makers of the Cathedral clock, Lincoln, were selected to carry out the necessary work.

Everton, Liverpool.—St. George's Church, Everton, was reopened on Sunday, after internal redecoration. Formerly the church, even on the brightest days, was dark and gloomy in appearance. The main roof and other ceilings are now decorated in vellum tones, and within the quatre and trefoils in deep reds and turquoise blue; the tracery, along with spandrels, arches, and other iron work, is treated in a light cinnamon colour. On the front of the gallery a warm ivory colour, with cinnamon mouldings and a Gothic design in rich red and turquoise blue, are employed. At the west end the great wall space is broken up by bands and Gothic designs, worked out in deep reds, blues, and yellows. The works have been carried out by Messrs. G. H. Morton and Son, decorators, Liverpool, under the personal supervision of Mr. Morton, jun., M.S.A.

Glasgow.—The Athenæum buildings in St. George's-place, only erected three years since, are about to be extended on the site of the Religious Institution Rooms, having an area of 86ft. by 45ft. The hall in the basement is seated as a theatre, with folding chairs, the audience being about equally divided in area and gallery, each part of the house having separate access and independent emergency doors. The smoking room and light luncheon room of the refreshment department may be used in connection with entertainments in the hall. The dining-hall on the first floor, a room with wood-panelled walls, covers the entire site, with the exception of main staircase. The gymnasium, with its dependencies, like the restaurant, covers the entire site, and has an open floor space of 85ft. by 30ft. 6in., of which 60ft. by 30ft. 6in. is 25ft. high, and lighted from the roof. The whole building is to be ventilated by forced draught, and lighted by the electric light. The elevation to Buchanan-street is in sympathy with the design of the original building. The cost of the extension will amount to about £15,000. The architects are Messrs. J. Burnet, Son, and Campbell; the measurers Messrs. J. Dansken and Purdie; and the clerk of works, Mr. Thomas Douglas.

Leamington. — The memorial stone of a gymnasium about to be added to the College, was laid last week. The site adjoins the present racquet-court, and the building will comprise a hall, 75ft. by 35ft., separate dressing-rooms for the upper and lower schools, and lavatories. These latter apartments, however, will be added at some future date. The gymnasium will be built of Leicestershire red bricks with Bath stone facings, and the interior will be lined with red and white bricks. There will be a pitch-pine dado, 5ft. high, running all round the room, and at one end a large gallery will be placed. The roof will be constrcted on the queen-post principle. The estimated cost of the building is £1,300. The contract has been placed in the hands of Mr. R. Bowen, and the architeet is Mr. Hawley Lloyd, both of Leamington.

Rivington.—A chapel is being added to the Grammar School situated at the foot of the Pike at Rivington, as a memorial, and the foundation stone was laid last week. The site adjoins the school-room on the north-west. The plans, as designed by Mr. R. K. Freeman, F.R.I.B.A., of Bolton, shows a building of Gothic character. The chapel, the floor of which is raised some 5ft. above the entrance, will be approached by a flight of steps, and measures 46ft. by 22ft. 6in., the floor of the chancel end being slightly raised. On the right of the chancel is placed a small organ-chamber. The benches, which will be of oak, will run along either side and across one end. The roof is to be carved and boarded, and divided into panels by moulded ribs, whilst a roof principal, with carved beams, will separate the chancel from the nave. The east and west windows are large, and filled with tracery. The roof will be covered with slate, and the floors fireproof and finished in wood blocks, the floor of the chancel being covered with tiling. The materials will be of local stone, similar to those used in the school. The contract for the work has been let to Messrs. Moore Bros., of Rawtenstall.

South Shields.—During the past few weeks the theatre has been closed, and some alterations have been carried out. The bar on the dress-circle floor has been converted into a lady's cloak-room. Two new fireproof staircases have been provided. The ceiling is covered with lincrusta, and divided into panels of geometrical design. The cornices have been stencilled in colours, the friezes being decorated with lincrusta, and picked out in colours. The fronts of the gallery and dress-circle have been altered, and decorated. The panels are filled in with Tynecastle tapestry, relieved with foliage and figures. The whole of the interior has been reupholstered and redecorated. The structural alterations have been carried out by Messrs. H. Brown and Co., of Newcastle; and the painting and decorations by Mr. G. G. Laidler, of the same city. The work has been carried out under the superintendence and from the designs of Mr. J. H. Morton, of South Shields.

Woodhouse, Leeds.—A building to be known as the March Institute is being erected in connection with St. Mark's Church and Schools, Woodhouse Moor. On the ground floor there will be a reading-room 28ft. by 18ft.; a recreatiod room 28ft. by 20ft.; a small lecture-room, 31ft. by 23ft.; a tea-room, committee-room, lavatories, cloak-room, &c., together with apartments for the caretaker. On the first floor there will be a large lecture-room, 70ft. by 39ft. 6in. This room will be approached by two separate staircases, and have a large platform at one end, near to which will be a small committee-room. There will also be a second tea-room on this floor. In the basement will be the heating apparatus-room and a large covered playground. The latter will be lined throughout with white glazed bricks; and owing to the natural fall of the site, it will be above ground at the back. The building is to be of red pressed bricks with Bradford stone dressings. The windows in the two principal elevations will have moulded jambs, transomes, and mullions. In the west elevation, which is gabled, are to be two oriel windows of stone, with moulded jambs, mullions, and transomes, and embattled cornices. The gabler above these windows will be filled with diaper brickwork. The windows on the first floor will be gabled. The lecture-room will accommodate 600 persons, and have an open roof with hammer-beam bindings. The windows internally will have quoined stone jambs and mullions, and be filled in with cathedral glass in lead-work. There will be a framed panelled and moulded dado, with a moulded and embattled cornice. The whole of the internal woodwork will be stained and varnished. Messrs. Smith and Tweedale, of South-parade, are the architects, and Mr. Thomas Hannen is the contractor

COMPETITIONS.

Glasgow Art Gallery.—The executive committee of the Association for the Promotion of Art and Music in Glasgow met in Hutcheson's Buildings on Friday. The secretary announced that the minimum of £46,000, which was required before the contract with the Corporation became operative, had been subscribed by 43 people. The executive resolved that there should be a double competition with the view of obtaining a suitable design for the new galleries. In the first place they will ask all architects who choose to do so to compete, and from among the competitors at least five will be selected, and they will be invited to send in complete plans and drawings, one of which will be selected. Mr. Alfred Waterhouse, R.A., was appointed assessor to guide the committee in the various steps they have to take in framing instructions for the competition, and in finally selecting a plan. It was also remitted to Mr. Waterhouse, along with Mr. Macdonald, city engineer, and Mr. Paton, curator of the Corporation Galleries, to adjust, on the basis of the report approved, the conditions of the competition and the instructions to the architects. These will be printed and submitted to a meeting of the executive to be held on Monday, Aug. 24, so that advertisements can appear in the architectural journals on Aug. 29, inviting competition plans, which it was arranged should be sent in early in November. It is expected that building operations will be commenced in April next, and that the foundation-stone will be laid in August next.

Manchester.—At the last meeting of the city council it was decided to award the premiums offered for the best designs for artisans' dwellings as follows:—Oldham-road area: First premium, £100, Messrs. Spalding and Cross, Queen-street, Cheapside, London, whose plans were signed "Practical"; second premium, £50, Mr. W. R. Sharp, 13, Exchange-arcade, Manchester, for designs signed "Simplex"; the third premium of £25 was awarded to Messrs. Gibson and Russell, Old Bond-street, London, whose plans were signed "All things considered." Pollard-street area: First premium, £30, awarded to Messrs. Spalding and Cross; second premium, £20, awarded to Mr. T. L. Worthington, Queen Anne's-gate, London.

New York.—The Trustees of the Cathedral Church of St. John the Divine have decided to place the erection of their building in the hands of Messrs. Heins and La Farge, of New York. We illustrated their selected design, together with those of the other three competitors, in our issue of the 3rd April last. It is an adaptation of Romanesque details to Middle Pointed outlines, of the class popularised in the Eastern States by the late H. H. Richardson, of Boston, and shows a nave with lofty clerestory and low aisles, apsidal-ended choir with chevet of chapels beyond, transepts, and round-ended morning chapel on south side; in the centre is a huge pinnacled tower capped with a broad spire, and the west end is flanked by a comparatively unimportant tower and spire on either side. The cathedral is to be built on Washington Heights, at a cost of nearly a million sterling, and Messrs. Heins and La Farge's design has been chosen in a second and final competition, for which only four designs were sent in.

The Grand Theatre and Opera House at Stockton, which has recently changed hands, was opened on Monday. The building has been entirely remodelled by Mr. Frank Matcham, of London, whose plans have been carried out under the direction of Mr. C. Moses, of North Ormesby.

In our notes anent Victoria Law Courts, Birmingham, we mentioned "radiators" as being used for warming, but we omitted to say that they are of the "Sunbeam" pattern, which are manufactured by Messrs Longden and Co., of London and Sheffield. The following list of places at present in hand, and recently warmed with these radiators, is strong evidence of their popularity:—Royal Infirmary, Liverpool; Royal Hospital for Consumption, Ventnor; Assize Courts, Nottingham; Epidemic Hospital, Nottingham; National Provincial Bank of England, London; National Provincial Bank of England, Manchester; National Provincial Bank of England, Middlesbrough; National Provincial Bank of England, Cardiff; Town Hall, Birmingham; Guildhall, Gloucester; Coates Memorial Church, Paisley; the Camera Club, London; Messrs. Pears, New Oxford-street, London; Messrs. Tiffany and Co., Regent-street, London—in addition to a large number of private residences.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Manchester Architectural Association.—On Saturday, the 8th inst., about 40 members and friends visited the Jesse Haworth Memorial Church, recently built at Walshaw, near Bury, in Lancashire. Its exceptional features are the thoroughness with which every part of the structure has been carried out in the most durable materials, and the large amount of memorial glass of excellent quality by which the interior is adorned. The church was designed by Mr. L. Booth, F.R.I.B.A., and has been carried into execution under the supervision of Messrs. Booth and Chadwick, of Manchester.

Royal Archæological Institute. — This Institute opened its annual meetings in Edinburgh on Tuesday. At noon there was a reception of the members in the National Portrait Gallery by the president and council of the Society of Antiquaries of Scotland. The inaugural meeting took place in the lecture hall of the Royal Geographical Society, when Earl Percy, the retiring president of the institute, introduced his successor in office, Sir Herbert Maxwell, who, in his opening address, vindicated the claims of archæology to respect as the handmaiden of anthropology and history. In the afternoon the members visited Holyrood Palace under the guidance of Mr. W. Wyham, of H.M. Board of Works. In the evening the antiquarian section was opened with an address by Dr. John Evans, the chairman. A striking feature of the congress is the exhibition of the Society of Antiquaries, in the National Portrait Gallery buildings, of a collection of rubbings of sculptured monuments from various parts of Scotland by Miss Maclagan, of Ravenscroft, Stirling, a lady Associate of the Society. The collection consists of upwards of 400 rubbings mounted on 271 sheets, the largest of which is 10ft. square. No collection at all approaching this one in extent, variety, and effectiveness has ever before been made in Scotland. On Wednesday the Royal Archæological Society visited Linlithgow, and inspected St. Michael's Church and the palace. They afterwards proceeded to Stirling, and visited the castle, the East and West Churches, and other places of historic interest. In the evening Dr. T. Hodgkin opened the historical section in the National Portrait Gallery, Edinburgh, with an address on "The Relation of History to Archæology." Mr. Louis Dyer, delegate from the Archæological Institute of America, read "Notes on the Vitruvian Account of the Greek Stage."

ARCHÆOLOGICAL.

Lincoln.—The remains of a Roman villa have just been laid bare by the miners employed at the Mid-Lincolnshire Ironstone Company's works at Lincoln. From time to time extensive basement floors in tesselated pavement have been laid bare, and from tentative explorations which have just been made still more floors remain to be uncovered. One of these patches of pavements just discovered extends 48 yards northward from the main building, which had previously been broken up. The strip is 13ft. in breadth, and down its centre is a key pattern worked in blue tesseræ. On each side of this runs alternately broad ribbons of white and narrower ribbons of red tesseræ. There is another strip of pavement to the south of the above patch, which has been laid bare to the extent of 27 yards. This piece is 10ft. wide, and its western portion is cut up in patterns indicating the floors of rooms. It is evident that, from the eastern extremity of these floors, another long strip of 48 or 50 yards still remains to be uncovered. All the floors are no deeper than from 18in. to 30in. below the surface of the soil. Mr. Ramsden, the manager of the works, is keeping a coloured plan of the whole of the pavement.

Discovery of Roman Remains at Twyford, Hants.—Some interesting discoveries have been made during the last week in the course of excavations for a new house which is being built for Mr. E. Shenton, under the superintendence of Mr. B. D. Cancellor, architect, of Winchester. About a month ago a passage paved with small red tiles was discovered about 2ft. 6in. below the surface of the ground. This was 6ft. in width, and was uncovered to a length of some 14ft. or 15ft., and probably extends for some considerable distance further. The more recent excavations are some 20ft. to 30ft. west of this, and there have been discovered two chambers, evidently specimens of the ancient bath; one of th is about 8ft. by 6ft., and is paved with red ti Along one side of the pavement is a sunk char leading to an opening in the end wall for escape of water; along the other side is a ra ledge extending the whole length of chamber. The second chamber is 5ft. 3ft. 6in. (internal measurement), and aro its sides and under the paving are sp and flues for the circulation of hot air. floor of this is only 4ft. below the sur of the ground. The walls of both these cham are covered with a reddish plaster about 1 in thickness. To the east of, and between, th two chambers is a furnace with eight kiln- openings, and all in an excellent state of pre vation. The openings are 1ft. 6in. wide, 2ft. in height, and 2ft. in depth. The openings separated from one another by 18in. brick pi There is also a pavement extending eastward the first chamber, about 4ft. in width and above the level of the floor of the chamber. T is paved with square red tiles. Numerous fi and bits of broken tile were found in the cou of the excavation; also various kinds of bor horns, teeth, and ornaments, but very few coi It is probable that an alteration in the plans the new buildings will be made, so that the m interesting features of these discoveries may inclosed in the basement. Plans and measu drawings of the newly-discovered remains by Mr. B. D. Cancellor, the architect for new work.

CHIPS.

Foundation stones of a new Primitive Metho Chapel were laid at Christon Bank, Northumb land, last week. Mr. George Reavell, jun. the architect, and the contractors are Messrs. Fordy and Sons, of North Sunderland, for masor and Mr. Charles Nettleship, of Alnwick, for ot trades. The chapel will be Gothic in style, and seat 130 persons.

The foundation-stone of a Free Presbyter church was laid at Lamlash, N.B., last week. James Hamilton, of Glasgow, is the architect, Mr. John Boyd, of Ardrossan, the contractor masonry. The style will be Early English.

At the instance of the Ayrshire and Wigto shire Archæological Association, a series of exca tions is at present being conducted in the vicinit the tower that in olden days formed part of Church of St. John the Baptist, the parish chu of Ayr. In 1726 the walls of the church pro were demolished to build the steeple of the T booth, which, after standing for almost exact century, was itself removed to widen the str The floor and foundations have been uncove revealing the plan, and many carved stones, cluding a lidless stone coffin, have been found.

A report by the general manager to the Stock and Middlesbrough Joint Water Board, just issu states that the works in connection with the g gravitation scheme, which will cost over a mill sterling, are so far advanced, that Hury reser may be filled in December next.

The Skipton local board, at a special meet held on Friday, passed a resolution asking e ratepayers to sanction the promotion of a Bil Parliament to construct waterworks capable holding 110 million gallons, at an estimated cos £40,000. The scheme adopted provides fo supply from Skibeden, in accordance with a re prepared by Mr. G. H. Hill, M.I.C.E., of Sto port.

A new artificial harbour has just been compl at Leiscoes, near Oporto. The plans have b prepared by Senor Nogueira Soares, a Portugu engineer, and have been carried out by M Dauderni, Duparchy, and Co., for a little under million sterling. The port has been formed connecting some rocks and islets with the shore jetties, and the depth of water is 23ft.

A builder in Chelsea, named Kellaway, brou an action against a firm of solicitors named Bi He claimed £100,000 as damages occasioned to by following the defendant's advice, and allow himself to be made a bankrupt when there was necessity for his so doing. The defendants app to a Master and to Mr. Justice Charles to dis the action as frivolous. Both these authori decided against Messrs. Bury, who appealed, on Friday Justices Denman and Williams allo the appeal.

A new organ, presented to Lilleshall Church the Marchioness of Stafford, in memory of father, the late Earl of Rosslyn, was dedicated Wednesday week by the Archbishop of York. organ is an instrument by Messrs. Abbot and Sm of Leeds.

TO CORRESPONDENTS.

do not hold ourselves responsible for the opinions of correspondents. All communications should be wn up as briefly as possible, as there are many mants upon the space allotted to correspondents.]

is particularly requested that all drawings and all unications respecting illustrations or literary matter d be addressed to the EDITOR of the BUILDING s, 332, Strand, W.C., and not to members of the by name. Delay is not unfrequently otherwise d. All drawings and other communications are at contributors' risks, and the Editor will not rtake to pay for, or be liable for, unsought contribu-

eques and Post-office Orders to be made payable to ASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

e Pound per annum (post free) to any part of the ed Kingdom; for Canada, Nova Scotia, and the United es, £1 6s. 0d. (or 6dols. 30c. gold). To France or ium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), 3s. 4d. To any of the Australian Colonies or New and, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

e charge for Competition and Contract Advertise-s, Public Companies, and all official advertisements per line of Eight words, the first line counting as the minimum charge being 5s. for four lines.

e charge for Auctions, Land Sales, and Miscellaneous Trade Advertisements (except Situation advertise-s) is 6d. per line of eight words (the first line ting as two), the minimum charge being 4s. 6d. for ords. Special terms for series of more than six tions can be ascertained on application to the Pub-r.

ont Page Advertisements 2s. per line, and Paragraph rtisements 1s. per line. No front page or paragraph rtisement inserted for less than 5s.

SITUATIONS.

Correspondence.

ENGLAND THE PIONEER HOUSE-MOVER OF THE WORLD.

To the Editor of the BUILDING NEWS.

SIR,—Mr. W. Worby Beaumont, M.Inst.C.E., tes me saying that until he read your article p. 67 he claimed that his grandfather, Mr. n. Worby, general manager of the Orwell rks, Ipswich, was, in 1848, the pioneer of the ld in moving brick houses, see p. 393, Vol. . England may, however, claim to be the t to move a stone lighthouse—i.e., at Sunder-l in 1841 (p. 393); also see *Proceedings* t.C.E., 1844, Vol. III. p. 342.

England may also claim to be the first mover a building—viz., in Throgmorton-street, City, he 16th century—p. 69 of present vol.

England may also claim to have moved the est house—i.e., Trinity House, Worcester, lt over 400 years ago—p. 69. So that after the fuss about house-moving that has been e in America, England has set the premier mple to all the world in house-moving.

Let the Benchers of Lincoln's Inn move back ir old gateway, and thus not only preserve it a relic, but also remove an obstruction to estrian traffic in Chancery-lane, and England l then be the first in the world to move one of oldest solid brick buildings, of the time of ng Charles and Ben Jonson, of great historic erest.—I am, &c., ALEX. BLACK.

P.S.—Mr. Beaumont sends a plan of the house ved in 1848. It was 28ft. by 32ft., and 21ft. h from ground level to roof plate, and weighed h furniture about 160 tons. His grandfather l him that the removal cost less than half the t of the rebuilding. Neither furniture, ckeryware, nor inmates were disturbed in the oval.

Intercommunication.

QUESTIONS.

[10599.]—**Hot-water Engineering**.—With reference to paragraph 7 of article 8 which appeared on July 31, 1891, and to previous illustrations on this subject, I shoul be very glad to learn why the cold supply should not be attached to the primary return-pipe from the hot-water cylinder on its way to the boiler, the cold supply being dipped previous to its connection to the primary return, instead of the cold supply being attached to the cylinders, as shown on pages 137 and 138, and previously? —G. C. B.

[10600.]—**Competitions.**—Can any reader give a precedent for an action taken by competitors against a board for not complying with the conditions of an advertised competition, and also who would be the best counsel to go to for an opinion?—A SUFFERER.

[10601.]—**Rendering Oaken Walnut Incombustible.**—Can any of your readers kindly inform me whether natural wood—oak or walnut—can be rendered non-combustible, without destroying its nature or appearance?—P. S.

[10602.]—**Fan-Tracery Vaulting**—Will a kind reader recommend a book wherein I shall find good examples of the method of setting out and drawing of fan-tracery vaulting, for which I should feel obliged.—STUDENT.

[10603.]—**Size of Sewer.**—I shall be obliged if any of your readers will kindly give me a formula for calculating the size of a sewer required, the quantity of water to be discharged and the inclination attainable being the only factors given.—A. C. J.

REPLIES.

[10590.]—**Triforium.**—Triforium, probably from "transforium" (transforo, to pierce), that is, "a part of building pierced across by holes or doorways," so as to form a passage. The Italian word "traforo," a tunnel, supports this view of the derivation of triforium. In the French, "trans" becomes "tré," as in trépasser—to die. Possibly, in Latin, "trivium," a cross road, should be derived from "trans," and not from "ter" and via.—A. H. D. C.

CHIPS.

The restoration of the chancel of the parish church of St. Austell is about to be commenced under the direction of Mr. G. H. Fellowes Prynne, of Plymouth and London. An oak chancel arch with supporting angels will be added. The roof is to be decorated, and the east wall over the reredos is to be painted by Fouracre and Sons, of Stonehouse, as a memorial to the late Mr. John Coode, for many years the county treasurer. Several parts of the sacred edifice have been restored and carved by Mr. Doney, a local sculptor.

Sherburn Hospital, co. Durham, is about to be enlarged from plans by Mr. C. Hodgson Fowler, F.S.A., of Durham city.

The Gewerbe-Museum of Berlin has become the purchaser of the great stained-glass windows recently discovered by accident in Leipsic, and originally belonging to the convent of Lindau in Nuremberg. The design of these windows, which are perhaps the finest specimens of German glass-painting in the first years of the 16th century, is, with some probability, attributable to Albert Dürer himself. Among the chief subjects represented, are—The Trinity adored by Angels, the Patrician Landaue kneeling in prayer, the favourite Nuremberg subject—the parable of the Wise and Foolish Virgins—the Fall of Satan, and the Sacrifice of Abraham.

Six colossal lions and griffins, intended to decorate the chief façade of the new Municipal Buildings in Bombay, were sent off from Exeter last week by Mr. Harry Hems, who is executing all the sculpture and carving on this important edifice, which is being erected from the designs of Mr. F. W. Stevens, of Bombay, and was illustrated in our issue of Nov. 7, 1880, and the 19th June last. The animals just exported are each over 8ft. high, and carved out of blocks of stone weighing between six and seven tons apiece. A stone statue of a female figure, emblematic of Bombay, is being carved by Mr. Hems, and will crown the highest gable.

The latest addition to the National Gallery is hung in Room X. on a screen, and numbered 1332. It is a supposed portrait of George, first Earl of Berkeley, by Caspar Netscher (1639-84), presented by Lord Saville. The head exhibits the small, pencilled moustache and huge curled wig of the period, and is painted on the small scale affected by the artist.

The corner stone of new kennels, which are being erected on the Scorrier estate for the Fourburrow hounds, was laid on Tuesday week by Miss K. Foster, of Truro. The contractor is Mr. John Collins, of Stithians.

Mr. Henry Irving has consented to unveil the monument to the poet Marlowe, at Canterbury, which has been executed by Mr. E. Durlon Ford, A.R.A. The ceremony is to take place on the 16th of September.

LEGAL INTELLIGENCE.

A CONTRACTOR'S CLAIM.—MORRIS v. BAYLEY AND MOORE.—At the Notts Assizes last week this case was tried. The plaintiff is a builder at Daybrook, and the defendants are trustees under the will of the late Thomas Bayley. The action was to recover £452 9s. 1d., being the balance of a contract for building eight cottages at Giltbrook, and for extras. The amount in dispute was £163 13s. 7d., the main question being whether the sum of £452 9s. 1d. fixed by the plaintiff was right, or whether £288 15s. 6d. mentioned by the defendants was correct. In March, 1890, Mr. Harriman, architect, supplied the plaintiff with plans for four cottages to be built for the defendants. The price tendered by Morris, £540, was accepted, but before the work was commenced he was asked if he would build eight cottages for £1,000. He agreed to do so, and the work was begun on the 15th of May, the contract being signed on the 3rd of June. The contract price of £1,000 had been paid, and the dispute was as to the amount of extras to be charged. Before evidence was called it was decided to refer the case to arbitration, and the judge decided that under the circumstances the plaintiff was entitled to sue on a *quantuam meruit*. He referred the matter to some person to be agreed upon, or, in case of difference of opinion, to some person named by himself, the costs of the action to abide the result.

IN RE J. DAVISON.—The Birkenhead Bankruptcy Court on Wednesday week adjourned till the 30th September the proceedings in the matter of John Davison, an Oxton builder, and a member of the Birkenhead town council, who recently disappeared and has since written from the Continent. The Official Receiver stated that the debtor had left his wife and four children destitute, although he was understood to have taken plenty of money away with him. His estate would not yield 20s. in the pound, nor anything like it; and if he did not return and give assistance in realising the estate, steps would be taken to bring him back.

IN RE GEORGE VEALE.—An application was made to Mr. Registrar Linklater on Tuesday by George Veale, a builder and contractor, carrying on business in Palatine-road, Stoke Newington, for an order of discharge. The failure occurred in November, 1889, the liabilities being returned in the statement of affairs at £3,587, and the trustee (Mr. C. J. Singleton) certified that the assets had realised £189; but that after making provision for preferential claims there would be nothing available for dividend. The evidence, and the report of the official receiver, showed that the bankrupt began business about 1879 in Leconfield-road, Highbury, with capital to a small amount. In July, 1880, he presented a petition to the Court for the liquidation of his affairs, with liabilities amounting to £2,385, and the creditors accepted a composition of 3s. in the pound. In November, 1882, the bankrupt filed a second liquidation petition, and his creditors agreed to accept a composition of 2s. 6d. in the pound on debts returned at £1,667. He subsequently continued his business at Leconfield-road until some time in the year 1888, when he removed it to Palatine-road, Stoke Newington. He attributed his present failure and the deficiency on his trading to losses on contracts and by bad debts, and to various other causes. The Official Receiver opposed the application by reason of the former insolvencies, and on the further grounds that the bankrupt had omitted to keep proper books, and that he had continued to trade after knowing himself to be insolvent. It was also submitted that he had failed to satisfactorily account for the disposition of various sums shortly before the issue of the receiving order. Mr. Registrar Linklater suspended the discharge for six years from February, 1890.

STAINED GLASS.

BOGNOR.—St. John's Church, Bognor, has just been enriched by the addition of a stained-glass window erected, by his three sisters, to the memory of the late Mr. Thomas Robinson, formerly of Bognor, the subject selected being Christ Blessing Little Children. The window, which has been carried out from designs of Mr. C. E. Savory, M.S.A., represents our Lord as standing in the act of blessing a little child held out to Him in its mother's arms.

ST. SAMPSON'S CHURCH, GUERNSEY.—A stained-glass window has just been placed in the above church in memory of the late Mr. John A. Lainé, of La Maison de Haut, and of his wife, being the gift of their two sons. It is a two-light lancet-headed window, containing two figures, the B.V.M. and St. John Evangelist. Both colouring and drawing are excellent, the style being of the 14th century. The work has been designed by Mr. Oswald Fleuss, 1, Elm-grove, Hammersmith, W.

The town council of Southport have raised the salary of the borough surveyor, Mr. Crabtree, from £350 to £400 per annum.

Our Office Table.

A SPECIAL meeting of the members of the Royal Scottish Academy was held on Saturday, Mr. John Hutchison, treasurer, in the chair, for the purpose of electing a President in succession to the late Sir W. Fettes Douglas. Mr. George Reid, R.S.A., was unanimously elected. Mr. Reid, who is a native of Aberdeen, is fifty years of age, and has been regarded for several years as the foremost portrait painter in the Scottish Academy. In the town-hall of Aberdeen there are portraits from his brush of Provosts Thomson and Sir Alexander Anderson, and of the late town clerk, Mr. John Angus. In the old Parliament Hall at Edinburgh are portraits by him of Lord President Inglis and Lord Moncrieff. The Council Chamber of Edinburgh is adorned with a portrait of the late Duncan M'Laren, by Mr. Reid; and he has painted, also full length, for the Scottish Widows' Fund offices, Mr. John Mackenzie, and for the County Buildings of Kirkcudbright, Mr. Maxwell of Munches. A half-length of his immediate predecessor in the chair hangs in the library of the Academy. As a landscapist with Dutch sympathies, he also holds a high place. Chief among Mr. Reid's figure pictures is "The Death of Savonarola," which hangs in the Art Gallery of Aberdeen. As a painter of roses he has few equals.

MR. THOMAS COOKE FOSTER, for many years connected with the staff of the *Weekly Times and Echo*, expired suddenly on Wednesday week while seated in the Adelphi Theatre, to which some years ago he was officially attached as private secretary to the Messrs. Gatti. Mr. Foster, who was 78 years of age, commenced life as an architect, and was articled at Nottingham. He came to London more than forty years ago, but subsequently abandoned the profession. He was formerly in the office of the *Illustrated News*, and subsequently in the United States for some time in the interest of that journal. His connection with the *Weekly Times* dates from 1863, prior to which year he filled engagements at Drury Lane, the Lyceum, and other Metropolitan theatres.

SIR J. W. ELLIS, M.P., has prepared a scheme with accompanying plans and sketches for widening Wellington-street and Waterloo Bridge between the Strand and the outer or water-side of the Embankment, with spur roads running east and west from the bridge down to the level of the Embankment itself. He points out that the great difficulty of dealing with the Embankment as a means of transit has been its approach from the centre of the Strand. Sir John Ellis proposes that a double spur be thrown out on the south side of the Embankment, encroaching on the water-way of the Thames, and gradually extending from a width 60ft. at the commencement of the widening near Charing Cross and the Temple piers, to 120ft. at its junction with the bridge at the first pier over the stream. These approaches would rise by a gradient of 1 in 33 to the level of the bridge, and at the same time Wellington-street would be widened from the bridge to the Strand to 90ft. by taking in the forecourts in Lancaster-place and setting back the shops on the western side, while the eastern angle next the Strand, now occupied by Messrs. Sotheran's premises, would be canted off. Wellington-street being thus improved, the Embankment approaches would be the means of reducing the traffic which might be expected to pass along the road from Catherine-street, Strand, to Southampton-row, recommended to be constructed by the County Council by the report shelved by a single vote at their last meeting. Sir J. Ellis suggests also that the island between the churches of St. Mary-le-Strand and St. Clement Danes need not be entirely removed, as it would give an unmanageably wide road, but might be rebuilt on narrower lines; but it would be difficult to lay out so narrow a strip as that which would be left to advantage. The whole block must, sooner or later, go.

MR. FRANK J. CHAMBERS, F.R.I.B.A., of College-hill, E.C., writes that last week, workmen, while digging for a drain in a yard adjoining East Paul's Wharf, Upper Thames-street, in knocking away some brickwork they made a small opening into what proved to be a subterranean passage. The tunnel commenced about 50ft. from the river Thames, and extended in a northerly direction for a distance of 110ft., the width being 14ft., and the height 8ft. The ends had apparently been bricked up at a more recent date. From all parts of the arched roof hung stalactites, in some cases a yard long. The floor was of mud. The old house on the river bank standing partly over this vault is said to be 300 years old, and to have been occupied by James I., the adjoining wharf still standing being used as barracks for his soldiers. It is evident that Mr. Chambers's "tunnel" is really the Laystall, which conveyed the sewage of the City in Elizabethan days to the Thames at Puddle-wharf.

MESSRS. ROBERT BOYLE AND SON have reprinted our descriptive articles of Mr. Robert Boyle's "Sanitary Crusade through South Africa," which appeared in our issues of June 26 and July 3, in a very beautiful little volume of pleasantly-tinted gold-edged pages, with some excellently executed illustrations, and bound in a charming serpent-guarded cover. It may probably strike many who procure this unaffectedly-written record of yeoman service done in the cause of sanitation that, apart from all business considerations, which, of course, legitimately and so successfully lend an impetus to Mr. Boyle's efforts, the palm rests rather with the ever-busy champion of hygiene in the dark places of the world than with the kid-gloved advocates of sanitary science who assemble to read pretty papers to princes and the ladies at ambitiously entitled congresses. We notice, by the way, that an interleaved addition bears witness to the unanimity with which the principal journals interested have echoed our recent condemnation of the dirty trick by which certain ill-disposed and envious persons sought to appropriate the fruits of the well deserved success Mr. Boyle has won for the firm of which he is the head.

A CONCRETE SEWER has been constructed at Mount Vernon, N.Y. As part of the line of excavation was through rock, it was decided that the sewer should have a concrete channel, with an arch of stone. Mr. W. E. Worthen, the engineer, describes the plan of construction in the *Transactions* of the American Society of Civil Engineers. The invert channel is formed by a section of vitrified pipe bedded in cement mortar on the rock or on concrete to the proper grade. On this an invert centre is placed, and concrete of 1 of Rosendale cement and 2 of sand and 4 of broken rock is rammed round the sides of the channel. After the concrete was set, the invert centre is removed and the face of the concrete is struck with a thin coat of Portland cement, well trowelled on about $\frac{1}{4}$in. thickness. A $\perp$ plumb, the base fitting the opening of channel, is placed so as to be vertical. A number of holes marked on the vertical piece give centres for describing the arch, which was 2ft. radius, and this radius, by a string or rod, was applied at different centres till one was found best adapted to the rock cut. The section of the sewer is illustrated, which is a rough egg-shape, with straight invert sides and circular arch crown. Economy was effected by this mode of construction.

THE Mayor of New York has propounded a fresh scheme for providing a site for the new city hall and other public offices, which are greatly needed there. Various plans have been devised for municipal offices, and two competitions have been held, with very small satisfaction to the architects who engaged in them; but nearly all the schemes, so far, have contemplated the placing of the new building on the City-hall Park. The park is small, and would be reduced, by the addition of another large building to those already there, almost to nothing, so that the citizens have protested successfully against the adoption of any of the plans. A proposition for taking a tract of land on Broadway failed on account of the enormous expense involved. Mayor Grant proposes that the mass of scattered buildings which now occupies portions of the park, including the old City-hall, the new Court-house, built twenty years ago, at a cost of a million and a half sterling, the Record Office, and engine-house shall be swept away, leaving a clear site, in the middle of which shall be erected a single structure, inclosing a quadrangle, and accommodating all the city and county offices now scattered through several buildings. He shows that all the room needed can be obtained in a building which will cover only 3,600sq.ft. more than the separate buildings into which the same services are now inconveniently crowded. Should this pr be adopted, the third competition with years for municipal buildings will proba instituted in New York.

CHIPS.

At a meeting of the Redditch local board, h the 11th inst., Mr. J. Favell Thorrold w pointed surveyor and inspector in the place S. Elgar Thorrold, who has resigned office the board.

The Yeovil board of guardians, acting rural sanitary authority, have instructed Bailey Denton, Son, and North, of Palace Cha Westminster, to advise upon the sewera sewage disposal of Martock and Ash, in S setshire.

The late Dr. Beaney, of Melbourne, who native of Canterbury, has left £10,000 to the and Corporation of Canterbury for the pur founding a free library, to be known as Beaney Institute for the Education of W Men," and £2,200 to the Dean and Cha Canterbury Cathedral on condition that a ta erected in an aisle to the memory of the testa

At the London County Sessions on Wedn Alfred Anslow, a carpenter, pleaded guilt charge of intimidation towards two other wor to prevent them following their employme offence arising out of a strike. Sir Peter observing that such conduct was an attack liberty of the subject, and was opposed t sentenced the prisoner to five weeks' hard lab

Considerable alterations have been made Camberwell Workhouse, London, embracin ventilation, which is now carried out on the system, the latest improved form of the paten acting air-pump ventilator being adopted f extraction of the vitiated air.

The fine new baths erected at Broughton ford, on a piece of land bounded by Great C street, Mauriel-street, and Lucy-street, wer mally opened on the 5th inst. by the Ma Salford. The baths are from a design by Mangnall and Littlewoods, of Manchester. R. Neill and Sons had the general contract f erection of the baths, the plumbing has been by Messrs. W. Harrison and Sons, and the steam service, and fittings have been furnish Messrs. T. Bradford and Co.

Mr. Isaac Booth, architect and survey Norfolk-place, Halifax, died last week at vanced age.

An appeal is being made for £779 to cl accounts in connection with the restoration Michael's, Coventry. The circular issued nection with the appeal states that the w restoring the church has at length been fully pleted at a total cost of £39,014. Payment been made to the amount of £33,077, leaving of £5,937 still due to the contractor and arc Mr. J. Thompson and Mr. J. O. Scott; and are, besides, a few small accounts owing of sa making a total of indebtedness of £5,967. M this has been raised, leaving the small balanc asked for.

The principal stone of the new Ruthin Gra School was laid on Tuesday in the Mold-ros central tower will contain the principal entra the school building proper, which consists spacious hall on the right, and on the left a se class-rooms, one of which will be used as master's class-room and library, and anothe laboratory. There will be accommodation boarders, and also 120 day boys. Mr. T Browne, Chester, is the contractor for the wh the work.

A public meeting was held at Mevagissey, wall, last week, to hear a statement from Mr. Williams, chairman of the Harbour Commissi with reference to the proposed new pier. Williams explained that Mr. Inglis, the en had prepared a report stating that the restoring the pier, which was partially dem by the blizzard in March last, would amou £11,000. It was useless to expend so large in an attempt to patch up the old pier. accordingly invited the firm of Sir John Co make a survey, prepare plans, and submit estimate for an entirely new structure, and they had mitted an estimate for work amounting to £3000 The Loan Commissioners would sanction a lo condition that a new scale of tolls was agreed the fishermen and others interested. Resolu were passed adopting the plans and agreeing new tolls.

The police commissioners of Lockerbie, have just acquired the local gasworks, estab in 1854, at a price, as fixed by the arbitrator Robert Mitchell, of Edinburgh, and Mr. Ja McGilchrist, of Edinburgh), of £4,880, or e double the nominal capital of the existin company.

HYGIENIC CONSTRUCTION.

ALKING the papers read at the recent Congress of Hygiene, of which we ve given abstracts, so far, at least, as they te to architecture, apparently very little been added to our knowledge of sanitary truction. Some of the more valuable estions have been contributed by igners. For example, F. Stübben, city itect of Cologne, laid down some useful ciples for the extension and internal rovement of towns. Before very long it will n to dawn on enlightened public opinion the extension of a town ought not to be to individual enterprise and caprice, but overned by an official department. We seen what unrestricted freedom has done ne suburbs of large towns; how tene- ts have been crowded in places where ought never to have been erected, over and ill-drained sites; how spaces able for public recreation have been ght up at fabulously low prices individuals for commercial purposes, h areas ought to have been acquired by corporation; how gasworks have been nitted to occupy areas close to crowded oughfares, and objectionable factories houses allowed to be erected on sites that uld have been turned to better account. se mistakes have brought with them y sacrifices to public health; they have lved corporations in great expenditure in fying errors of judgment and in reclaim- ites for public purposes, which might have obtained very inexpensively in the first e. We can name several corporations h have bungled in this manner, and the ropolis itself, with its divided jurisdic- s, has set a very bad example. What conditions are that make for healthful lences may be summarised as Herr ben places them—viz., sufficient width streets, sanitary construction, planted sure-grounds, cleanliness of subsoil, r, and air, water-supply, lighting means of communication, arrange- t of building blocks, sanitary plan- g. We need not discuss the import- of wide streets, though it is not one of conditions that English authorities are he habit of attaching much value to. ngst modern scientific sanitarians the nage and plumbing fixtures of a house considered to embrace all that is essen- ; and too little importance has been set n wide streets, spacious squares, and lic parks. The reason is that the pro- ional plumber and engineer have been idered to the exclusion of other agencies. theory that to make a healthy town the vidual houses must be constructed on tary principles and have properly ped drains and ventilating appliances is entirely a sound one, for the houses as s may be perfect, but the surroundings be contaminated or unhealthy. The may be badly drained and water- ed, the sewers imperfect; the air may mpure from various causes, the houses ked so closely together as to have little thing space or sunlight. We have great attention to the unit—the house— little or no attention to its environment surroundings. Other elements of health des the house have to be considered, and e are slowly being apprehended. People beginning to find that they and their dren are better for living in suburbs, re there are plenty of open spaces; that the sight of green pastures and meadow and foliage are health-giving and nerve-restoring, that even the semi-wildness of the common or heath is a valuable tonic and restorative to a jaded constitution. Everyone acknowledges the value of open-air exercise and athletic sports for limbs and muscles, yet they somehow forget that nerves and eyesight have as much need of stimulation or repose as the legs and arms. To refresh and restore the eyes, it is necessary to give them those objects of sight which tend to relax the muscular strain, and to restore the "opposites" to the vision and mind. What are the restoratives to the pent-up city clerk, artisan, or professional man? Nature, green fields, mountain scenery, seaside haunts, these are the surroundings the tired man covets who suffers from nerve exhaustion and fatigue. We can imperfectly provide some of these in towns, but not all. We see, therefore, the value of an arrangement of blocks of buildings, a municipal control of the new streets and squares, their number, size, and height. The width of a street—by which we chiefly mean the relation existing between the width of road and the height of the houses—is an important factor of health. Who that lives in a narrow street of lofty houses, generally shaded and dull, does not find its depressing effect upon the health and nerves? Statistics prove that those in narrow streets, shut out from the sun, are less healthy than those who inhabit houses well exposed to the sunlight and live in wide thoroughfares. The dweller in basements is another victim of ill-health and nervous prostration, and for similar reasons. Regarding the relative healthfulness of arrangements, it may be noticed that those blocks of buildings which are most intersected by streets enjoy the conditions favourable to health. The question of arrangement and disposition of the buildings and streets composing a town bears considerably on its health, though a point that has been overlooked by writers of papers. The direction of the streets in respect to sunlight and currents of air is another material consideration.

The importance of official measures, some positive and others negative, requires very little advocacy. As Herr Stubben says, a plan for extending a town with regard to buildings already commenced and those to be built during the next 20 years ought to be a positive measure. Such a scheme would prevent the ill-thought and jumbled laying out of new estates, whenever increase of house accommodation is called for; it would lay down in advance roads and streets, and prescribe improvements to the older parts of the town. Other measures would promote dwellings for the labouring classes, prescribe regulations for buildings, yard space, and frontage lines, height, and other things in the matter of by-laws. The negative measures would prohibit all kinds of buildings of an objectionable character, the use for dwellings of underground rooms, over-crowding, and other objectionable practices. Our usual by-laws confine themselves to structure mainly. There are no restrictions as to the class of buildings allowable in streets; thus we have many objectionable buildings of the warehouse and factory class near, and even within, residential streets. The height and line of building, though recently made subjects of legislation, are inadequately dealt with, and the laying out and extension of towns are not under control. Again, the grouping of buildings at low rentals, as treated by M. Charles Lucas, a Parisian architect, is not brought within the scope of the Building Acts. The hygienic problem has its moral as well as its sanitary side; but that aspect which concerns itself with artistic conditions, picturesqueness of groupings, pleasure-grounds, and recreative buildings is quite ignored by our statutes.

As Mr. Blashill, the London County Council's architect, says, a supply of light and fresh air to habitable rooms is not secured by the existing law in London so efficiently as it might be, as it has been legally decided light and ventilation need not come directly from the outside, and if they are admitted through another room no open space need be provided, or if it is provided, there is no power to secure that any room shall be lighted or ventilated from it. The Amendment Act of 1882 as to open spaces in the rear of dwellings is, as we have before said, very inadequate, as it is allowed to cover the space with one, story buildings. No beneficent rule can be established which does not regulate the open space attached by at least one factor, and that is the height of the building. To what an extent the principles of hygiene can be applied to architecture it would not be easy to say. There is nothing in the art necessarily opposed to health in the abstract, though some of the revivalists of defunct styles, amongst them that of the 17th century, have not thought fit to show any marked relationship between the architecture and sanitary science. Sir Arthur Blomfield's address only referred to some of the possibilities of a relationship to which the profession would do well to direct their attention. There are many things and objects of sense that have a potent influence on our minds, in soothing and giving pleasure through sensations and emotions, others that give pain. Even a well-proportioned room or door or window creates an agreeable sense; a well-designed wall paper or ceiling can produce pleasurable emotions, and these react on the physical functions, and can be made conducive to health. On the contrary, we know the effect of discordant forms, designs showing want of fitness, inharmonious colours and decorations, how they jar upon the eye or nerves of a man or woman susceptible to their influence. Concede the proposition that disagreeable objects and colours have a tendency to disturb the mind, and are, therefore, injurious to health, we must admit as a necessary corollary the converse—that artistic design is a part of hygiene, and, as such, ought to be studied and made a function. The æsthetic side of architecture will supply the reflective student with many instances of the effect on the imagination, and therefore on the health, of many kinds of agencies with which the artist can deal—a question discussed by Herbert Spencer and other philosophers who have investigated the psychological basis of the fine arts.

BRIDGE BUILDING, OLD AND NEW.

THE development of bridge construction is a fertile theme, whether we regard it as one of the many indications of advancing civilisation, or as one of the records of man's mechanical ingenuity in bridging over space. A bridge of timber or of stone must have been one of the earliest exercises of the builder or architect, for architects were bridge builders till within a comparatively recent epoch. To throw across a stream or river a few poles or logs, and to form a platform for the passage of traffic, must have been the earliest sort of bridge. Across wide rivers it became necessary to erect intermediate supports, one, two, or more, and then the necessity arose to strengthen as far as possible the logs or beams which were placed across these supports. In this manner framing or trussing began to be introduced, and the first efforts in this direction were no doubt simply to place a strut from the vertical support or pier of piles to the horizontal beam, and these oblique pieces or struts become the germ of the truss or cantilever. These primitive structures were exceedingly simple and often picturesque. By cutting off the square angle between the upright pier and platform the structure assumed at once a more pleasing and less crude outline, and many of these

simple log or hewn timber structures still remain, and are highly artistic. Let us take as an example the description given of Cæsar's bridge as given in "De Bello Gallico," Book IV., chapter xiii. It was simply constructed thus: A couple of rough logs or piles were driven into the bed of the river about 2ft. apart on each side of the intended bridge, sloping a little inwards at the top; across these pile-piers, fastened together by a cross piece at the top, were laid the transverse beams to carry the bridge floor, each end being laid in between two braces on each side, and in consequence of these being in different directions and fastened on sides, the one opposite the other, so great was the strength of the work and such the arrangement of the materials that in proportion as the greater body of water dashed against the bridge, so much the closer were its parts held together." Several attempts to restore this design from Cæsar's description have been made, even by such men as Alberti, Palladio, and others, though their interpretations have varied. Cæsar's army crossed the Rhine on this structure, which had been commenced only ten days before. Other ancient bridges of which we have records show timber construction. One by Trajan over the Danube was of concentric ribs of timber connected by radial pieces, each arch about 100ft. span, of which there were several. Many old Mediæval bridges are shown in paintings and old engravings, and these were generally of piles with the strut arrangement. Palladio was a great bridge builder, and has given us designs for bridges in his "Treatise on Architecture." The bridge over the Brenta near Bassano built by him was formed of five spans, the floor beam strengthened by struts and straining pieces, with a covered colonnaded roadway. He erected another over the Cismone of about 108ft. span without piers, which was a timber truss not unlike a queen-post roof with tie-beam queen-posts and three intermediate verticals with raking struts in each bay. Another design is a segmental arch or truss, composed of two concentric stringers or ribs, with radial pieces and cross-bracing between each. These radiating bays represent framed voussoirs, and the design may be regarded as the prototype of all framed timber and iron arched trusses of its class. Engravings of these are also given in Tredgold's "Treatise on Carpentry." Of the curved rib or wooden arch type the Americans have been great adapters. One of 250ft. span across the Portsmouth River, of three concentric ribs, connected by radial pieces, with mortices and wedges, somewhat on the principle of Palladio's design, is described and illustrated in Tredgold's work (last edition); but each rib is made of pieces 12ft. or 13ft. long, fastened by dovetailed keys and wedges, breaking joint. The wooden arch bridge over the Delaware at Trenton, near Philadelphia, of 200ft., 180ft., and 160ft. spans, with a roadway suspended by iron rods; the Susquehanna bridge at Columbia, and some fine structures in Germany—notably the Bridge of Bamberg, the Freysingen over the Isar—show the considerable spans and strength that have been attained by the use of arched ribs. The last-named are of different curvature, the flatter ribs on the upper or outer side bolted together. Other bridges combine the lattice with the rib. Different methods of forming or constructing the curved ribs have been adopted. In some of these the ribs are bent by screws, and then scarfed and bolted to the others, as in the method used by Wiebeking in the last-mentioned structures.

It is impossible to pass these developments of construction in review without seeing the steps of the transition from the early trussed bridge to that of the arched rib. The principle of simple compression was kept in view. As economy of material had to be considered, it was necessary to employ moderately small pieces of timber, and either to construct an arch of timber like that of the voussoir framed bridge of Palladio, or to build the ribs by bolting or uniting several pieces together, as Wiebeking did. We certainly cannot commend the masking of the fronts of the ribs by boarding to imitate masonry, as in the bridges at Bamberg and Freysingen, and several other structures of this last bridge builder; and generally it must be admitted regretfully that advanced skill is often accompanied by a loss of taste. The older ribbed bridges exhibited the construction, and were pleasing structures of wood; but with the desire to bridge over large spans, the attempt to represent stone was made, and the art of the bridge architect declined.

Stone bridge construction may claim as ancient a record. Upon Trajan's Column is represented one of the oldest bridges over the Tiber, the Ponte de' quattro Capi, a two-semicircular-arched structure, with central-pierced pier, built 62 B.C. Aqueduct bridges of double tiers of arches are noteworthy amongst the works of the Romans. Stowe describes a fine masonry bridge at Stratford-le-Bow as a "rare piece of work, for before that the like had never been seen in England." Many old Mediæval bridges attest the architectural skill of the masons, and there are few rivers which have not been spanned by bridges of double span with central pier and chapel dedicated to some saint. As a type of the Mediæval bridge of small span, we may cite the remains of the Abbot's Bridge connected with the monastery of Bury St. Edmund's, with its three pointed arches springing from buttress piers. Another picturesque structure is the Mediæval bridge at Burford, Oxon, having small circular arches, triangular recesses over the piers, and coped parapet, a structure quaint and interesting; also that at Bradford-on-Avon, with its mass house or chapel on the central pier, which forms a projection corbelled out and covered by a square dome. Triangular buttresses forming cutwaters are noticed, together with pointed arches, moulded below over the openings. These are typical examples, but a more important Mediæval structure of stone is the Bridge of Valentia, Cahors, with its embrasured and embattled towers and projecting triangular recesses. These structures are giving way to bridges of iron, having wider water-ways and offering less obstruction to river traffic and the flow of rivers; but in other respects the substitution has not been unattended with disadvantages. For durability and permanence we may say that our stone and granite bridges, like those of London Bridge and Waterloo Bridge, will stand when more recent iron bridges, like Westminster or Blackfriars, have become seriously impaired by the action of the atmosphere. The constant need of examination, cleaning, and painting is a source of expense in the maintenance of iron structures, which is saved in the case of stone bridges. In both of them the stability of the foundation of the piers is essential.

In iron bridge construction development has been rapid. Engineers have followed the lines and principles of timber. There is the lattice which represents the level or horizontal beam, the cast-iron arch which follows the method of timber arches, and which mainly depends on abutments, the wrought iron plate arched rib, and the cantilever system of construction. Cast iron naturally preceded wrought iron and steel. In 1777 Abraham Darby is said to have built the first cast iron bridge on record across the Severn at Coalbrookdale. The arch was nearly a semicircle, with a chord of 100ft. The fine bridge over the Wear, with a span of 240ft., was erected in 1795, also of cast iron. One of the largest arched bridges of this material is Southwark Bridge, over the Thames, designed by Rennie in 1818. At Buildwas Telford had erected another. The Victoria railway bridge over the Thames, carrying the Chatham and Dover and Brighto[n] and the new railway bridge at Bla[ckfriars] are examples of arches of iron, e[ach] being made up of several segments [bolted] together, which form so many vo[ussoirs]. Wrought iron and steel have offer[ed] siderable advantages for bridges [of] spans. Despite other forms of girder [bridges] such as those of open lattice we[b] curved upper flanges, the arch still h[olds] own. The cantilever form has be[come] favourite with engineers, and the F[orth] bridge is the most conspicuous exa[mple] this country, but its principle has been [used] for centuries in the East. A treatise pu[blished] in 1811 by Thomas Pope, published [in] York, speaks of the "superior adv[antage] of the flying lever bridge"—a form [of con]struction known for centuries in Ch[ina] Japan, which was a cantilever bri[dge] timber. But we wait for the artis[tic de]velopment. Increase of span has be[en] one aim of the engineer; but it ha[s been] fatal to the artistic sense. The wid[e span] like the plate-glass window, has banis[hed] architectural effort. The very ten[acity] steel is prejudicial to an effective tre[atment] besides favouring intricacy and com[plexity] of structure. At present, at least th[ere] seems little opportunity for the ar[tist] so long as existing trammels are sub[mitted] to. Encouragement there is, howe[ver], the fact we have shown that iron co[nstruc]tion has, after all, been an evolutio[n from] timber and stone types, and that as s[oon as] theories of construction are brought [under] the notice of the architect, even ste[el may] yet give rise to a style of bridge const[ruction] combining simplicity and elegance [with] lightness and strength.

THE SYMBOLISM AND IC[ONO]GRAPHY OF EARLY AND [MEDI]ÆVAL CHRISTIAN ART.—XV.

By George Ashdown Audsley, F.R.I.A
(Author of "Handbook of Christian Symbolism" and several works on Architecture and Art.)

PORTRAITURES OF GOD THE FATHER.

THE brief notes given in our previous article are probably sufficient to acquaint the student of Christian Iconography with all the salient points connected with the divine Hand—the sole symbol of God the Father met with in Christian art. Accordingly, we may now direct his attention to portraitures of God the Father, and Christ iconography generally. As we have already said, prior to the 12th century Christian artists showed no disposition to represent the First Person of the Trinity in the form of a portraiture, or in the likeness of man. Didron is very emphatic on this matter, he says:—"During the first centuries of Christianity, even so late as the 12th century, no portraits of God the Father are to be seen in works of art. His presence is intimated only by a hand issuing from the clouds from heaven." Didron's great knowledge and deep study of Christian Iconography invest his statements with an authority which the student must recognise, and it is only in rare cases that any doubt can arise regarding the truth and general accuracy of his statements and conclusions. We have certainly ventured to question his views on the signification of the rays or bars on the field of the divine nimbus, and we think with sufficient reason; but we know of no other iconographic matter on which our respective views materially differ.

The portraitures of God the Father may be arranged into three groups. The first comprises those in which the head of the Deity is only depicted; the second group embraces half-length figures, usually represented from the waist upwards, but sometimes comprising the head, shoulders and arms only; and the third group presents full-length figures, either erect or sitting

might naturally be expected that the of God the Father would always be l, in Christian art, of a highly dis-ve type, having a treatment peculiar :self which would render miscon-)n of the artist's intention im-)le; such, however, is not the The visage of God the Father dif-:onsiderably in different portraitures, uch so, indeed, that it is not always at first sight to decide whether the or Second Person of the Trinity is ded by the artist. In certain repre-tions of the Holy Trinity, the features th the Father and the Son are as nearly ical as the skill of the limner could them. Didron gives a good example s treatment, from a French miniature, ited in the early part of the 13th ry. In representations of the Trinity, however, generally easy to distinguish 'ersons, for even when the faces and s bear no distinctive character, and the are identical, there is commonly an ute in the hands of one or other of the ns which serves as a more or less direct For instance, in the miniature just n of, one of the figures holds a staff similar to the Cross of the Resurrec-but without the usual small banner; his attribute would seem, in the lan-of iconographic art, to clearly indicate he Son: but here some new difficulties which we may point out in the manner n puts them. He says:—"As early e 14th century, and especially in the tures of manuscripts, one can observe the ncy strongly displayed amongst the ar-f the period to give finally a special figure iovah. Nothing can be more curious to observe the timid and successive of an art which, until then, had dis-l no desire or had failed to depict in atisfactory manner the Omnipotent ity, God the Father, the Creator. try more and more to characterise n a marked way, and to distinguish ortraitures from those of God the Son. eally assists at the birth and at the pment of the image of the Eternal r. At first, as we have seen, there is ntity between the figures of the Father ie Son; it is impossible to distinguish The similitude is as perfect as that ing between two copies of the same" At this point Didron directs atten-a miniature, executed in the end of th century, representing the Creation am by the co-operation of the three ns of the Trinity, in which it is abso-impossible for one to distinguish of the figures is intended for the r and which for the Son. Then, ng to the Trinity in the Early 13th-y French miniature, of which we have , he says:—"Both the Father and n are bearded, and cannot be distin-d one from the other. Is it the Father seated? But He holds in His hand oss of the Resurrection which is in-ly the attribute of Christ. Is it the But He is seated on the left hand of ner Person; and according to Scrip-he Son's place is on the right hand of ie Father. Besides all this, these two s of the Trinity are represented as of ne age, and alike in figure and coun-e."

to the end of the 13th century, the an artists very rarely sought to im-distinctive character to the face of e Father; and in many instances we works of the 14th century, figures of ther with the countenance which one lly recognises as that given by tradi-the Son. Such a practice of necessity some confusion of ideas in the mind of ung student of Christian art. The nich one commonly meets with in the portraitures is youthful, with long nd with a short beard and a moustache. The expression is open and benevolent. The face is sometimes beardless, as in a French miniature representing God the Father in Glory, in an initial letter of a manuscript of the 11th century. Such a countenance is of course quite appropriate, according to the accepted canons of art, to Christ, but hardly so to God the Father. We shall show presently that the youthful, bearded type of face is the one adopted by the artist for the portraitures of God the Father in the interesting scenes of the Creation which decorate the walls of the nave of the Cathedral of Monreale. Didron alludes to a bas-relief on the lower part of the sanctuary of the Church of Saint-Saturnin, at Toulouse. In this work, God the Father is represented inclosed in a lenticular aureole, attended on his right-hand by a cherubim, around whom is inscribed the words, "Ad dextram Patris cherubin stat cuncta potentis"; and on his left hand by a seraphim, round whom are the words, "Possidet inde sacram seraphin sine fine sinistram." The face of God the Father is beardless, and its features are soft, and its expression is benevolent. The whole figure strongly resembles that of Christ, as met with on the early sarcophagi, the fresco paintings in the Catacombs, and the most ancient illuminated manuscripts. The head is invested with the tri-radiated nimbus, upon the lateral rays of which are inscribed the two Greek letters α, ω. The figure is surrounded by the four symbols of the Evangelists, and carries an open book containing the words, "Pax vobis." By the inscription this portraiture is clearly proved to be that of God the Father, whilst it has a semblance of God the Son. It addition, the book, evidently intended for the Gospels, containing the words of the salutation of Christ to His Apostles, seems to identify the figure with God the Son. Has this been, on the part of the artist, an intentional rendering of the Father under the semblance of the Son; or is it simply a proof that the artist could not, by any means then recognised in art, individualise the Father by a distinctive treatment? We incline to the latter idea, for he has indicated his intention by the inscription round the cherubim and the letters on the nimbus. But we must acknowledge that the former may be the correct explanation; for it is impossible to study Christian Iconography without becoming impressed by the continued preference given by artists to portraitures of Christ, and the reluctance displayed to depict in a distinct manner those of God the Father. While on this rather important subject we may give our readers some very pertinent remarks by Didron. He says: "It is easy to understand how the Father, the Son, and the Holy Spirit might concur in the same actions, and manifest Themselves at the same time in the various events recorded in the Old Testament, because the Trinity is doctrinally indivisible, and every act performed by one of the Persons is performed collectively by the three persons of the Trinity. From the moment, however, that a single Person is represented in art, it would seem fit that God the Father alone should be shown in the scenes of the Creation, just as God the Son should appear in the scenes of His Passion, and God the Holy Ghost at Pentecost. It seems an extraordinary thing to represent God the Son alone creating Adam and Eve. Historically speaking, it is an anachronism, for the Son, Jesus Christ, had not then been born in His human nature. Still, nothing is more common than to see Jesus Christ taking the place of God the Father, and creating the world alone, commanding Noah to build the ark, arresting the hand of Abraham raised to sacrifice Isaac, and speaking to Moses from the midst of the burning bush.

"Further, it would seem that artists, when they essayed to represent God the Father as conversing with Abraham, Moses, the prophets, and the kings, felt restrained by fear and awe, and ventured to depict a portion only of the figure—the hand, for instance, and at other times the face, more rarely the bust, and very seldom the entire body. Thus the figure of God the Son either supplants that of the Father, in representations of acts recorded to have been directly performed by the latter, or the smallest portion of God the Father's person is delineated, or He is veiled or altogether omitted . . . . In the first place, God the Son is depicted instead of God the Father. It will be sufficient to observe here that Christ shows Himself in ancient art under two perfectly distinct forms. Either, as on the early sarcophagi, on certain Greek fresco paintings, and in some sculptures executed under Byzantine influence, He is youthful, beardless, an adolescent of from fifteen to eighteen years of age, with feet usually sandalled and occasionally bare, with long hair falling on the shoulders, and without a nimbus; or, as is more commonly the case, particularly in Western art, He is represented about thirty or thirty-three years of age, as at the time of His Crucifixion, with a rather long face having a short beard, hair of moderate length and parted in the centre of the forehead, the countenance sweet but with a melancholy expression, the head invested with the divine nimbus, the feet bare, and clothed in a long robe and mantle. In seeing either of these two portraitures which have been consecrated to Jesus Christ, the Saviour, it is impossible to mistake them or confuse them with portraitures of any other Person. Besides, not only is the expression of the face a sufficient characteristic; but to prevent any mistake, His name is frequently written in some position close to the portraiture, or round the head, either at full length, in an abridged form, or as a monogram.

"Now, in a great number of monuments representing the Creation, and those Old Testament scenes in which God the Father is the chief actor—it is not the Father who is portrayed, but God the Son, clearly to be recognised by the hieratical character of the face, and the names inscribed. Christ, as has just been said, is thus represented youthful and beardless, on a multitude of marble sarcophagi belonging to the early epoch of the Christian era—from the fourth to the eighth century. There can be no question that the portraiture is intended for that of Christ, for amongst the subject represented on those sarcophagi, we find the raising of Lazarus, the restoration of sight to the blind man, the cure of the paralytic, the miraculous feeding of the multitude, the conversation with the woman of Samaria, the triumphant entry in Jerusalem, the appearance before Pilate, and the preaching to the Apostles; and the Person represented as raising the dead, restoring the sight, healing the diseased, multiplying the loaves and fishes, journeying in triumph, standing before Pilate in his judgment-hall, and preaching to his followers, is the same beardless youth of whom we have spoken—it is Christ in His adolescence. Sculptured on the same monuments, and usually on the left side, are subjects parallel to those just enumerated. God is here seen condemning Adam and Eve to labour, commanding Noah, arresting the hand of Abraham, giving the Law to Moses; and God is invariably represented by the same beardless youth, who, in the adjoining compartments, raises Lazarus from the dead, and who sends his Apostles to preach throughout the world. It is God the Son who in these Old Testament subjects takes the place of God the Father."

Didron gives an interesting illustration, taken from an early Christian sarcophagus, preserved in the Vatican. Three figures are represented—that on the left being intended

for Adam, and that on the right, a nude female, being Eve. The central figure—youthful, beardless, clothed, and holding in the right hand some ears of corn, and in the left a lamb, is evidently God, condemning Adam to till the ground which shall bring forth such ears of corn as He holds towards him, and Eve to spin into threads the fleece of the lamb He presents to her. Didron pertinently remarks:—"One might imagine the Deity speaking to Adam and Eve to be intended for God the Father, although it may seem singular to see the 'Ancient of Days,' as He is called in the Bible, and by the Greeks (ὁ παλαιὸς τῶν ἡμερῶν), scarcely past the age of infancy; and it might reasonably be thought that, adhering in this respect to the practice of the ancient Greeks, the early Christians had represented God the Father, the Jehovah, as youthful and beardless, in order to convey the idea of the unchangeableness of the Deity—He who never can become old, but lives on in everlasting youth." Didron here admits that the intention of the early artist is open to doubt, and it is probable that the idea above expressed would be favoured, were it not for the fact that in numerous other works, in which the scenes of the Creation are depicted, the Creator is distinctly rendered in the likeness of Christ. Didron furnishes an admirable instance of this from an ivory carving of the 12th or 13th century. In this work Adam is represented as lying on the ground lifeless; and above him, in a circular inscribed aureole, is a half-length figure of Christ stretching forth the right hand, in the act of blessing Adam. The head is invested with the tri-radiated nimbus. Didron says:—"This illustration leaves no doubt that it is indeed Christ who is represented presiding over the work of creation; for here the Deity is shown in the act of creating Adam the first born (Ἀδὰμ ὁ πρωτόπλαστος), and this Deity is unquestionably Jesus Christ, as is proved by the monograms of His name IC, XC, inscribed on the field of the circular aureole whence He appears to issue."

It is noteworthy that we find in the Greek *Guide to Painting*, the following directions for the representation of Moses and the burning bush: "Moses untying his sandals. Sheep stand around. In front of him a burning bush, in the middle and rising from the top of which is the Virgin holding the infant Jesus; close to her an angel, who looks towards Moses. At the other side of the bush, Moses is again depicted, one hand is outstretched, while the other holds a rod." This is a highly curious direction from the works of the great Greek painter, Panselinos (see Article II.), and clearly proves that so late as the 11th century it was customary to substitute figures of God the Son for those of God the Father in Old Testament subjects. Why the Virgin and Child should be represented in the burning bush is not easily understood. Didron assures us, and his deep researches into Byzantine art give his words great weight, that the Greeks, or the artists of the Eastern Church, not only substitute Christ for God the Father, but even the Virgin Mary, and that, too, in scenes which took place eleven hundred years before her birth.

We may leave for the present the consideration of the early portraitures of the Deity, in which artists have or have not desired to represent God the Father in His proper Person, or in which artists have intentionally or inadvertently substituted for the figure of God the Father, the Creator, that of God the Son, and turn our attention to later works in which the portraitures of God the Father assume unmistakable characteristics.

As might be reasonably expected, when artists seriously essayed to depict God the Father, the Creator of the universe, the "Ancient of Days," they chose a figure and a countenance which carried the marks of age, combined with vigour and high intellectual powers. The age carried with it no evidences of failing bodily or mental strength. To convey through painting or sculpture any adequate idea of the unimaginable and unapproachable Deity, invisible and omnipresent, by representing Him in the form of a man, was in the middle ages, and, indeed, still remains, a task never to be accomplished. The artists of the early epochs of Christianity fully realised this, whilst those of later centuries must have keenly felt it as they held the brush or chisel.

In the 15th century we find the countenance of God the Father decided artists. In the accompanying illu Fig. 48, from the fresco by Paolo U the Dominican Monastery of St Novella at Florence, a half-leng

THE CONGRESS OF HYGIENE.

IS congress, of which we reported the
earlier proceedings in our last issue,
11-3, closed its meetings on Monday.
g the more interesting of the papers read
later days was one on

STATUTORY EXAMINATION AND REGISTRATION OF ARCHITECTS,

by Mr. W. Howard Seth-Smith, President
Society of Architects, on Thursday after-
before Section IX., that of State Hygiene.
uthor remarked that the difference of
n on this subject in the architectural pro-
was not on the question as to whether a
ystematic and thorough training of archi-
as required; all admitted that education
e regarded as the basis of progress. The
n dispute was as to whether any test of the
g all agreed to be necessary should be
, and, if so, whether that test should be
ompulsory. All would concur with him
irming that, failing to possess the
ualification, a person had no right
ume the title of architect. A few
rs of the profession were opposed
examinations and diplomas on the ground
tistic qualities could not be brought to the
examination; but they lost sight of a
ıental principle—that architects' oppor-
s of practice were dependent upon the
nce of the public in their qualification to
usted with commissions. A man was not
rily a worse designer because he was an
lished constructor. They must remember
at they could not regulate the training of
fession generally on the lines laid down
e dozen exceptionally able men. They
s in all other professions, deal with the
the average man. The certain result of
ccess of the anti-examination movement
be that those proposing to build would
o the builder in the first place, and if an
t were employed at all on the work he
be called in, not by the client, but by
tractor to decorate his plans and construction. The author referred those who wished for further information on the subject of the proposed scheme of architects' registration to a paper read by Mr. H. Roumieu Gough in 1888, and another on the "Legal Registration of Architects," given by Mr. J. Wreghitt Connon, of Leeds, in the same year, and also to his own paper read in 1886. Mr. Seth-Smith briefly sketched the principles of statutory registration, showing that these were precisely those which led the Royal Institute of British Architects to establish test examinations, and then at a given date to close their doors against all who did not pass those examinations. The author gave several reasons why such a Bill ought to be passed. There were precedents for taking such a step in the fact that already about a dozen Acts registering other professions had been passed. The step taken by the Institute of Architects in establishing an examination before admission to membership conceded the principle of tests; but unless a general measure were passed the public would not have confidence in the Institute scheme of examination, especially as that body represented only a small proportion of the 10,000 architects practising in the United Kingdom. Under present circumstances it was preposterous to pass enactments imposing penalties for breaches of sanitary conditions in our houses. He further showed that examinations were already provided by law for candidates for metropolitan district surveyorships. He concluded by moving "That this meeting cordially approves of the principles of the statutory examination and registration of architects." This was seconded by Dr. George Reid, medical officer of health for Staffordshire.

A discussion followed, in which Mr. Arthur Cates, Mr. Mark H. Judge, and others took part, and eventually the resolution was carried by 22 votes to 14. A further resolution moved by Mr. M. H. Judge, and seconded by Mr. W. J. Fletcher, was carried, "That it is desirable that architects should be registered before being appointed to any public office."

At a meeting of the Architectural Section on the following day, the President of that section called attention to the fact that this resolution had been carried in an adjoining room, and it was moved by Dr. Sykes, and seconded by Mr. Ernest Turner, F.R.I.B.A., "That the members of the Architectural Section desire to consider the resolution adopted by the section on State Hygiene, approving of the statutory examination and registration of architects before definite adoption by resolution of the Congress, and that they are of opinion that this question should have been referred to Section VI.—Architecture in relation to Hygiene."

ASYLUM ARRANGEMENT AND CONSTRUCTION.

A paper on this subject was read on Friday by Mr. George T. Hine, F.R.I.B.A. He showed that asylum construction differed from other work in demanding consideration of the mental condition as well as of the physical well-being of the insane; and this necessitated in the architect some study of their disease and habits. Much might, he thought, be done towards the cure of insanity by careful designing and construction of the asylum; but if great success was to be attained, the architect should not be too closely restricted in cost. For the theme of his paper the pauper institution was selected. The author proceeds to explain the principles in the selection of site: elevation, aspect, nature of soil, and water supply. In the general arrangement of an asylum, the first question to be determined was the principle on which it should be built. In this country, asylums were built either on the "pavilion" principle, where the different blocks were connected together, and communicated with the administrative centre by one-story corridors, or as continuous buildings—the latter being the most common and convenient plan for small asylums. Another form of asylum of recent adoption in America, and on the European continent, was that of entirely detached blocks, with a central or main building, comprising a number of villas, in which patients could be effectually segregated. When the constructional principle was determined, the first care should be to arrange the wards in the best positions for aspect, light, and air, and all within easy reach of the administrative centre. It was also important that the wards should be arranged so that the medical officers in their rounds might not have to retrace their steps unnecessarily. The position of the wards was a matter of equal importance. The day-rooms should all, if possible, have a southern aspect; certainly every ward should have one or more day-rooms to the south, and the blocks should not be built to look out on to one another. In large asylums this almost necessitated a plan on the "echelon" principle, and in very large buildings even this required modification, or the length of the corridors would become quite impracticable. In all asylums, unless built for special cases, there should be accommodation for the following: 1. Sick and infirm, including a small ward for newly-admitted patients. 2. Acute or refractory cases. 3. Epileptics. 4. Quiet and working patients. Some of these wards again admitted of further subdivision. The infirmary wards, which, including the reception ward, should generally provide accommodation for one-fourth the total number of patients, were best placed nearest to the administrative centre and to the medical officer's rooms, and should not exceed two stories in height; or, if three, the top floor should be devoted to dormitories for quiet patients. Each ward should be self-contained on a floor, and should comprise one or more roomy dormitories, one with a southern aspect for bedridden patients, and with windows on at least two sides to allow of cross-ventilation, as, indeed, should be the case in all dormitories where practicable. At least two comfortable day-rooms should be provided for convalescents, one especially for dining in. The number of separate single rooms in an asylum was a point about which there was much diversity of opinion. Generally, if the dormitories were numerous and moderate in size, single rooms for one-fifth of the total number of patients would be sufficient. Single rooms should have shutters to the windows, and, except in the infirmaries, no single room should be warmed by open fireplaces. Doors without inspection holes or shutters were best. In epileptic wards a narrow panel or other clear opening had to be left, to allow of an attendant hearing a patient when in a fit; but in other cases inspection holes or shutters suggested espionage, and were therefore undesirable, particularly as it was an easy matter to use a silent lock actuated by the handle. The infirmary should have, in addition to the single rooms last named, rooms for attendants, excluding night attendants, who should be housed in a block by themselves in a quiet quarter; also lavatories, storerooms, and water-closet annexe, as with all the other wards, and, in addition to these, bath and dressing rooms. Infirmary patients should have separate bath-rooms in their wards. Each ward should also have a scullery, fitted with a small range, washing-up sink, and cupboards for crockery and utensils. The water-closet annexe in the infirmary, as in all other blocks, should be constructed in a spur, separated from the building by a cross-ventilated passage. It should include closets, in the proportion of one to ten or twelve patients, with an additional one for attendants, a small room for slop-sink and brushes, another for dirty linen, a coal place, and, on the male side, urinals. The walls of all closets should be faced internally with glazed bricks, or lined with enamelled tiles. The floors should be of concrete, tiles, or some equally imperishable material not affected by wet. The doors of water-closets should be low and raised a foot or more from the floor, to allow of observation, and should open outwards. The closet apparatus should be of simple construction, without valve or anything to get out of order. The author preferred a hopper basin, straight down behind, with earthenware trap all in one piece, rather than a "wash-out" basin—a good quick-acting cistern with large service pipe, but not with automatic action. Next to the infirmaries should come either the ward for acute cases or for epileptics. In a small asylum the latter might be on the ground floor, with a ward for acute cases over; but, in any case, epileptics should, if possible, be housed both day and night on the ground floor. The day-rooms should be rectangular, without breaks or obstructions, behind which a patient might get lost sight of while in a fit. The adjuncts to the ward should be the same as in the infirmaries, but with only one bath in connection with the dormitory, for cases of emergency. The dormitory should be large enough to hold fully five-sixths of the patients in the ward, the remainder sleeping in single rooms, which, unlike other wards, should open out of the dormitory. The ward for acute

cases might be situated either on ground or first floor, if made sound-proof. This ward was best broken up by dividing the day-rooms into several smaller rooms by partitions partially glazed. The single rooms, accommodating one-third of the whole number of patients, should open out of the day-rooms. There should be one or more associated dormitories on the same floor for troublesome cases; the remaining patients sleeping on the top floor of the building. In other respects this ward need not differ from the infirmaries already described. The wards for quiet and working patients, or "chronic cases," might be very simple in design and arrangement. Staircases should be of ample width, and easy of ascent, and always of non-combustible material, for which purpose concrete was better than stone. Floors constructed on a fireproof principle offer many advantages, both against the spread of fire and the conduction of sound, and did not add so much to the cost of a building as was generally supposed. The administrative department should include kitchens and other offices, a general store, a recreation hall, also laundry buildings for the women, and workshops for the men. The chapel might be connected or detached; the superintendent's house was preferably detached. A separate block should be provided for nurses and attendants, not sleeping in the wards; an isolation hospital, mortuary, and other buildings were always necessary.

On Monday, the closing day of the Congress, the resolutions passed in the various sections were announced. They included motions in favour of hygiene instruction as an integral part of education; and also in support of special legislation for the control of block dwellings for the industrial classes in cities, of cremation as a rational and hygienic procedure, and in favour of an improvement of the conditions relative to the appointment of inspectors of nuisances.

The next Congress, to be held in 1894, will take place in Buda-Pesth.

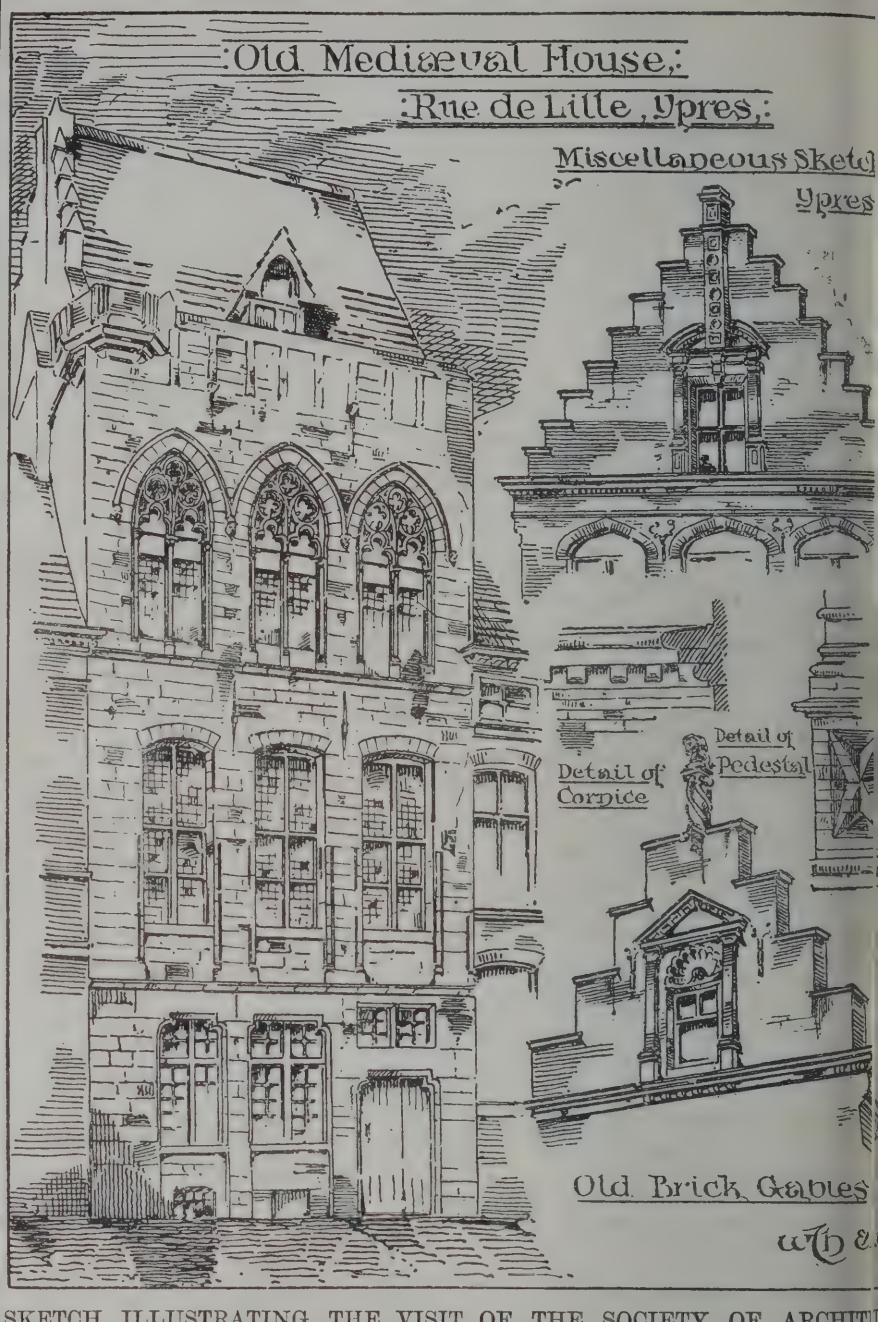
THE SOCIETY OF ARCHITECTS IN BELGIUM.

THE annual excursion of the Society of Architects opened this year under exceptionally favourable circumstances. In itself the tour has a novel feature; it is being made in a European country, in a foreign land, and to the best of our belief no other English society has hitherto attempted such a feat, though excursions have been made to Italy unofficially by parties formed by the Architectural Association, and to the United States and various English colonies by other societies. But beyond this, the tour has commenced by a reception of the forty-one members and their friends who formed the party by the King of the Belgians at his palace at Ostend on Saturday afternoon. The audience had been appointed to take place at half-past five, but the boat was somewhat late, in spite of a fairly calm passage, and there was a great scramble to get the luggage through the Customs House and to a private dwelling, in which dressing-rooms had been provided, so that it was more than half an hour later, in spite of the strenuous efforts of Mr. Schembri, the conductor provided by Messrs. Gaze and Sons, before the members had donned their dress suits and were ready to march to the palace, which they did in "open order." Arriving, they were ushered through a long corridor and several ante-chambers to the presence of his Majesty, a fine, kingly-looking man, before whom they were ranged in a large semi-circle. The King shook hands with the President, Mr. W. H. Seth-Smith, who had advanced, and who then presented the following address, illuminated on vellum by one of the members of the society:—

To His Most Gracious Majesty, Leopold II., King of the Belgians.

May it please Your Majesty,—Upon this, the occasion of the first visit of the Society of Architects of London to Belgium, they desire to express to Your Majesty their sense of the great honour which you have conferred upon them by granting them an audience, recognising in that favour the fact that Your Majesty welcomes them as professionally interested in the ancient buildings of your country, buildiugs whose reputation for beauty is world-wide, and whose origin lies in the civic liberties and enterprise and in the religious devotion of your subjects. These monuments of taste and skill are particularly attractive to the modern English architect, who gladly acknowledges his indebtedness to them for many an inspiration. The Society also recognises in Your Majesty's gracious reception, and that of your people, a desire that the architects of Belgium and of England should be brought into closer and more friendly relations with each other for their mutual benefit, and that the buildings of each country should become better known to the architects of the other with a view to the erection in both countries of works of greater dignity and beauty. This, and other objects bearing upon the development of architecture, the Society of Architects was formed to promote, and its members will continue to support and forward them at all times to the best of their ability.

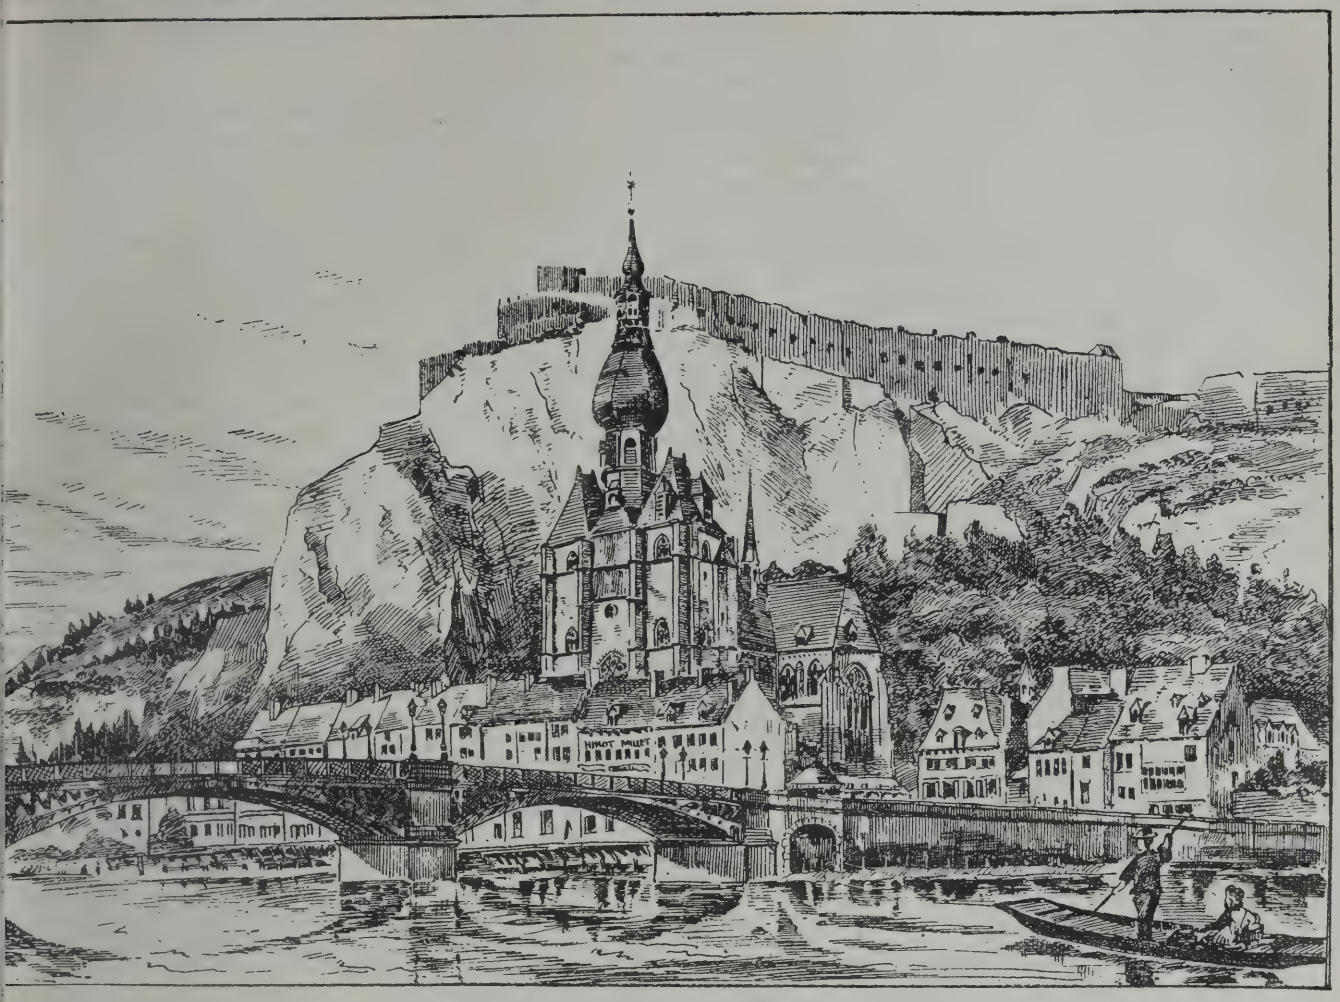
Signed on behalf of the Society,



W. H. Seth-Smith, President.
Edgar Farman, Honorary Secretary.
G. A. T. Middleton, Secretary.

His Majesty acknowledged the address in English at considerable length, dwelling upon all its principal points. He compared the buildings of Belgium and of England with discrimination, giving the palm for old ecclesiastical edifices to our country, and then, after inquiring what places the Society intended to visit, pointed out the principal points of interest in each, and concluded by a few remarks upon the materials of his country, laying particular stress upon the fact that excellent building-stone is to be had. Then each member of the party was introduced to His Majesty in turn, and to each he made some remark upon the buildings of his locality, showing a close acquaintance with the local characteristics of the many parts of England which were represented. Before the audience terminated, the King pressed an invitation to the members to visit his unfinished palace at Laeken, and a time for the visit was named, which will slightly alt programme for Saturday (to-morrow).

After being dismissed, the party hurried Hôtel Couronne for dinner, which they cluded by drinking to the health of the and giving him three hearty English c Later in the evening, the journey was con to Bruges, and in that historical, old-worl Sunday was quietly spent.



It was with the greatest possible regre the members parted, on Sunday afternoon Mr. Schembri, who had proved himself t most indefatigable conductor up to this especially as on Monday morning the business of the excursion began. Monday to be a heavy day, for during the rambles taken on Sunday so many individual m had seen so many specially fine things that impossible not to add several of them to th gramme; for Bruges is full of interesting most of it similar to the "Mont de Piété," we illustrate to-day, and which must by no be thought to be a singular example; it represents a class, to which the "fr Bruges," which we also illustrate, b as well.

The Carmelite Church received first att with its poor exterior and somewhat interior, its main point of interest bei somewhat Rococo Renaissance carving

sionals and the organ gallery. A cursory
was then bestowed upon the Normal School
rls, of which more presently, on the way
o the Hôtel de Ville, where the members
net by M. Saucerie, the city architect, a
of great ability, of considerable general
arian attainments, and especially well
l in the works of his own neighbourhood.
owed the party not only the exterior of the
de Ville, which is too well known to need
ption, but, which was much more appre-
, the old council chamber, now being
ed by him, and which was in such a con-
that, by scrambling over the scaffolding,
e details of the old construction, of the
vaulting of the lower chamber, the false
r pendent vaulting of the upper, supported
n rods, and of the handsome hidden timber
could be inspected. The thickness of the
sed in the guttering (about 12lb. or 14lb.
ot) created much surprise, and somehow
ucerie was led to state the average wages
workmen employed. Labourers, it seems,
e about 2d. per hour, and skilled carpenters
2½d. to 3d., and other mechanics in propor-
while they work for twelve hours every day
t full days each week.

was the gilded house, the "Maison de
en Greiffe," which next received attention,
ts quaint exterior in a kind of Spanish Re-
nce, rich with gilt and colour, harmonising
vith the surroundings, and with a wonder-
fine oak door within, bearing the date 1544,
ally that to the chapel of the Hôtel de
and subsequently belonging to the Cathe-
having panels of exquisite Renaissance
e in low relief. After it the much-vaunted
ey-piece of the Palais de Justice, next
seemed almost coarse in detail, fine as it
itably is, and of almost the same date, 1521.
e jury room adjoining, however, was found
x-case which well repaid examination, with
-designed carved frieze, and with ventila-
anel of interlacing ribbon-work, wrought
oak, dated 1646.

some accident the party here divided, some wandering away to see the lace in the Musée Gruuthuis—a nice old Flemish building, certainly, but scarcely worth the time devoted to it, where so much is excellent. When the party reassembled it was to ascend the belfry (Tour des Halles) to inspect the complicated machinery which controls the chimes, and to admire the view of the cathedral and the town, which could be thence obtained. The beautiful, yet simple, double doors of wrought iron in the muniment room received considerable and well-deserved attention.

On descending, a somewhat hurried visit was paid to the Chapelle de Sainte Sang, no time being allowed for sketching the exquisite Gothic foliage over the doorway—perhaps the finest specimen of Flamboyant foliage in Europe—for a second visit was to be paid to the Normal School. On the way a glance was bestowed upon the old houses in the Place Jean Van Eyck, but only a glance, for M. Saucerie, the architect of the schools, was waiting to conduct the party over them. A fine brick pile, arranged around an open quadrangle, in the ancient Flemish Domestic style, with which the author is so well acquainted, it was acknowledged by all to be a work of absolutely highest merit; and when it is remembered that its author is also the architect of the new post-office and municipal offices now in course of erection in the Grande Place, and of many another first-rate modern work in Bruges, it is impossible not to conclude that he is one of the best architects of his country.

After lunch, at which M. Saucerie was the guest of the president, a visit was paid to the cathedral, whose Canon acted as conductor, and made an excellent guide, though the general proportions of both exterior and interior, save the detail of the choir stalls, were the only points worth observation. The day concluded with an inspection of the Church of Notre Dame and its exquisite little baptistery (illustrated in this issue). A small specimen of Michael Angelo's sculpture over one of the altars there was disappointing on the whole, for though the general pose of the Virgin's figure is easy and graceful, the child Jesus is represented of the chubby angel sort with which the frequenters of Westminster Abbey are but too familiar. Thus a busy and enjoyable day concluded, and the members proceeded on their way to Ghent.

Tuesday, spent in Ghent, was scarcely so busy a day as the previous one had been. It was not that the buildings were less imposing or less picturesque, but there were fewer of them, most of the houses being modern and of an ordinary stuccoed type, so that the temptation which acted so powerfully at Bruges to stop and gaze and sketch at each street corner did not exist here. Almost the whole morning was devoted to the Cathedral, at the entrance to which Père de Balts, the bishop's secretary, and M. Van Assche, the architect for the restoration, the latter acting as an indefatigable guide throughout the day. The Cathedral, as it now stands, is almost an entirely modern building, the tower and the shell of the original edifice alone remaining, for it was destroyed by fire in the 16th century, and has only recently been rebuilt. The first thing which struck the party was the absence of the whitewash and colour which they had already learnt to expect, and then there grew upon them a sense of good proportion and good detail, particularly in the new triforium and clerestory. Slowly they noticed further that, as had been the case at Bruges, the perpends were not truly kept, while the joints of the masonry were clearly visible and roughly pointed, all at a little distance adding softness to the effect, a softness which we English architects generally lose from our insistence upon absolute precision. Soon another fault appeared, far less excusable, for the groin ribs were in many cases crippled, and the brick filling-in was badly done. At the same time other beauties of detail appeared, the actual body of the pulpit, in oak with white marble medallions, being very pleasing in effect, in spite of the curious combination of materials and the usual bizarre effect of the naturalesque treatment of the pedestal and canopy. A good deal of attention was given to a painting by

Van Eyck brothers, in which the perspective lines were shown converging to the sun, and to four brass candlesticks of Renaissance design, said to have been sold to Ghent by Oliver Cromwell, and to have formerly belonged to St. Paul's Cathedral—the older one, of course. Some members doubted whether Cromwell would not more likely have destroyed them; but they are undoubtedly of English origin, and anterior to the accession of the Stuarts, for they bear the Tudor rose in several places cleverly introduced into the foliage of the design, and also the English arms, with the three lions and the fleurs-de-lys, but minus the arms of Scotland. A visit to the crypt followed, and was well repaid, for it contains some capitals of exceptionally early date (10th century), with perfectly-formed volutes at the angles.

The hall of the Château of Gerard le Diable, with its simple pointed vaulting supported on two rows of columns with no neck moulding to the caps, said to belong to the 13th century, received a somewhat hurried visit, and on the way some new Renaissance schools were met with; but, though good, they are by no means to be compared with the Normal School at Bruges.

After lunch, at which M. Van Assche was present, the members followed him to the ruins of the Abbey of St. Bavon, most interesting from an antiquarian point of view, containing, as they do, relics of primitive Roman work in the walling, and much fine Early Romanesque detail, two apparently unique features being pointed out—a very Early Romanesque window in the form of a cross, and some caps with the water-lily worked upon them. The cloisters, chapter-house, and refectory remain in a sufficiently good state of preservation for their original character to be discernible, and some good encaustic tiles were seen, the whole of the ruins forming a most picturesque group.

Compared with its acknowledged excellence, but little time was devoted to the Hôtel de Ville, and many would have liked a longer period in which to study its rich Gothic detail as well as its two Renaissance façades, all evidently built with an eye to the possibility of street combats, and showing evident signs of such having taken place. After this, hurried glances only could be given to the other interesting buildings of such of the members as wished to see them all; but many sat down quietly here or there, and absorbed and sketched some special detail. Thus the bold front of the Church of St. Nicholas was treated, while some had seen the elegant modern interior of St. Michael earlier in the day; but those who still followed M. Van Assche were led to the ancient double Château of the Courts of Flanders, corresponding well to our Norman keeps, but in two stories, complete castle over complete castle, now in ruins, and being opened up previous to restoration. After that a little-known open-timber roof of the 12th century was seen, belonging to the old hall of the Butchers' Guild—the Boucherie, in perfect preservation now, a heavy, solid open roof. Thence a few steps brought the reduced party to the exquisite and well-known Maison des Bateliers, which we illustrate to-day, but of which no illustration can give the effect of the rich detail and the now decaying stone, even if it shows its two near neighbours and great contrasts, a Romanesque and a Renaissance building, erected for almost precisely similar purposes to this. It was with great regret that the members assembled early at the station to proceed to Antwerp, and said farewell to their gulde and companion for the day, M. Van Assche.

THE LONDON CARPENTERS' STRIKE.

THERE is still no prospect of an immediate settlement of this dispute, which has now reached its fifteenth week. In accordance with a resolution passed at a shop and job delegates' meeting held on Thursday night in last week, the men in thirty more firms were drawn out on Saturday, adding nearly 500 men to those on the United Trades Committee's pay sheets. Of these thirty fresh firms struck, seven, Messrs. Britten, Papin, Stapleton, Summers, Taylor and Co., Whitty, and Winn, have conceded the men's demands. The present state of affairs is that the men have been drawn out or locked out of 265 firms, of which number just 50 have given in to the 47-hours week, and 10d. an hour wage. More than 1,500 men have returned to work, and a large number have left the Metropolis for other towns. A special meeting of the London district of the General Union was held on Tuesday evening at the Old Friends' Hall, St. Martin's-lane, Mr. Barker Sinclair in the chair. It was resolved, after a discussion, on the motion of Mr. C. Matkin, seconded by Mr. Propert, that it was desirable that a compulsory levy of 2s. per member per week should be made on members of the General Union during the continuance of the strike. It was decided to send Mr. C. Matkin as a delegate to the Trades Congress at Newcastle-on-Tyne, and it was further decided to take steps to hold a meeting to discuss the eight-hours movement, with special reference to the present strike.

At the London County Sessions on Monday, Thomas Young pleaded guilty to "following" in connection with the Carpenters' strike, and Richard Arscott, who was convicted on Saturday of "besetting" under similar circumstances, surrendered. In both cases Mr. Bridgman, builder, of Brownlow-mews, Guildford-street, was the prosecutor. Sir P. H. Edlin, addressing the two defendants, denounced their persistent terrorism, said he should postpone sentence for seven days, and bound them over to come up again next Monday. James M'Leary, who had been found guilty of intimidating, besetting, and violence, in the same dispute, was then sentenced to six weeks' hard labour. In consequence of the judgment given in these cases, the members of the London United Trades Committee have decided that they will picket Mr. Bridgman's shop themselves, and not ask others to do it. At the Surrey Sessions last week, Sir Peter Edlin sentenced another carpenter, Alfred Arslon, to five weeks' imprisonment for intimidating one of the new hands employed at Messrs. Patman and Fotheringham's.

EFFECTS OF PICKLING IRON.

THE effect of pickling and rusting on the strength of iron has been shown by A. Ledebur, of Berlin. Rails, joists, and bars were subjected to various conditions—I. In the condition as delivered; II. after exposure for purpose of rusting; III. zincked (galvanised) and tested at once; IV. galvanised and exposed for a time; V. pickled in acid and immediately tested; VI. pickled and kept for a time in a dry place. The pickling was done with sulphuric acid diluted with water in the proportion of 1 : 100. The samples were tested for transverse, tensile, and compressive strains, and under a falling weight, these experiments being made on the same sample for each of the six conditions. The bending tests with wrought-iron joists showed substantially the same for all the conditions, the maximum loads carried showed differences, being highest in the natural condition and lowest when freshly pickled. Rusting also produces a diminution of strength more apparent in the galvanised than in those not galvanised. In the instances where the specimens were broken, the diminution in strength is said to be very decided in the pickled and perceptible in the rusted specimens. The figures are: breaking strain under I. condition, 35 tons; under II. condition, 33·9 tons; under IV. condition, 32·7 tons; under V. condition, 29·6 tons; under VI. condition, 30 tons. The steel specimens showed results which follow the same law.

Mr. John Bottrill, head of the firm of Messrs. Bottrill and Son, builders, Reading, recently entertained some 200 of the workmen in the employ of the firm, and about 30 guests, to a dinner in the old town-hall, in celebration of the marriage of his son, Mr. J. T. Bottrill, with Miss Strange, of Clapham.

Mr. John Willet, civil engineer, died on Saturday morning at his residence in Aberdeen, in his seventy-sixth year. In 1837 he was apprenticed to Mr. James Thomson, C.E., Glasgow, and afterwards became an assistant to Mr. Andrew Thomson. Mr. Willet was subsequently engaged on many Scottish railways, including the Glasgow and Garnkirk, and Pollock and Govan lines. In 1843 he went to Liverpool as an assistant to Messrs. Locke and Errington. During the period he remained there he took a large share in the projection or construction of railways in different parts of the kingdom. In 1849 he became resident engineer on the Aberdeen Railway, which was afterwards amalgamated with the Scottish North-Eastern, subsequently undertaking various works on the Caledonian system.

Engineering Notes.

Leamington.—The opening of the Adelaide-road bridge, built by the Corpor took place on Thursday, the 13th inst. Th bridge, which is constructed of wrought ir built upon the old abutments. These had s down slightly beneath the weight of th bridge, which was some 1,400 tons. The tion of wrought iron has enabled the bo surveyor and engineer (Mr. W. de Norman from whose plans the structure was erect reduce the weight to 250 tons, and to flattened arch, so that the roadway at the is now 4ft. lower than it used to be. The consists of seven wrought-iron ribs, brac gether by double angle-irons in the span and pivoted in the crown and the springin object of this pivoting being that, if th any further settlement in the abutments, th arches may adapt themselves to it witho injurious strains being set up. Above the form of $\frac{3}{8}$in. wrought-iron plates an even s is formed of cement-concrete, and on this the usual macadam roadway. The span bridge is 70ft. The handrailing is of cast Messrs. Jenkins and Son, of Leamington, the contractors for the demolition of th bridge and the alterations to the abutment Mr. Alfred Thorne, of London, was the tractor for the ironwork. The outlay has nearly £2,000.

The Ribble Navigation.—The Ribble N tion Committee's report, issued on Tuesday that the central channel possesses the advantage of being the most direct course Preston to the sea. The rateable val Preston is about £340,000, and the max rate for the Ribble undertaking when the bo ing powers are exhausted will be 2s. 8d. River Ribble Commissioners recommend th tension of the training walls to five miles Lytham, with an additional expenditure f fixed channel to the fourteenth milesto £220,000, or with the equipment of the P dock £281,000.

COMPETITIONS.

Coxlodge Lunatic Asylum.—The Newc on-Tyne Visiting Justices, who manag asylum at Coxlodge, near that city, s Wednesday, and formulated a scheme fo extension of accommodation at that plac new asylum is to be built on the side Gosforth, and will be set apart for male in only. The present premises will be utilis females. The new asylum will accomm between 350 and 400 inmates. The L Commissioners having spoken very high the Nottingham Asylum, a deputatio the Newcastle justices visited the town that institution will form the model by whi justices will be guided in the building oper at Coxlodge. Only architects having pla business in Newcastle can compete. The ju intend to offer premiums for the 2nd, 3r also for the 4th designs, the first comp being only remunerated by the usual comm Mr. G. T. Hine, of Nottingham, the archi the Nottingham Asylum, has been asked as assessor. The cost of the new building from £60,000 to £70,000, exclusive of site.

CHIPS.

Mr. Edward Goodwyn Lewis, a Manc artist of some repute, died last week at Bo mouth in his 65th year. In earlier years h well known as a successful portrait painter, crayons, and at times in oil; but more recen has executed large Scriptural subjects, which exhibited in London and the provinces, and wards engraved.

A new school-chapel, the foundation-st which was laid in November last, was ope Prestwich, Lancs., on Sunday. It is a plain ing, erected at a cost of about £2,000.

At Kelsale, East Suffolk, on the 13th ins parish church was reopened on the comple restoration, which has been in progress in se since 1878, and a new parish room built brick at a cost of £1,300 was opened.

The premises of Messrs. J. Wilson and timber merchants, Bradford, were almost pletely destroyed by fire on Friday. The d is estimated at £20,000.

SOUTH KENSINGTON MUSEUM COMPETITION.

e continue our series of illustrations of this
at competition, which we commenced a fort-
ht since, by giving to-day the exteriors, with
ns, of Mr. T. E. Collcutt's design, and that
mitted by Mr. John Belcher. We shall
tinue the series further next week.

TCHES FROM BELGIUM, ILLUSTRATIVE OF PLACES VISITED BY THE SOCIETY OF ARCHITECTS.

e Society of Architects is this year taking a
e field for its outing, and its members are
ting the ancient cities and towns of Belgium.
o publish to-day a series of architectural
tches from that kingdom in illustration of
buildings seen on the occasion, giving some
racteristic bits from Antwerp, Malines,
ges, and other places, with one or two
lies of old church furniture. The sketches
tributed by Mr. W. H. Thorp, F.R.I.B.A.,
also published in his "Architect's Sketch-
k at Home and Abroad." The illustrations
l fully explain themselves, with the figured
ensions and accompanying particulars printed
h them. Mr. E. Guy Dawber's study of an
confessional at Bruges is specially interest-
. We report the visit elsewhere, which so
has been a most successful one. The Insti-
e of Architects of Belgium has cordially co-
rated, a Royal audience has been accorded to
English visitors, and the Society of Archi-
ts may congratulate itself on the hospitality
l favour with which its members have been
eived as representing one of the leading
glish professional bodies.

TCHES OF UPTON AND NONUPTON COURT-HOUSES, HROPSHIRE, AND OTHER EXAMPLES IN THE EIGHBOURHOOD.

e lithographic illustrations to-day given with
conclusion of our report of the proceedings of
Architectural Association Excursion printed
page 271, furnish views of Upton Court and
nupton Court, two of the most delightful old
ises to be seen in the county, both for colour
l quaint design. Upton Court is not far in a
therly direction from Ludlow, near the
er Teme, in a charmingly pretty country
ards the borders of Herefordshire. It was the
t of the Karvers, and still retains its old glass
l wainscot panelling. Nonupton Court,
v a farmhouse, is a near neighbour on the
er side of the valley. In the centre is a
tty timber porch with Jacobean, almost
tch, brick-built wings and tall chimneys.
h houses, though comparatively unimportant,
certainly eminently suggestive, far more so
than large palatial mansions possibly can be to ordinary architects.

CONVALESCENT HOME, ST. LEONARD'S-ON-SEA.

This building has recently been erected for the Trustees of the Chelsea Hospital for Women. It is situated on the top of the cliff at West Marina, St. Leonard's-on-Sea. The plans given illustrate the general arrangement of the two principal floors. The building is faced with red bricks, Bath stone dressings, and tile hanging, and the roof is covered with brindled Broseley tiles. Mr. Frank H. Humphreys, A.R.I.B.A., of Hastings, was the architect, and the work has been carried out by Messrs. Eldridge and Cruttenden, of St. Leonard's-on-Sea. The cost, exclusive of site and boundary walls, was £3,500. The building was opened on June 3rd by the Countess Cadogan.

CHIPS.

The restoration of the parish church of Hipswell, Yorks, was commenced on Monday. Mr. Harwood, of Manfield, is the contractor.

A stained-glass memorial window has been inserted in the chancel of the Collegiate Church at Stratford-on-Avon in memory of the late Mr. J. O. Halliwell Phillips, the Shakespearian scholar. The subject is that of Elijah's sacrifice on Mount Carmel. The window is situated immediately at the back of Shakespeare's monument, and within a few feet of the poet's grave.

A new mission-room and Sunday-school at Little Bytham, near Peterborough, designed by Mr. R. M. Parkinson, the resident engineer for the Midland Railway Co., and built under the superintendence of Mr. Hayes by Mr. Hammond, builder, of Peterborough, was opened recently.

Miss E. C. I. Abbott, who was the only lady in the 1st Class Natural Science Tripos at Cambridge this year, is the eldest daughter of John O. Abbott, A.R.I.B.A., 31, Charing Cross, W.C.

The models in the competition for the monument of the Emperor William the First are being erected in the Arsenal at Berlin. They will not be exhibited until after the Emperor has arrived there from Kiel, and has himself first inspected them.

With the permission of the trustees of Shakespeare's Birthplace, Mr. C. Bazley, a London architect, has been taking during this week detailed measurements of and about Shakespeare's house for Messrs. Ingram, proprietors of the *Illustrated London News*, who propose to erect an exact facsimile of the building at the Chicago Exhibition.

The Public Works Loan Commissioners, in their report, state that during the financial year 1890-91 they made 481 advances for sums amounting together to £990,068, as against 458 advances for £856,742 in the previous year; an increase of advances in number of 23, and in amount of £133,326.

The Company of Armourers and Braziers will hold, in London, their third exhibition in May, 1892. The exhibits will mainly consist of objects executed in metal from original designs. Particulars as to the prizes offered and conditions of exhibition will shortly be obtainable from the clerk to the Company, 81, Coleman-street, London, E.C.

A series of seven stained-glass windows are being placed in the Jesse Haworth Memorial Church at Walsden, near Bury, Lancs., as memorials of members of the Haworth family.

A selection of 50 representative water-colour drawings by various artists has been presented to South Kensington Museum by the daughters of the late Sir Prescott Hewett. The collection includes one of Sir Prescott's own drawings.

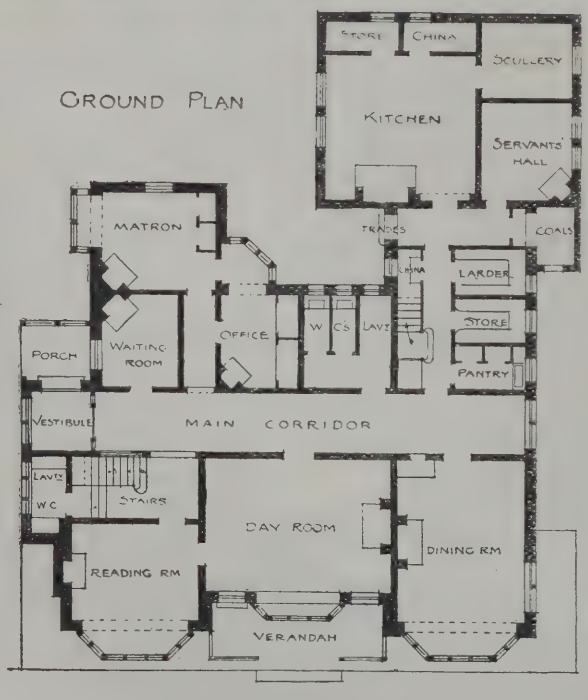
On Wednesday week, the foundation-stones of a new Wesleyan Chapel in Tamworth-street, Lichfield, were laid. The chapel is being erected from the designs of Mr. Thomas Guest, Birmingham, and is to be in the Perpendicular style, with alterations to the old building, which is to be utilised as a school hereafter. The expenditure involved is about £2,000. The contractor is Mr. Williams, of Tamworth.

The new schools which have been erected by the Rowley Regis School Board at Macefields, Old Hill, were opened on Monday. The total cost of the buildings, exclusive of the site, is £3,500, and accommodation is provided for 460 boys. The schools are built upon the principle of grouping all the class-rooms round the central hall, so as to give every class-room a side light to the desks. They are built of red bricks and terracotta, with Broseley tiles on the roof. All the floors are laid with solid oak blocks, excepting the porches, which are of asphalte. Mr. W. Willetts, contractor, of Old Hill, was the builder, and Mr. J. T. Meredith, of Kidderminster, the architect.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

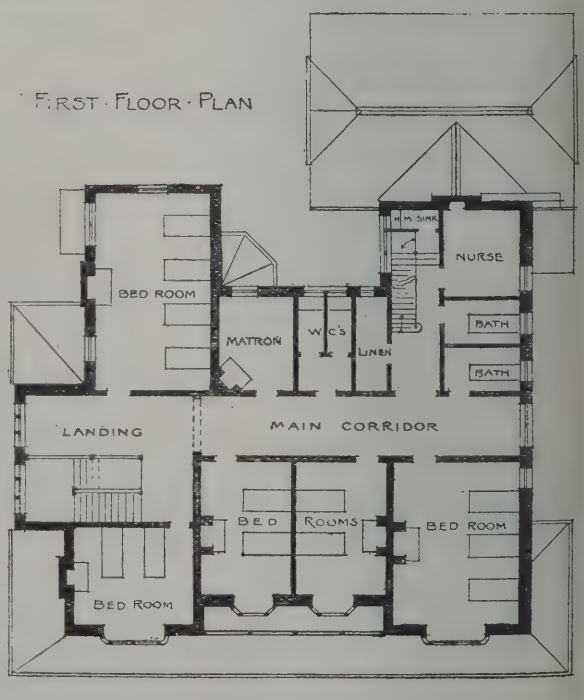
British Archæological Association.—The 48th annual congress of this body is being held this week at York. The proceedings of the congress began on Monday, when a welcome was extended to the members of the association on behalf of the city in the Guildhall. The Marquis of Ripon, the president for the year, in responding, remarked that to studies like archæology was greatly due their better understanding of the past. If there was any distinction more than another between the present day and the 18th century, it was to be found in the greater and juster understanding of past times, and especially of the middle ages. If there ever was a country in which archæological studies might well be zealously pursued, that country was our own, because it was the singular fortune of England that her people had had no violent severance of their history. Votes of thanks were passed, and subsequently visits were paid to the King's Manor and the Minster. In the evening the members were invited to a *conversazione*. On Tuesday visits were paid in the morning to the ruins of St. Mary's Abbey and the Museum of the Yorkshire Philosophical Society, which occupies a portion of the grounds attached to the Abbey. In the afternoon the Castle and several of the city churches were inspected. On Wednesday, the members visited Knaresborough Castle and Church, the "Devil's Arrows" at Boroughbridge, and the Church and Roman Pavements at Aldborough.

Royal Archæological Institute.—In completion of our report of the Congress at Edinburgh, from our last issue, p. 240, it may be mentioned that the annual meeting was held on Thursday, after which the Bishop of Carlisle opened the Architectural Section with an address. On Friday the members visited St. Andrews and were conducted through the University, the ruins of the cathedral, the castle, and other places of interest. On Saturday a visit was paid to Glasgow, where Mr. John Honeyman, architect, acted as guide over the Cathedral, and the Wall of Antoninus was inspected in the section between Cury and Dellatur, Mr. W. Jolly being the leader. On Monday Mr. Thomas Ross, of Edinburgh, conducted a large party over Rosslyn Chapel, Borthwick Castle and Church, and Crichton Castle and Church. In the evening the concluding meeting was held in the National Scottish Portrait Gallery.



York Architectural Association.—On Saturday afternoon the members of this association visited Driffield, the object being to inspect some of the restored ancient churches in the neighbourhood. The party first viewed the church at the village of Kirkburn, restored several years ago. The Transitional Early English church of Garton-on-the-Wolds, decorated by Sir Tatton Sykes, was also visited. St. Peter's, at Little Driffield, which has recently been restored under the superintendence of Mr. Temple-Moore, of London, was next seen. During the restoration many interesting discoveries were made, notably the capitals and bases of pillars show that at one time a church stood here having both north and south aisles. These were found in lowering the floor to the depth of about 4ft. On leaving Little Driffield, the splendid Perpendicular tower of All Saints, Driffield, soon came into view, and was at once pronounced to be a fine specimen of this style of architecture, the beauty of its proportion being almost unique among the towers of parish churches, as it resembles the towers of the Cathedral of York and the Minster of Beverley.

The Hyde Park recreation club in Ashgrove, Headingley, was opened by the Mayor of Leeds on Friday. The club has cost £3,000, and has been built from designs by Mr. W. A. Hobson, Albion-street, Leeds. The principal apartment is the assembly room on the first floor, which measures 55ft. by 24ft. 6in. The contractor for brick and stone work was Mr. W. Evans, of Leeds, and the contracts for carpenters' and joiners' work were taken by Messrs. J. Ledgard and Son, of Leeds.



A stained-glass window was last week placed in one of the north lancet lights of the nave of Clymping Church, by Mr. Henry Bransbury, of Southsea, in memory of his parents, brothers, and sisters, who lie in the churchyard adjoining. It is a representation of the "Good Shepherd," manufactured by Messrs. Holt, Warwick, and put in by Mr. James Gibbs, of Littlehampton.

SKETCHES ILLUSTRATING THE VISIT OF THE SOCIETY OF ARCHITECTS TO BELGIUM.

(See also Lithographic Illustrations.)

WAYSIDE NOTES.

THIS is pre-eminently the season for archæological wanderings, and, if we may include holiday-making architects, the sum-total of persons engaged in inspecting old buildings must amount to something rather considerable. Like to other sciences, however, is that of archæology. New discoveries are mostly made in a more or less chance way. Accordingly we find that large numbers of specialists roaming about the country never alight upon anything novel; but that Roman villas and bath remains, such as the new finds at Lincoln and in Hampshire, are the result of what is called "chance." Of course, the Oldbuck, the architect, and the student do not go a-grubbing with pick and shovel like the excavator and navvy, and, therefore, cannot be expected to unearth classical or any other remains; but reading the reports of the doings of this and that archæological society and the excursions of architectural bodies, it did just occur to me to contrast all this apparent wealth of systematic researches with the chance nature of actual discoveries.

The Royal Archæological Institue of Great Britain and Ireland has apparently had a good time over the Border, in spite of the taste of the "Scotch mist" that the members of the Institute's excursion party had on Monday last. The session of the Institute was brought to a close with a meeting in the National Portrait Gallery at Edinburgh. According to a statement of the chairman of this meeting, the national monuments, churches, towers, &c., are well cared for in Scotland. Only one little matter called for criticism, and here the R.A.I. descended to that consideration of trifles which seems to be unavoidably an attribute of archæological societies of all grades, royal and otherwise. A "great quantity of vegetation" has been permitted to grow on the roof of Borthwick Castle, "doing great injury to the interesting ruin." I dare say this veritable market-garden on the roof of the castle doesn't do a great deal of injury, and doubtless aids the picturesque; but it apparently caused animated discussion at the Institute's meeting, and the adoption of a motion that steps be taken to have the "vegetation" removed!

The British Archæological Association is holding its forty-eighth Congress at York, and is having a busy time in exploring the manifold remains of that venerable city, what with the Minster, churches, abbeys, museums, and the Castle. The president for the year is the Marquess of Ripon, who at the opening of the congress delivered an inaugural address by no means void of interest. It is indeed true that "to studies like archæology is greatly due our better understanding of the past," and that "any science which enables men to appreciate what has gone before them, and out of which their own times have come, must have a very valuable teaching, not only for men of science, but for public men, politicians, and statesmen." History, studied conjointly with architecture or archæology, is infinitely more useful and interesting than when studied by itself. Someone has called architecture "frozen music." Archæology, perhaps, is, in a sense, *frozen history*. Ancient buildings are certainly "history in stone," as an old friend of mine used frequently to say.

It is taking a wonderfully long time to turn Norwich Castle into a museum. Years ago the idea of utilising the Keep and the prison buildings for museum purposes was definitely decided. That was some time before I last visited the town, one Easter, two years ago. At that time I remember there were about "two men and a boy" at work in the Keep, among such a maze of loosened masonry, dry rubbish, &c., as made me think that these worthy Norwich workers would labour till Doomsday, and not get things in order. I judge, however, from a letter by Lord Walsingham in Monday's *Times*, that matters have progressed, and that now donors and benefactors are wanted to fit up the various buildings round the Keep as museum galleries. In Lord Walsingham's letter it is stated that anyone who contributes £1,000—which will be about sufficient to complete and fit up one of the subsidiary buildings as a museum—will have the honour of having his name associated with the building, and a hope is expressed that any Norwich citizens or any East-Anglians, for the matter of that, who may have gone across the high seas and made their goodly piles, will thus contribute to the cost of founding the museum—a hope I sincerely re-echo as an ardent admirer of Norwich and its inhabitants.

I am glad to hear that the rumour that old Burghley House, the Elizabethan mansion of the Marquis of Exeter, with extensive surrounding estates, would be shortly offered for sale, is unfounded. Lord Tennyson's "Burghley House by Stamford Town" may be familiar to readers. Built by Queen Elizabeth's Lord Treasurer, a commencement with the works was made in 1575, and when complete the "Virgin Queen" herself visited the Lord Treasurer. Our own Queen has also visited the old mansion, which has great historic interest, and is certainly not a fit subject for the hammer of the auctioneer, although of late years the "going, going, gone!" of the salesman has sounded harsh and grating in many an old historic room and hall hallowed by a long train of memories of the past.

Taffy is still a Welshman—I won't say a thief; but the children of the Cymri who compose the Caerleon Highway Board evidently have no disinclination to steal brains when they get the opportunity. Here's a chance for district surveyors! One of these lucky sons of Cœsus on the 3rd of September will become

"DISTRICT SURVEYOR for the said Highways, comprising the Parishes of Llandegveth, Llangattock, Llangibby, Llanvrechva Lower, Llanthewy Vach, Llanhennock, and Tredunnock. The person appointed will be required to have a thoroughly practical knowledge of the work, such as preparing and examining plans, specifications, and estimates of costs of Works, making and repairing of Roads, Bridges, management of refuse disposal, scavenging, &c. He will also be required to undertake the supervision of labour, payment of wages, and keeping books and accounts connected with the office of Surveyor, and to perform all duties required in respect of such office under the Highway Act and the Orders of the Local Government Board. Salary, £52 per annum."

He will probably make his living—as all such miserably-paid officials must—out of illicit commissions; but that probably will not trouble the sapient Highwaymen of Cærleon so long as they can point with honest pride to their pound-a-week D. S.?

If the Society of Architects are not having a good time in Belgium it will not be the fault of arrangements, nor the want of a well-considered programme. They have a most interesting field to explore—no better could be found for those who have never been to Belgium; they have been accorded the audience of a king, and, on the whole, the weather has not been at all bad. One and all should return to England, and work happier, more informed, and richer in architectural ideas than when they set out for the Low Countries. I know of no district in Europe that has supplied a larger store of useful information to the architect than Belgium, and if we include Holland, we have a tract of country that has been a storehouse whence ideas have been drawn for at least one-fourth of the architectural designing of the past eight or nine years. Before the era of terracotta, which is *fin de siècle* architecture indeed, bricks and brickwork were the rage; and where so instructive a country for examples of beautiful and architectural brickwork as the "Pays Bas"? Terracotta is daily becoming more used for urban elevations than the once ubiquitous red-brick; but the lessons of what may be called the "Brick Revival" are too deep and sincere to be dropped entirely, so that brick architecture will be always practised, and the countries of brick architecture be always revered and gratefully esteemed by the architect.

I fear that you get, at this time of the year, rather a surfeit of archæological matter in your columns, not from the point of view of the reader, however, who, curiously enough, at a season when he may himself have been "archæologising," finds archæology and accounts of touring architects a palatable item in the weekly bill-of-fare. Your account of the excursion of the Architectural Association must prove interesting reading to all, as will also the doings of the Society in Belgium. The architecture of Shropshire lacks nothing in interest when compared with that of other counties. Those unacquainted with the district traversed by the A.A. excursionists may think that it does; but the account and illustrations given complet abuse our minds.

When holiday-makers return they work ready for them in the competi There is now quite a batch of competi hand. Of the most recent ones, that Wavertree Local Board may be dismis the mind of the architectural competitor, to the care of decorative specialists. police offices for Shrewsbury afford an opp to those acquainted with the peculiar ex of buildings of this nature. The particul forth in the advertisement are perhaps they might be; intending competitors sh deavour to have an assessor appointed, at once. These matters can always be torily arranged, if taken up in good time when delayed till the drawings are sent usual heartburnings and other attendant of the unsatisfactory, assessorless con come to pass. It only needs a few arch write to the inaugurators, when, if thes men mean well, they will generally agre appointment of a referee.

The Bath Competition promises wel premiums are substantial, and a wel architect has been appointed assessor. ought to be some possibility of forecas probable style of the building. *Bath-st* of course, be employed, and I have a no the views of many of the competitors as will, for sufficient reasons, be tinged wit of the Palladian. Thus, I should say probable style of the proposed new b buildings at Bath will be represented formula:—$\frac{\text{Bathstone}^2 + \text{Palladio}^3}{\text{Modern ideas}}$. T not convey any very lucid notion to read it does to myself, and as I fancy I mu of only about half-a-dozen architects not making at the present time, it perhaps matter. Anyhow, intending competit have the solution of the formula on appl accompanied by a fee of two guineas, re of course, on receipt of a *bonâ fide* desig —to the Ancient

CHIPS.

The Works Committee of Aberdeen Board have adopted a plan by the harbour showing an extension of the existing fish the graving dock, a distance of nearly 5 cost of £3,400.

The work of reroofing the chancel of M Cathedral, under the direction of the architect, Mr. J. S. Crowther, is now show siderable progress. Four bays out of s chancel have already been covered in.

Memorial-stones of a new Wesleyan Ch laid at Denaby Main on Monday. The ch cost about £1,500, and to accommodate 50 Mr. Arnold, of Doncaster, is the builder.

The foundation-stone of the new buildings at Sheffield (which, including cost altogether about £150,000) is to be l Mayor (Ald. Clegg) on the 23rd prox. M Mountford, F.R.I.B.A., of London, who was accepted in competition, and has b trated in our pages, is the architect.

A reredos of carved oak is being mad parish church of Madron, near Penzanc Harry Hems, of Exeter.

New banking premises are about to Keighley, for a Bradford firm of bank plans by Messrs. W. and J. B. Bailey, of and Keighley.

Memorial-stones of new Sunday-sch nected with the Anfield Wesleyan Cha field-road, Liverpool, were laid on Col. C. O. Ellison, M.S.A., of Liverpo architect of the buildings, which will cost

At the last meeting of the Town Counci gow, Bailie McLennan announced that th the new municipal buildings, erected William Young's designs, had been co lower than the estimates. He was not, ho a position to state the exact amounts.

Mr. F. G. Saunders, presiding at the h meeting of the Great Western Railway C incidentally referred to the subject of iro over railway lines. He said that Br original engineer of the Great Western, ferred wrought to cast iron, and the com departed from that system in very fe Wrought iron would now be employe instances.

HITECTURAL ASSOCIATION EXCURSION IN SHROPSHIRE.—No. III.

WITH LITHOGRAPHIC ILLUSTRATION.

NTINUING our itinerary with this Society during last week's excursion to buildings terests in the neighbourhood of Shrewsbury, have arrived, after a charming drive on nesday morning, and a short walk over the , at the quaint old farmhouse known as *ght Hussey Manor*, the home for genera- of the Husseys and the Corbets. It is of styles of building in picturesque contrast. half-timbered wing was built about 1524, he stone additions belong to the end of the ry. In one of the panelled rooms an oak iption is to be seen to the effect that it was de by me, Edward Huse, 1601." The ing was once moated, and the old bridge forms the approach. The detail of the er work in parts is very rich, and although wo parts adjoin rather than combine with other, there is an odd grace about the old ling which furnishes attractions sugges- to the artist. On the Wem-road is efield, where the Percies met Henry IV., were routed by him "in a trice," amden says, for the King was well ured for the attack, having made Shrews- specially strong. The excursionists walked this memorable site, and, passing along al meadows, reached the Collegiate Church ttlefield, restored by Mr. Pounteney Smith 62. It has a bold, handsome western tower, h is as wide as the aisleless nave and ancient cel. The former was gone, and Mr. Smith lified it and built a prettily-designed vestry ecorated Gothic, filling the windows with emnants of ancient glass of crude design. side windows of the church are large, and 14th-century traceries. The east end of church is also handsome, making the build- quite worth seeing. Inside Mr. Smith has nothing to excite one's admiration, while the stic tiles over the entire floor all on one show an expanse of vulgarity quite out of d with the spirit of old work. The absence step at the west end is most marked. The n-gate is Jacobean in date, with rich ngs and arched pieces, moulded posts and sters, square on plan and roofed in tiles. We do emember to have seen one like it anywhere. inuing the drive for some four or five miles yard, Strawbury Church was seen, where is a Saxon font and old glass in the choir, hen a mile or so away *Moreton Corbet*, a vast of two houses, the last—like the buildings of homas Tresham in Northamptonshire, with h it is contemporary—having never been ned. Sir Richard Corbet is recorded as the er, having brought the designs, or more ably his ideas concerning the style of his ided mansion, from Italy. Some of the nal drafts for the details of the building still , or did exist a few years ago, in the possession e family. Over the porch of the old house is nscription "S.A.C. 1576-78," also "I.R.C.," the crest of the elephant and castle. first initials refer to Sir Andrew Corbet. son, Robert Corbet, "Dyed of the plage." building was erected, as far as it went, about end of the 16th, or commencement of the century. In 1644 the house was garrisoned 'arliament, and sustained great injury. The s and shaped gables standing windowless, weird enough, and desolate; but some of detail is very crisp and fresh-looking, a specimen truly of the English Renaissance, gh not named in Mr. Wyatt Papworth's l chronological list of such remains. We last week a view of one end, showing one e most complete parts of the house. There crudeness about the detail, and it shows nt of thought on the part of the designer h is very remarkable, seeing how bold original the general treatment of the front must have been, judging from what remains. It would be an admirable thing to ss a properly-restored elevation of the main le drawn out, and we understand that exca- ns are shortly to be made with a view to ining a correct plan. Several hours were spent here. The church hard by is well , and makes a pretty picture in the trees, to the architect, is devoid of interest.

he ruins of *Haughmond Abbey*, standing near pot where Lord Douglas fell and was crushed is charger after the battle of Shrewsbury, he last place seen on Wednesday. To recount the chequered history of this Augustinian Monastery, and tell its privileges from Popes and other benefactors, such as King Henry II., in whose days the establishment was very powerful, and prospered till the Dissolution, when it passed to the Littletons of Pilaton Hall, to the Barker's, Kynaston's, and the Corbet's would occupy more space than can be afforded us. The church has nearly entirely gone; but the remains of the monastic buildings are very considerable still, and very beautiful. The cloisters on the south side of the church and the square chapter-house, a grand example of Transitional work, has a noble entrance of three round arches, windows being placed in the side openings. The effect is very similar to the rich Charente churches, and statues stand between the shafts of the jambs, as in Rochester Cathedral great doorway. They are evidently, however, of the 14th century date, with canopies over them. The locutory, or day room, is situated to the south of the chapter-house; and on the south side of the cloister, extending westward, is the refectory, with fine Decorated work about it. The Abbot's House and Guest Hall are interesting—the latter a remarkably handsome hall, lighted by large Decorated windows, and measuring 81ft. long. It has a big fireplace, and a newel staircase in one corner leads above. The 15th-century stone-built and gabled building called the Monk's Well is a curious vaulted little structure, to the rear of the chapter-house. After an early visit to the grand Church of St. Mary at Shrewsbury, Thursday's programme was entirely devoted to the delightful castle at *Stokesay*, and *Ludlow*, with its great church and castle, the Feathers Hotel, and other old timber houses, such as the Reader's House in the churchyard, and Ludford House, over the bridge, at the foot of Market-street. The journey, of course, was accomplished by railway to these two centres of interest. In the BUILDING NEWS for the 7th inst. we gave some views and a plan of Stokesay Castle, with a full description of the building, so that further remark here is unnecessary. Last week we published a view and plan of Ludlow Castle, and an account of its history, leaving nothing to be added now about the ruin. The parish church, dedicated to St. Lawrence, is a famous building ranking among the noblest examples of its class in the country both for its cathedral-like proportions and exquisite richness of its detail. The great central tower at the crossing, over which it forms a lantern, has just been recast by Mr. Thompson, the builder, of Peterborough, under the direction of Sir Arthur Blomfield, A.R.A., who is now restoring the chapel south of the choir. Sir Gilbert Scott did a considerable amount of repair to the building about thirty years ago, but we notice that one of the windows which he inserted in the hexagonal porch on the south of the nave is in its turn already commencing to split and perish. The choir stalls, with their quaint old misereres grotesquely carved with comical sculptures, the restored reredos over the high altar, the ancient and new glass, the tombs, and the screen and woodwork to the north chapel of the choir—are all features worthy of the architect's attention. The large classical organ-case inclosing the beautiful instrument by Schweuzer should be mentioned.

The new Jubilee Market Hall lately completed at Ludlow, is a "terror," and, whoever the architect may be, it is far from cheerful to realise that such coarse, vulgar, ill-designed work should be carried out in such a town for such an object and at such expense. The new premises in Market-street for Lloyd's Bank seem to bear the impress of the same crude hand, though the façade is a trifle less objectionable. As to the Feathers Hotel, it hardly deserves its fame, speaking architecturally, for the detail is anything but refined, and much of its outside elaboration is sham. The ceiling in the room upstairs is a handsome specimen of good plasterwork. The chimney-pieces came from Ludlow Castle, and we illustrated them last week. Mr. Thomas Yates read a description of the castle to the excursionists previous to lunch being served at "The Feathers."

Friday proved to be one of the most enjoyable days' of the week, and the weather throughout, though showery at times, was on the whole conducive to the pleasure of the outing. After about an hour's drive from Shrewsbury through a well-wooded and charming country, the party reached *Pitchford Hall*, a large rambling timber and plaster-built house, situated in a well-watered hollow. It forms three sides of a square with kitchen offices beyond, giving the plan of the letter F. The many-gabled pile has a picturesque skyline enriched with characteristic brick chimneys. In Leake and Evans's "Castles and Old Mansions of Shropshire," published at Shrewsbury some years ago, the late Mrs. Stackhouse Acton gave some rough studies of the house, but we remember no others being issued. A mill, the frequent adjunct of our old manor-houses, stood in the narrow deep declivity which comes between the hall and the churchyard. The Queen stayed at Pitchford Hall in 1832, the guest of the Earl of Liverpool, with the Duchess of Kent. The bituminous spring in the village gave the place its name. It was renowned for its "water like tarr, skim'd together like soft wax, it becomes more medicinall then other pitch." Marmaduke Rawdon in his 17th-century tour is thus quoted, and he adds: "In the Holy Land there are some springs that cast up a bitumus stuffe like this." Colonel Coates owns the mansion, which contains a large assemblage of rare Jacobean and other old furniture. The late Mr. Devy, the architect, did a good bit to improve the interior, and his work, as might be expected, is in harmony with the old work and in good taste. The building is entirely in "magpie" work, but the blacking of the timbers gives it a hard effect, so different from the silvery colour of old oak, as at Stokesay Castle. The summer-house in the lime-tree to the rear of the house is curious, and is shown as one of the features of the place. Altogether this visit was much appreciated. There is a curious effigy in oak in the church to one of the Pychfords, who is represented as a Crusader; otherwise there is nothing worthy of note in the building. The hospitality experienced in Shropshire by the associationists was marked by its complete absence, save in one instance—viz., Benthall Hall, where Mr. Bateman, who resides there, did indeed pull some lettuces, and give them to his brother architects unwashed, so that the Salopian salad was bestowed on the cattle. In Condover Hall there is every luxury. The chimneypieces, in fine Italian sculpture, are rich in material and colour. In the dining-room the cove over the hearth is in specially-made Doulton ware. The hall has a magnificent modern arched screen of florid design, and the great staircase, also new, has much good detail about it, though, for some reason or other, it is not satisfactory. The grotesque carved apes, painted and gilded, on the newels, are cleverly done, if somewhat out of place. Captain Cholmondeley informed his visitors that these beasts are to be removed and plain balls substituted. This we think a pity. No such alteration will ever make the staircase look like an old one, and these apes are certainly both characteristic and well cut. On the first floor there is a small narrow picture gallery with two pretty stone and marble chimneypieces, which look original. The principal porch bay is the best part of the entrance front, and the arcaded centre to the garden front, with the pedimented row of gables to the mezzanine floors over the arches, is an unusual and effective feature. The lead rainwater heads to the house are handsome 17th-century specimens. The church has been almost rebuilt. It has a noble western tower and a very wide nave without aisles. The new roof is an arched spandrel one, based, it seems, on the old one. The choir has new stalls, altar, and fittings. The vestry shows the same good taste, and some of the new work indicates the hand of a master such as the late Eden Nesfield or Mr. Norman Shaw. In the chapel north of the choir is some fine modern sculpture, the work of the present Squire Cholmondeley, who evidently is no mean artist. The altar tomb to his wife and child is a beautiful work, with good detail in the panels of the lower part, and the kneeling statue of his brother, sword in hand, is a successful attempt at sepulchral sculpture in harmony with church feeling and present day surroundings. The Jacobean half-timber gable of the south transept is, perhaps, the most remarkable part of the fabric. We gave a detailed sketch of it in our pages for the 7th inst. The excursionists held their final dinner at the George Hotel on Friday evening, when the usual toasts were honoured, and convivialities were continued to a late hour. Mr. Fox, of the George Hotel, spared no endeavour to secure the comfort of his visitors, and Mr. C. Wellard, the hon. quartermaster, again acted in his old capacity to the advantage

of everybody. On Saturday the party who remained in Shrewsbury visited the Abbey Church, where Mr. J. L. Pearson, R.A., has just built a beautiful chancel in an early and bold style, erecting a triptych elaborate in gold and colour. The western tower has been restored; but the nave has still to be reroofed. The Grammar School, now used as a Free Library and Museum, was also seen, the old market-hall, and Hill's Mansion—a most picturesque brick house, with a richly-treated stone bay and other features. The building is now used as a warehouse, and the timber-built part as a public tavern and a "doss" house. Next week we shall give another sheet of sketches from the neighbourhood of Ludlow.

Acton Burnell, the site of the next halt, is best known for its celebrated castle; but the church, close by, will perhaps call for the prime attention of the professional architect. It has a singularly beautiful Early English chancel, of elegant detail. The Geometrical east window figures, if we remember correctly, in Parker's "Glossary of Architecture." The building has lately been restored, and the restorer has inserted new cuspings in the rose centre. These on the exterior look too thin; inside they are more satisfactory. The seatings of the church have old pewings, cleverly worked in. Why any one who has shown so much good taste in other respects should use sham iron hinge-plates, and hang his doors with butts, we cannot understand. The fraud is evident to the visitor immediately on entering the building. The north tower, over the vestry, seems new; anyway, it is extremely pretty, and we like it much. It reminds one, in a general way, of the late G. E. Street's central tower in his design for St. Mary's Cathedral, Edinburgh. The alabaster and stone tombs in the north transept (1591), as well as the perfect brass of earlier date, are particularly interesting and suggestive. The E. E. font is an unusual example. The ruined Edwardian "Castle" of Acton Burnell, designed by the same hand as the Bishop's Palace at Wells, is a parallelogram on plan, the four corners being emphasised by square towers with very thick walls. The hall, on the north side, had large transomed windows, and for richness of colour and beauty of surroundings the water-colour artist need desire no more fitting subject for his pencil. Here Edward I. assembled his Parliament in 1283, while the Commons met in the barn hard by; but the fabric of this ancient Parliament House is now entirely gone save two gables, and the present castle was not really commenced till two years after this celebrated occasion. Bishop Brunell of Bath and Wells, Chancellor of England in 1292, built the present castle, and was engaged by his royal pupil to manage the marches of Wales.

The concluding visit of the day comprised *Condover Hall* and church, which were next seen. The house, erected in 1598 by Judge Owen, is a fine Elizabethan mansion of considerable extent, and built in a handsome local red stone is in sunlight rich in colour, which adds to its interest. The present occupier, Captain Cholmondeley, is to be congratulated on the exquisite care with which the house and gardens are maintained; but it cannot be said that the visitors received more than scant courtesy at his hands.

MASONRY AND STONE-CUTTING.*

By Lawrence Harvey.

(Thirty-Fourth Lesson.)

ST. GILES' SCREW, OR CORKSCREW VAULT.

I HOPE I shall be pardoned the homely English title I give to this vault in favour of its clearness. The surface of this vault is identical in character with some of our old-corkscrews, the thread of which was of circular section. It is formed by the spiral motion of the semicircular arch A′ M′ B′ (Fig. 236). The object of this structure is to form a vault on which the steps of stairs shall rest. This offers the great practical advantage over the dancing and circular stairs of Lessons 32 and 33, that here the steps, being independent of the structure, can be changed whenever required, whereas when the steps form a constructional part of the structure, they have to be patched with pieces let in when worn down, and remain for ever afterwards unsightly.

As the vault has to follow the rake of the steps, begin by drawing the steps according to formula given in the thirtieth lesson, the treading line 1, 2, 3 . . . (Fig. 235) being at 1ft. 7in. from the face of the solid newel. Then every point, such as L′ or M′ of the generating face-arch, will describe in its motion a helix with the same rise as that of the steps above. To draw the elevation of the helix described by the point L′, for instance, mark the heights of 12 risers on a slip of paper, and pin the slip on your drawing with its lowest division at the level of L′; the other divisons will give you points of the helix where L′ has come over the lines 0 1, 0 2, 0 3, . . . &c. (Fig. 235), of the risers. The plan of the helix is the circle of radius O L (Fig. 235). By placing the lowest division of the slip of paper at the level of every other point of interest in the arch, the joints, the mid-points, &c., the helixes described by these points are easily drawn.

Now the joints L′R′, M′P′ of the face-arch will describe surfaces similar to those of a screw with triangular thread; these surfaces will be the bed-joints of the vault. It is to be noted that the joint lines L′R′, M′P′ are not normal to the soffit of the vault, for the normal should be normal to the helix; but they are found to be near enough to the normals for practical purposes.

The back of the vault is the helicoid described by the motion of the horizontal line which forms the upper part of the arch stones on section.

To divide the course engendered by the pentagon L′ M′ P′ Q′ R′ in a number of arch stones, cut that course by planes normal to the helix described by the mid-point D′ of the arc L′ M′.

As all the arch stones of the same course are identical, it is sufficient to draw one only. Let the joint planes be taken through the points $d\,d'$, $d_2\,d''$ on the medium helix D′ δ' D″, D δ D_2, at an equal distance from the ray O δ, which is perpendicular to the elevation plane.

To determine the joint plane through the point $d\,d'$, draw the plan and elevation of the tangent to the helix in $d\,d'$; let the subtangent $d\,t$ be equal to three divisions of the circle D d; then the elevation will be $d'\,t'$, in which t' will be at a level of three steps below d'.

Now the joint plane is normal to the tangent drawn, and its intersections with the five faces of the arch stone have to be found. The readiest way of delineating these intersections is to slide the plane up the helix, as if it were up the thread of a corkscrew, and bring it up to the point $\delta\,\delta'$, where it will be perpendicular to the elevation plane, and be entirely projected on the line $u'\,v'$, drawn at right angles with the tangent $\delta'\,\theta'$. Then mark the points $\lambda'\,\delta'\,\mu'\,\pi'$, . . . where the trace $u'\,v'$ meets the arrises of the arch stones, and also intermediary helices taken through the mid points of the sides M′P′, P′Q′, . . . ; and then find the projections of all these points on the plan; you will be able to draw through them the horizontal projection $\lambda\,\delta\,\mu\,\pi\,\chi\,\rho$ of the section of the stone by the joint plane. This done, you must slide back the joint plane to its former position. This means redrawing the section in l, d, m, p, . . . where the points are at the same distance from the ray $o\,d$ as the former points were from $o\,\delta$. Having the plan of the section, the elevation is readily found.

By a similar operation the joint is drawn at the upper end of the stone, and the whole of the arch-stone is entirely delineated. Now the stone prism from which this arch-stone is to be taken is comprised within two vertical planes $g\,h_2$, $f\,e_2$, perpendicular to the ray O δ; two planes perpendicular to the preceding, and with their vertical traces $g'\,g''$, $h'\,h''$ parallel, and inclosing as near as possible the elevation of the arch-stone; and, lastly, the planes which form the end joints of the arch-stone. These last planes will cut the others along the parallelograms $e\,f\,g\,h$, $e'\,f'\,g'\,h'$ and $e_2 f_2 g_2 h_2$, $e''\,f''\,g''\,h''$, which are constructed as follows: Imagine through the point d and in the joint plane a horizontal line projected on plan $o\,a\,d\,b$ and on elevation in $a'\,d'\,b'$; this horizontal line will meet the vertical planes ff_2, gg_2 of the stone prism in the points $a\,a'$, $b\,b'$; then, through these points draw $e'\,f'$ and $g'\,h'$ perpendicular to the tangent $d'\,t'$, and these will be the sections of the front and back face of the prism with the joint plane. Project then the points $e'\,f'\,g'\,h'$ on the horizontal plane, and you have the parallelogram $e\,f\,g\,h$. The other parallelogram, $e_2\,f_2\,g_2\,h_2$, is constructed in the same way.

To work the stone, the exact shape of these ends of the prism are required with the section of the joint which they contain. To do this, again slide the joints to the position $u'\,v'$, where w delineated the section. You may do it b drawing on plan the end parallelogram in ε and then projecting these points in the eleva on the line $u'\,v'$. But it will be found tha vertical lines of projection meet the line $u'\,v'$ u too sharp an angle to be able to determine rately the position of the points on the eleva It is therefore much safer to consider that point has, in sliding upwards, risen the heig three steps, and place it at that level on above its former position. The same oper should be repeated for the other joint p which will be slid down to $u'\,v'$.

Now, to find the real shape of both these planes, twist the plane round ($u'\,v'$, $\delta\,\theta$) so bring it parallel to the elevation. This dra has been produced in Fig. 238 by transpo $u'\,v'$ parallel to itself in $u_3\,v_3$. After twi the plane, the points will be on lines sta from λ', δ', μ', . . . and at right angles with their distances from $u'\,v'$ will be equal to distances from $\delta\,\theta$ on the plan. It is to be n that in Fig. 238 we have one section of the a stone only, for the section is the same everyw for the same course of stones; but, on the o hand, the two sections of the containing p differ, and therefore the Fig. 238 gives us moulds.

To get the arch stone, it is necessary to w out of the operation prism an operation heli generated by the rectangle Q′X′Y Z′ (Fig. 2 like the string of an ordinary circular stairs open well-hole. The intersection of that by the joint plane is the curvilinear quadrila $x_3\,y_3\,z_3\,\chi_3$ (Fig. 238), of which the two $y_3 z_3$ and $x_3\chi_3$ are arcs of ellipses. It is noted that the upper and lower planes of operation prism must be selected so as to c prise within them the operation helicoid. the intersections of the upper and lower fa the operation prism with the cylindrical out and inner side of the operation helicoid ha be found as shown (Fig. 239).

Working of the Stone (Fig. 240).—Begi working the operation prism exactly as d in Figs. 235 and 237, and delineate on the j planes the sections both of the arch stone and operation helicoid by means of moulds t from Fig. 238. Then apply on the upper lower faces of the prism of the mould t from Fig. 239, and work from these the cylindrical surfaces of the opera helicoid. By placing a flexible straight on the cylindrical sides, the helixes w guide the upper and the lower planes the operation helicoid will be delineated, these surfaces can be worked. Then every of the arch stone can be delineated: those w are on the cylindrical surfaces by means flexible straightedge; those on the upper lower surfaces by means of a trammel. working of the surfaces of the stone betw these lines is then an easy matter, provided guiding marks taken from Fig. 239 have preserved on the surfaces of operation until completion of the stone.

The springers belong on the one side to wall, and on the other to the newel (Fig. The newel will therefore bear the thread screw (Fig. 243), which will be cut by the pl of the horizontal joints along two curves, and K $i''\,w$ (Fig. 235), constructed as follow profile S′N′B′ of the springer (Fig. 236) is by the joint-plane S′S″ in the point (S′, B); when the profile has slided upwards the heig two steps, the point i of the profile will risen up to the joint-plane, and its positio the plan will be on arris of step 2 in i''; an the difference of level between N′ and S′ be, $\frac{3}{4}$ of a riser, then N will have reached on pla the arc N K being equal to three-quarters o tread on that line. The same constructi applicable to finding the section of the surfa the bed-joint. As this last surface migh continued to the centre line, the curve of i section, if prolonged, would pass through centre as shown.

The Square St. Giles' Screw (Fig. 244).—A drawing the plan of the steps as shown, a s ellipse is placed on the diagonals forming angles, and at the level given by the steps. jointing is then drawn on plan as shown, an points where the joints meet the diagonal projected on the groins above; the joints an the generators of the vault are straight and a skew surface. The bed-joints may be pl through the arrises of the joint lines on the and the joint lines of the section A′M′N′P′

Before closing this lesson, I beg to call attention to two examples of the circular St. Giles' screw to be seen in London. The one is a quadrant of the vaulting which supports the steps of the stairs to the Embankment from Waterloo Bridge; the other is the public staircase which leads up to the dome of St. Paul's Cathedral.

HOT-WATER ENGINEERING.—XI.

Supply of Hot Water for Baths and Domestic Purposes.

the cylinder system (*concluded*).

IN attempting to lessen the cost of a complete cylinder apparatus, having a returned rising main, it was tried whether the cold supply could not be brought into the secondary return at a high point as Fig. 33, by this means saving from 40ft. to 70ft. of pipe, and the labour of fixing. Those who have read the previous papers will see how this attempt failed, for the water that issued from the taps was more cold than hot, as the arrows indicate. As the distance from the cold-water cistern to the tap is less, and the route more direct around the top of the circulating pipes than it is passing down through the cylinder and up again, there would be really more cold water drawn than hot; but if the tap was at the bottom of the house near the cylinder, the flow each way would be nearly equalised. In any case, however, this method, without some further addition, would be a failure.

If we introduce a stop-back valve in this cold supply pipe, the trouble will be overcome. This valve, which can be obtained at most tap-makers, only permits the water to flow through in one direction. Any attempt that the water may make to pass in the opposite direction is frustrated by the motion of the water itself closing the valve. This valve, if properly constructed, is reliable, and will not fail. It should be loosely fitted, so that it may answer to every movement of the water. This is understood by the makers. The position it should be fixed in is as Fig. 34, so that the water may flow unchecked from the rising main into its return; but when the tap is opened, and the cold water seeks a passage this way, it is stopped. It will be seen that when the tap is closed the water circulates normally; but when the tap is opened the rising main conveys the hot water up, while its return acts, for the time being, as a cold supply service. It must be particularly noted that when this method is adopted, the secondary return must not be connected into the upper part of the cylinder, but into the bottom, as if it were a cold supply-pipe. This is important, and should not be overlooked.

It should have been mentioned earlier that the cold supply service must be 1in. (with full way stop-cock as explained) for works of an ordinary character. A small apparatus will permit of a ¾in. pipe being used; and in extensive works the pipe may need to be 1¼in. or even larger, but for residence work the size first mentioned is almost invariably used. This applies more strongly to the cylinder than to the tank system, as in the latter case there is a store of hot water above the tap, and the outflow is not so greatly governed by the inflow of cold water as in the former system.

In concluding the cylinder system, it is necessary to give some approximate idea as to what sized reservoir should be used to meet a certain demand, and at the same time to suggest, as near as possible, the boiler that is suited for the apparatus, for the reservoir should be suited to the boiler, and *vice versâ*. A very common fault is fallen into in using too large a cylinder, there being some idea existing that the larger the reservoir, the greater the supply of hot water. This, however, is very incorrect, as will be shown. In suggesting the capacity a cylinder should be, it may be made to apply to a tank of the tank system, as in both cases the same-sized reservoir would be used to meet a certain demand; the difference in the system does not make a difference in the size of the reservoir.

Commencing at the smallest works, the reservoir for two, or perhaps three taps—viz., scullery sink, bath, and lavatory—should be 25gals.; some very small works might have one of 20gals. capacity, but never less. For this the boiler would only need to be of the saddle shape, with a fire 9in. wide; but let it be very clearly understood that this boiler and small fire would only be suitable in an instance where the bath and other taps were all within about 20ft. to 30ft. of the boiler itself—on the floor next over the kitchen probably. This is usually the case in small and moderate-sized houses.

For works on a little larger scale, say a medium-sized detached residence having a tap in scullery, one at bath, a housemaid's sink upstairs, and lavatory basin, a saddle boiler, if of good length and with a fire 10in. or 11in., would do;

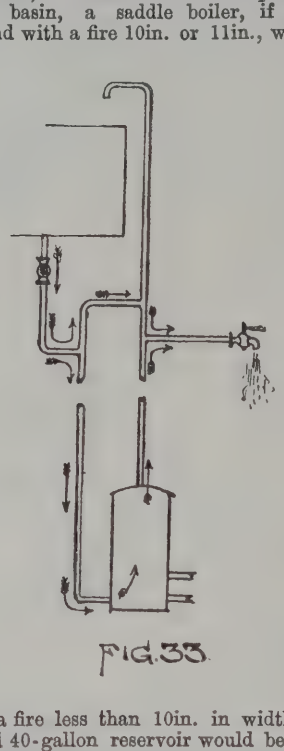

FIG. 33.

but with a fire less than 10in. in width a boot boiler and 40-gallon reservoir would be needed. In this instance, it is supposed that the system of pipes does not extend far from the kitchen; but it may be mentioned that the cylinder system permits of the pipes extending further than the tank system without prejudice to general efficiency. If the least doubt ever exists as to whether a saddle-shape will be capable, by all means use a boot boiler. Boot boilers act so much quicker, with so little attention and fuel, that they should always be used, whether the works need them or not, if the extra cost is not objected to.

When the requirements are a little greater,

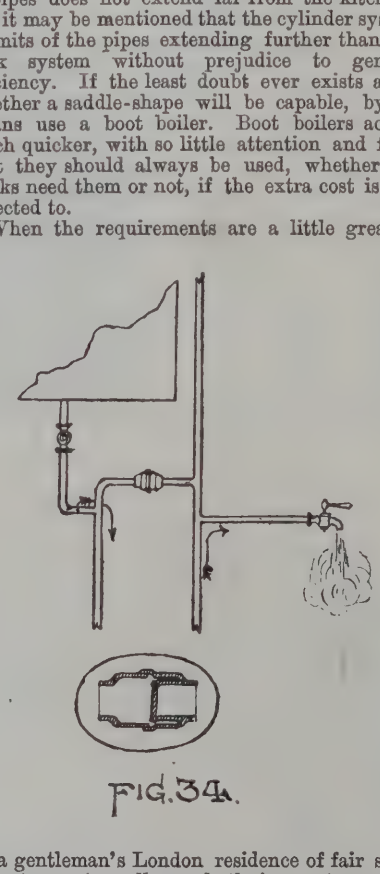

FIG. 34.

say a gentleman's London residence of fair size, with taps at scullery, butler's pantry, two lavatories, bath, and housemaid's sink distributed about the building, a boot boiler would be needed; but probably the range fire would need to be wider than 11in. This sized fire (with a boot boiler) should be considered the minimum, and larger would be needed if the number of servants kept, or the general requirements, made a considerable demand for hot water. The reservoir would require to be 50 gallons. The feature that goes far towards testing the capabilities of the boiler in this example is the butler's pantry sink. These sinks which are used for washing plate, &c., hold a large bulk of water; the water is required and is frequently changed, as it has to be They use quite as much water as two or housemaids' sinks.

In a larger residence with one or two taps (or perhaps only the same number as i last example, but with a greater demand fo water), a boot boiler, with 14in. fire and 60 gallon cylinder, would be needed. This n also be considered a minimum size of fi although in some large residences the numb taps is quite limited, the demand for hot is far from being so, on account of the large of domestics employed. Sometimes a dra service is taken from the domestic apparat the coachhouse or stable-yard, and in this the power of the boiler will be greatly t As before explained, it is much better in way to use an independent boiler if an possible. These articles have been dwelt fully in the earlier papers, and their advant cannot be over-estimated. The indepen boiler could be used by itself or worked in junction with a range boiler. The metho connecting up two boilers to one apparatus be spoken of and illustrated presently.

There is no doubt that in these two or t examples many will consider that the reser (cylinder or tank) are not of reasonable or portionate size—too small in fact. There prevailing idea that these articles should b full size, their greater capacity being neces for, and in some way adding to, the efficienc the works. No idea could be more errone and the writer wishes it to be clearly unders that the capacity of reservoirs given is the m mum, not the minimum, and smaller can be often with more pleasing results.

Those who argue for large reservoirs p out that they insure a fully sufficient bu hot water for all purposes, their capacity b such as to allow of this ample storage; and the argument ends. Opposed to this idea firstly, the fact that the larger the reservoir, longer its contents are in becoming heated, posing we wish to get it wholly full of hot w to benefit by its greater size. Now the partic objection to this is that, as a rule, there is a re supply of hot water wanted the first thing in morning for baths (adults and children), and the exception rather than the rule for boilers t capable of getting the reservoirs full of hot wa whether they be small or large, at this early h so the increased capacity would be of no vantage at this time. This is, in the majorit residences, the most important time in the when the quickest results are required, and objection, therefore, to the large reservoir at hour is that, as it has such a large bulk of water within it, it retards the storage of water, owing to the cooling influence it ef upon the heated water that comes up from boiler. With a smaller cylinder this ill e would be greatly reduced, and there would be best possible chance of the whole of the cont of the cylinder being heated. It will always found that as soon as the water near the bot of the cylinder (the coolest point) gets a l warm, the heating process proceeds r rapidly. While the water at the bottom of cylinder is cold, the boiler does not seem t doing such effective work, owing to the coo influence of this cold water upon that whic heated. This only bears important applica when the cylinder is being heated up the thing in the morning, when all water is to start with, yet when rapid results are p ticularly needed.

It is much the best to have a small reservoi this aids in getting hot water quickly w first lighting the fire. During the remainde the day its contents get heated very quickly efficiently in the intervals that occur between times hot water is needed. Of course, smaller the reservoir, the quicker and oft its contents are wholly hot, and it is much be in every way to have a 30-gallon reservoir of hot water, than one of double the capacity hot and half cold. A small reservoir does limit the quantity of hot water to be obta any more than a large one increases it, as is c monly imagined. If the range fire was put when once the reservoir was full of hot wa then it would be an advantage to have a l one to last a long time; but this is not the c for as a rule the fire is alight for about 15 h a day, and the boiler has heat applied to it this time. A cylinder as small as 25 gallons

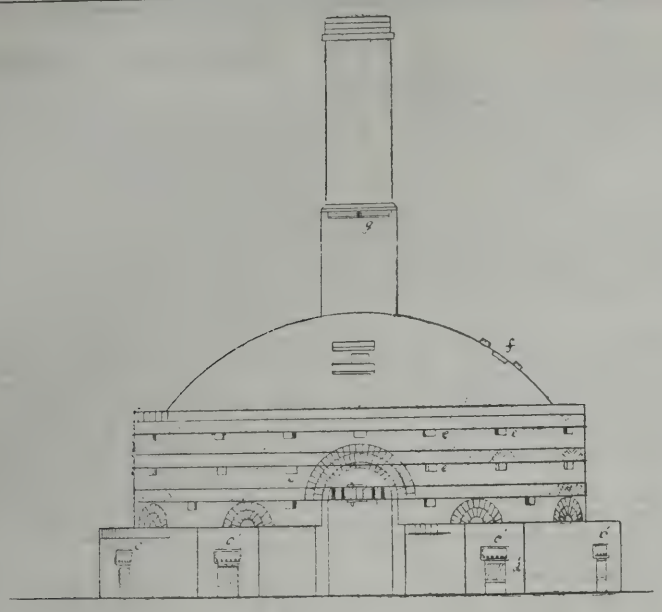

FIG. 1.

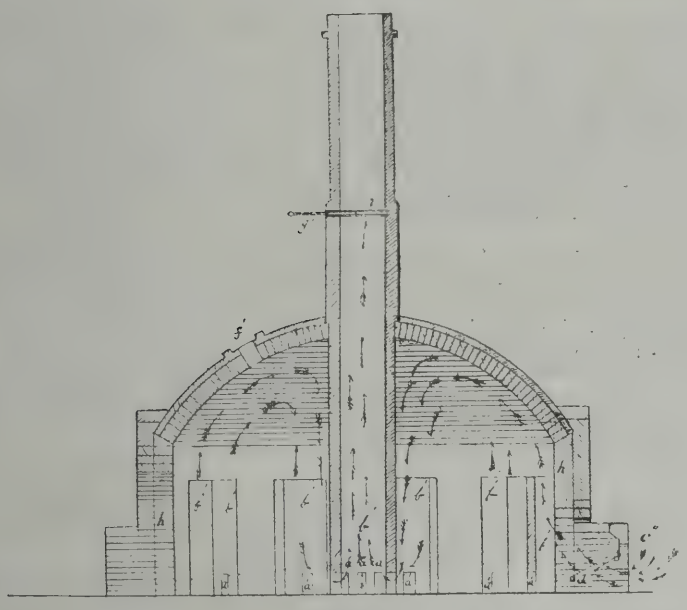

FIG. 2.

nish sufficient water for two baths at once, l this small size could have its contents heated again by the time the baths were disengaged. is almost needless to add that, besides other vantages, small cylinders and tanks are of the st expense.

A TERRACOTTA KILN.

THE following details of an over-draught terracotta kiln, as used in the North Wales tteries, will probably interest many readers. e most generally used and economical form of n for the firing of terracotta is that known as over-draught kiln, so called in contradis-ction to the muffled kiln. In the latter the me does not come into contact with the wares, hich are consequently produced with a more iform tone of colour than those fired in the er-draught kiln, in which the flame actually sses through the wares, as shown in the adjoin-g section, and indicated by arrows. Neverthe-s, the wares of the over-draught kiln are much eferred to those of the muffled kiln. The hole of the inside surface of the kiln, including e dome, is composed of a 9in. lining of fire-rick; the centre, or extract flue, and the side ues and furnaces, are built entirely in firebrick d fireclay; the outer portions in ordinary icks and mortar. The kiln represented is 16ft. ameter, has nine furnaces, *e e' e''*, with a corre-onding number of side, or inlet, flues, of 4½in. ickwork, attached thereto. The furnaces are ilt with a vertical, or straight joint, and are ot in any way attached or bonded into the brick-work of the kiln. They can, therefore, when burnt out, be easily renewed at very little expense and trouble. The subjoined letters are explanatory of the parts of kiln indicated by corresponding letters thereon:—*a a'*, air-holes in extract flue, for admission and exit of heated air and fire; *b b'*, inlet flues or shafts; *c' c' c''*, furnaces; *d d'*, furnace bars; *e*, projecting brick to carry bands round kiln; *f f'*, examination holes to test the wares; *g g'*, damper to regulate draught and heat; *h*, firebrick lining; *i*, damper frame.

The bands carried on corbel bricks *e* are obtained from neighbouring collieries, and are the

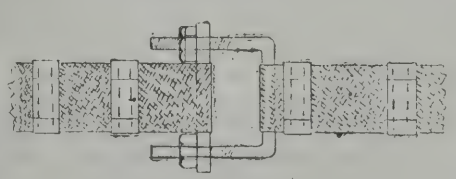

FIG. 3.

disused straps used for hoisting the "cage" from the coalpits. They are very flexible and strong, and well suited to stand against the expansion of the kiln during the process of firing. Each band is brought up to the required tightness by means of the bridle-joint (Fig. 3), which admits of tightening or slacking the band at pleasure by means of the nut or screw shown thereon. In a kiln of this kind there is always a steady concentration of heat and flame at the bottom of the kiln, especially at the exit-holes of the central shaft; for this reason, it is always advisable to stack the bottom of the kiln with bricks for a height upward of at least 2ft., the remaining space being stacked with terracotta—overfiring of the bricks being of less consequence than the chance of producing wares with a bluish, metallic-like appearance, the result of of overburning. The firing is started and left in a low condition for forty-eight hours, after which it is fired in full for an equal length of time, and then allowed to very gradually cool, sharp or cold draughts of air cracking the wares. In some cases the kiln is cooled by means of subterraneous flues, cooled by dampers leading from the kiln to the drying sheds, thus economising and using the heat in another stage of the manufacture.

F. WALKER.

PRICES.—XIV.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

CHIPS.

The additions to St. Mary's Catholic Schools, Widnes, are being warmed and ventilated by means of Shorland's patent Manchester grates, which have proved so satisfactory in the old schools, the same being supplied by Mr. E. H. Shorland, of Manchester.

Unity Church, Snowhill, Wolverhampton, is to be put into a thorough state of repair. Mr. Eachus, architect, of Bank-buildings, Lichfield-street, has examined and reported on the edifice. Estimates have been obtained for the renovations necessary, and the tender of Mr. Charles E. Burton, builder, of Heath Town, for the general builders' work has been accepted.

The committee of the combination poor-house at Dumbarton have under consideration plans by Messrs. McWhannel and Rogerson, architects, of Glasgow, for the enlargement of the house by 100 beds, at an estimated cost of £10,000.

The foundation-stone of new infants' National schools at Ashbourn, Derbyshire, was laid last week. Mr. G. M. Coulson, of Derby, is the architect.

At Northmolton, on Friday, a new Wesleyan chapel was opened. The building, which is Gothic in style, is erected by the side of the old chapel room, which was built in 1836. Local stone has been employed, relieved with freestone dressings. The chapel is seated with pitch-pine. The whole will cost a little over £600, but Lord Poltimore gave the whole of the local stone, and this has considerably reduced the cost. Mr. A. Lauder, of Barnstaple, was the architect, and Messrs. Saunders and Sons were the builders. The chapel will accommodate about 180 persons.

There has been added to the National Portrait Gallery a portrait of Sir John Glanvill, who was in 1638 appointed Recorder of Bristol, and elected to represent that city in Parliament. The portrait is a half-length, life-size. Across a very dark curtain is inscribed: "Serjeant Glanvill, Speaker of ye House of Commons, 1648."

Mr. W. H. Mitchell, architect, of Portland-street, Southampton, has been elected unopposed as a member for Nicholtown ward of the town council of that borough in succession to the late Jonas Nichols.

The members of the Monmouthshire Antiquarian Society held their annual meeting last week, when the ruins of Llanthony Abbey were visited, a paper being read in the abbey grounds by the Rev. Bagnall Oakley.

The east window of St. Mary's parish church, Frittenden, Kent, has been fitted with stained glass as a memorial. Messrs. Bucknall and Cooper, of Westminster, were the artists.

New-road Baptist Chapel, Bromsgrove, was re-opened last week after renovation and internal decoration from designs by Mr. C. M. Barber, of Hereford.

On Thursday week a new Wesleyan Centenary Chapel, at Heswall, Cheshire, was opened. The building provides accommodation for 325 adults, and consists of nave, transepts, and chancel, with minister's vestry and other conveniences at the rear. The style adopted is "Perpendicular" Gothic, and the buildings are faced externally with local red sandstone, rock-faced, in narrow courses. The total cost of the building, exclusive of seating, which has been transferred from the old chapel, is within £1,400, including heating and water supply. The contract has been carried out by Mr. John Shaw from the designs and under the superintendence of Mr. W. Thomas Cubbon, architect, of Birkenhead.

Upwey parish church, which has undergone renovation, was opened last week by the Bishop of Salisbury. A new floor of oak blocks laid upon concrete has been put down. The three galleries have been cleared away, and the church has been refurnished with oaken seats. The west window in the tower has been opened out, and also the tower arch, which had been completely hidden. Mr. Samuel Barnes, of Broadwey, is the builder, and the architect Mr. J. T. Micklethwaite, of Dean's-yard, Westminster. The cost of the work was £890.

Whilst four men, superintended by Mr. T. Varley, agent to Mrs. Roundill, of Gledstone, near Skipton, were engaged on Thursday afternoon in removing the props from a newly concreted roof in a stone-breaking shed on the estate at Gledstone, the roof suddenly gave way and came down with a crash. Mr. Varley had his thigh broken, and a labourer named Garness died from injuries sustained.

Building Intelligence.

Aston Ingham.—The parish church of As Ingham was reopened, after thorough restorati on Tuesday week, by the Bishop of Herefo The works have cost £1,500. Messrs. Nichol and Son, of Hereford, were the architects, Messrs. W. H. Smith and Co., of Weston-und Penyard, near Ross, the contractors. T church has been partially rebuilt. Both walls the nave and the chancel had to be pulled do and reconstructed, a new roof put on, the seati and flooring were defective, and demand renewal, and the tower has been repointed. T chancel arch has been raised by 3ft. 6in., and flooring, ceilings, and seating have been renew in oak throughout the whole edifice. The fl of the chancel has been laid with encaustic til from the works of Messrs. Godwin and S Lugwardine, and a new oaken pulpit, with th carved panels, has been erected upon a stone ba During the excavations in the chancel two st coffin-lids were taken up, and let into the wall either side of the altar.

Edinburgh.—Extensive alterations have b decided on at St. Mary's Roman Catholic Cath dral, Broughton-street, Edinburgh. Considera progress has been made with the work, and Saturday a foundation stone was laid by Arc bishop Smith. The side chapel recently destroy by fire, together with the vestry behind it, to be formed into a south aisle and new vest and a corresponding aisle will be constructed the side of the nave. The present side walls the main building are being removed, and th places taken by moulded columns with poin arches intervening for the support of the ro One effect of these alterations will be to dou the accommodation of the cathedral, and make capable of seating about 2,000 persons. It also contemplated at some future time to thr the present chapel-house into the main buildi so as to greatly extend the church rearwa from the present altar, and also to erect t massive square towers at the western Broughton-street end. The work in all w cost £9,000. The plans have been prepared Mr. John Biggar, architect, 8, Dryden-stre and the work now in progress will be finished November next.

Work has just been commenced on a R Volunteer Drill-hall in Bedford-circus, Exet Messrs. Tree and Bolley, of that city, are contractors.

In the course of the work now going on Peterborough Cathedral, the stone marking spot where Queen Catherine of Aragon is said have been buried has been removed, and under has been found a well-made brick vault w plastered sides. The vault was filled with ea and stones, and at the bottom was a leaden coff The coffin was left *in situ*, and no attempt w made to open it.

Considerable additions have just been made the modern stone reredos and its surroundings the chancel of St. Mary's Church, Penzance. T reredos has been extended the whole width of t sanctuary, and in the niches have been placed statues. The tiles which lined the sanctuary wa have been replaced with ashlar of polish alabaster, surmounted by a carved cornice. M Harry Hems, of Exeter, executed the work.

Mrs. Knowles, of Greenfield House, Hoyla Barnsley, wishing to present the town with a su able and permanent gift, got permission of t local authorities to add a tower to the public h and fix a large illuminated clock, with four 8 external dials, and a bell of 4cwt. The clock w set going on Saturday last, on what is hoped successful career. The necessary alterations to t structure have been carried out by Mr. Walter Sykes, architect, Hoyland, and the clock, which from the designs and plans of Lord Grimthor was made and fixed by Messrs. W. Potts and So of Guildford-street and Cookridge-street, Leeds.

St. Paul's Church, West Smethwick, which h recently undergone extensive alterations and r pairs, was reopened on Friday. The alteratio include the removal of the north gallery and t raising and reflooring of the chancel. A new windo has been opened out on the south side, and cho stalls have been erected. The west gallery has be reseated, a new heating apparatus has been pr vided, and the lighting arrangements have be improved. The repairs and extensions have be carried out by Messrs. J. Harley and Sons, Smet wick, from designs by Mr. T. H. Fleming, t diocesan architect. The cost has been about £1,3

QUESTIONS.

0604.]—**Weights and Measures.**—My son ts to pass an examination in the Weights and sures Act of 1889, for the purpose of getting a situa-as inspector. Will anyone kindly let me know what examination is, and where the examination is held?—. TAILER.

0605.]—**Central-Hung Sashes.**—Is there any of making a central hung sash to remain at any le it may be opened at, with the line now used?—T. NING.

0606.]—**Lych-Gate.**—Would some authority inform bscriber what is the correct width of a lych-gate, and size and height of the centre frame to support the n? Should the gates be made to open both ways?—QUIRER.

REPLIES.

0599.]—**Hot-water Engineering.**—Replying to . C. B.," there is no objection to taking the cold ply into the primary return, except that, as a rule, it ld require a little more pipe. No gain would be cted. There would really be a slight disadvantage erienced, though too intricate to be explained here, not worth taking into consideration.—THE WRITER THE ARTICLES.

t the Godalming County Court on Thursday, ore his Honour Judge Lushington, Joseph rson Fitzgerald, lately carrying on business as a lder, and formerly for thirty years a timber rchant in London and Woking, applied for his charge. Mr. A. Mackintosh (the Official Re-ver) stated that the deficiency amounted to 391. Bankrupt's discharge was suspended for months.

LEGAL INTELLIGENCE.

ARBITRATION CASE. — NEWELL v. LIVERPOOL CORPORATION.—Sir John Coode forwarded on Tuesday to the City Council of Liverpool his award in the Mersey Aqueduct case. Messrs. Monk and Newell's tender for constructing the aqueduct tunnel under the Mersey at Fidler's Ferry, to convey the new water supply from Lake Vyrnwy to Liverpool, was accepted, and the work proceeded. Disagreements arose between the contractors and the Liverpool Corporation engineer, Mr. G. F. Deacon, which caused the stoppage of the work, and for the work executed by Messrs. Monk and Newell they made a demand, upon which Sir J. Coode was appointed arbitrator. After hearing evidence for sixteen days he has awarded Messrs. Monk and Newell £14,423 10s. in addition to judgment in their favour on the counter-claim of the Liverpool Corporation for penalties alleged to be due under the contract, and for the cost of completing the tunnel. Each party is adjudged to pay his own costs of reference, and half the arbitrator's charges and costs, which latter amount to £953. The defendant's counter-claim was for penalties alleged to be due under the contract, and for the cost of the completion of the tunnel by Messrs. Cochrane and Sons, which cost the Corporation will now have to pay.

CONDITIONS GOVERNING SALES AFTER AUCTIONS.—In the Lord Mayor's Court, on the 7th inst., the case of "Price *v.* Bagg" was tried before the Assistant Judge (Mr. Roxburgh) and a jury. The plaintiffs, Messrs. Price and Hughes, timber merchants, of 27, Clement's-lane, E.C., sued the defendants, Messrs. Bagg and Frampton, dealers in builders' materials at Bournemouth and Weymouth, to recover £39 14s. 1d., being the loss on re-sale in a parcel of timber, which the plaintiffs alleged the defendants had bought at an auction, and which they refused to take. The defendants pleaded never indebted. Mr. Churchill, of the firm of Churchill and Sirum, timber brokers, of 27, Clement's-lane, said that on 28th January he held a sale of timber at the Baltic Sale Rooms. Mr. Frampton, a member of the defendant's firm, attended and bid for several lots, buying several. At the end of the sale Mr. Frampton came up to the desk where witness was sitting and inquired about lot 241, which was "992 12ft. bright yellow deals, second quality," and bought it at the reserve price. At the same time that Mr. Frampton bought lot 241 he also bought lot 426, and he also made offers for other lots. But he stipulated that he should give bills at six months in payment. The plaintiffs refused this offer, and so the sale was not completed. The defendants, however, took delivery of and paid for lot 426. Lot 241 was subsequently put up for auction, and realised a sum less by the claim in the present action. Mr. Churchill, cross-examined, said that lots 241 and 426 were bought as one bargain, and not different bargains. Mr. A. T. Frampton, one of the defendants, said that at the sale he purchased several lots in open bidding, and these he had paid for; but after the sale he went to Mr. Churchill at his desk and asked the reserve prices of lots 241 and 426. He was told, and he bought lot 426, and he had paid for it. Lot 241 exceeded £100, and he told Mr. Churchill that he was willing to purchase that lot on condition that he could draw on the vendors at six months. This he found he was unable to do, and so he would not buy. The purchase was an entirely distinct bargain to the purchase of lot 426. Mr. Gosling, manager of the defendants, corroborated. The jury found for the defendants. The learned judge said that it was a curious coincidence that the case on which he had decided the point of law in the case—namely, that an auctioneer could not bind a buyer after the sale, was tried in 1885; it was a timber sale, and the defendant's name was Churchill.

NO DEFINITE CONTRACT.—HILL v. STEPHENS.—This action, tried before Mr. Justice Hawkins at the Sussex Assizes on the 10th inst., was brought by Mr. Charles Hill, a builder, of 29, Gerard-street, Brighton, against Mr. George Stephens, of 103, Ditchling Rise, to recover £274 9s. 2d., for work and materials supplied, and the defendant put in a counter claim for £200. The amount claimed was the balance of an account for work done and materials supplied in building two houses. The defence was that it was agreed that the houses should be built for £300, and in the alternative that the plaintiff's charges were excessive. The defendant also alleged that the houses were not built in a workmanlike manner, and were unfit for habitation, and that for this reason they were unlet for some time, and for this the defendant claimed £200. Evidence was given by the plaintiff, and on his behalf by men engaged on the works, Mr. William Parnacott, surveyor, Mr. S. Holloway, builder, and Mr. Mabson, assistant borough surveyor. The jury found that there was no contract, and the foreman said they felt there had been a misunderstanding. Judgment was given for the plaintiff upon this point, and the question of value then arose, and it was decided to refer this to an arbitrator, together with the claim by the defendant for damages on account of alleged unnecessary delay.

COMPENSATION CASE.—At the Surveyors' Institution, on Friday, the property compensation case of "Bates v. Shortlands and Nunhead Railway" was heard before Mr. R. C. Driver, surveyor. Mr. Joseph Bates, as a keeper of dining-rooms, of North-quadrant, Brighton, claimed £1,810 compensation for his freehold interest in a piece of freehold land, well timbered, at Catford, on part of which only, a house can be built, "so that there would be about three acres of ornamental accommodation ground attached, rendering the property in such a position especially attractive." The freehold interest was subject to a lease of the land to Mr. C. Storey, builder, of Lewisham, for 99 years, from Michaelmas, 1888, at £55 per annum rent, with right of acquir-the freehold for £1,100. The claim was made up as follows: for the freehold, £1,100; ten per cent. compulsory purchase, £110; surveyor's charges, &c., £600; total, £1,810. The proceedings were confined to the three acres taken by the company, leaving the remainder of the property and the question of damages to form the subject of further proceedings. Mr. Howard, valuer, for the claimant, said that as compensation he would give £600, including 10 per cent for compulsory sale, they had the total of £660. Mr. R. Reid and Mr. Arthur Skitt, auctioneer and surveyor, both agreed with this valuation. For the company, Mr. Samuel Walker, F.S.I., considered £5 per acre a fair price for land in the neighbourhood of the property. He would give for the three acres £15 per year, with 20 years' purchase, making £200. Mr. Arthur Garrard, F.S.I., agreed with this valuation. The land in the neighbourhood, through overbuilding, had considerably deteriorated in value. The Arbitrator reserved his award.

EMPLOYERS' LIABILITY CASE.—An action was brought in the Liverpool County Court on Monday, under the Employers' Liability Act, by James Somerville, a bricksetter's labourer, of Liverpool, against Messrs. James Thornton and Sons, builders and contractors, in Liverpool, to recover compensation for injuries sustained through negligence. The claim arose out of operations at the old Theatre Royal, Williamson-square, which was being converted into a cold storage establishment. The plaintiff's case was that he was engaged in January last in helping in the raising of an iron column on the second floor of the building. A foreman directed the plaintiff and another man to use a lever to move the column. They did so, and the extra strain coming upon the chain, it broke. The column fell and broke the plaintiff's leg and inflicted other injuries. He claimed £192.—The jury gave a verdict for the plaintiff for £100.

IN RE R. COSSLETT, JUN.—At the Bristol Bankruptcy Court, on Friday, the examination took place of Richard Cosslett, the younger, of Westminster Villas, Lower Weston, Bath, builder, lime burner, and contractor. The statement showed liabilities to unsecured creditors £1,269 14s. 11d., creditors fully secured £8,969, creditors partly secured £4,160, of which £3,668 was estimated to rank for dividend. The available assets were £80 16s. 11d., leaving a deficiency of £4,848 18s. The alleged causes of failure were "stoppage of a portion of his works by injunction 18 months ago, which in effect stopped the whole; great expense through litigation, and great depreciation of property in Clifton." The Official Receiver reported that the debtor, who has not been in business for some 18 months past, commenced on his own account as a builder and contractor 21 years ago with a capital of £2,000, being his share of a partnership business previously carried on with his father. He had also carried on the business of a lime burner and brick and tile manufacturer. He appears to have been engaged in expensive litigation, as he alleges, in protecting his property and business. The available assets compared with the amount of liabilities are practically nil. The debtor has, however, a life interest on the death of his wife in her property, originally estimated to be about £2,950. The value of which, if anything, must be very small. The books are not well kept.—No offer was made.

CONTRACTOR'S LIABILITY FOR QUANTITY SURVEYOR'S FEES.—The plaintiff, Mr. D. H. North, a surveyor, practising in the City, sued the defendant, Mr. W. Bassett, a builder, in the City Commissioners' Court, on Friday, to recover £26 5s. for services rendered as a quantity surveyor in respect of a contract which the defendant entered into to build Holywell House, Streatham. The plaintiff was instructed by Mr. Grosvenor, the architect of Holywell House, and the son of the building owner, to take out the quantities for the building. The defendant was the builder who successfully tendered for building the house, and it was contended that that being so, he was liable to pay the plaintiff's charges of 25 guineas for taking out the quantities, as the amount claimed had been included in the tender. By the custom of the trade, the architect had implied authority from the builder to instruct a surveyor to take out quantities, as a builder could not tender without having the quantities taken out. The defence was that the amount had been paid to the architect, Mr. Grosvenor. In the result, the

Judge non-suited the plaintiff on the ground that there was no privity of contract, and leave to appeal was given.

WATER SUPPLY AND SANITARY MATTERS.

Edinburgh and District Water Supply.—The consulting engineers, Messrs. Gale, Hill, and Mansergh, have recommended the Manor district as that to which the Water Trustees for Edinburgh and Leith should look as a new source of water supply. The report has not yet been printed, but the engineers have very considerably increased the estimate of £664,000 for 15,000,000 gallons per day from the Manor, which was given by Messrs. Leslie and Reid in 1890. It is suggested that the scheme should be proceeded with in two instalments. Under the first half the supply would be increased by 10,000,000 gallons, and under the second half by an additional 5,000,000 gallons. The opinion of the Town Councils of Edinburgh, Leith, and Portobello will be taken as to the propriety of proceeding in the next session of Parliament with the scheme.

Kilham, Driffield.—At the meeting of the Driffield Rural Sanitary Authority on Friday, the efficiency of the sewerage system of the village of Kilham, just completed at a cost of some £1,500, by Mr. Mather, of Hull, from plans by Messrs. Oldham and Bohn, of that place, was again under discussion, Mr. Bohn having sent in his final certificate. A letter was read containing various resolutions passed at a parish meeting in the vestry at Kilham on the previous day, condemning the scheme. For months past, the parish—or some portion of it—has been against the manner in which the scheme has been carried out; and a Government Inspector has been down and held an inquiry, and reported that there was no fault to be found with the work. Mr. Bohn wrote explaining many matters; but in deference to the wishes of the parish, the payment of the final certificate was held over.

At a sitting of the London Consistory Court held on Tuesday, Dr. Tristram, the Chancellor, decreed faculties for enlarging All Saints' Church, Knightsbridge, by 200 sittings, at an estimated cost of £4,000, and for alterations to St. Jude's Church, Gray's Inn-road, at a cost of £500.

In the case of Martin George Deavin, of Ivydale-road, Nunhead, late of New-road, Rotherhithe, Rushey-green, Catford, and Dundas-road, Peckham, auctioneer's clerk, formerly auctioneer and builder, now out of business, the registrar of the London Bankruptcy Court has suspended the discharge for two years.

At the Liberal Club, Newcastle-on-Tyne, on Tuesday, the Countess of Carlisle unveiled a portrait of Mr. Gladstone, which had been painted and presented to the club by Mr. J. W. Brown.

George May, a navvy engaged on the Tottenham and Forest-gate Railway, now in course of construction by Messss. Lucas and Aird, was charged, at the Stratford Petty Sessions on Tuesday, with assaulting and intimidating two fellow workmen, because they would not join in a strike. The prisoner was remanded.

New Board schools for 400 children are about to be built at Foleshill, Warwickshire, from plans by Mr. T. F. Tickner, M.S.A., of Bishop-street, Coventry. The buildings will be of plain red brick, with moulded dressings and Broseley tiles for roofing.

Out of 48 candidates who sent in their applications for the post of surveyor, the Court of the Company of Skinners have appointed Mr. W. Camphen Jones, A.R.I.B.A., 32, Bedford-row, W.C.

The Council of the British Association held its annual meeting on Wednesday, when a committee recommended that steps should be taken to bring the Ordnance maps of the British Islands up to date, and to make them more accessible to the public. Sir D. Galton announced, before the close of the meeting, that some new arrangement would be made in regard to the sale of these maps.

The death of Mr. Henry Pooley, the town chamberlain and borough surveyor of Wisbech, took place last week. He was 73 years of age, and was appointed to the offices in Feb., 1876. He was at one time associated with Mr. Chapple, of Holbeach, builder, and was his clerk of works during the erection of Ely-place Baptist Chapel at Wisbech. The sewerage of the town, and many other important public improvements, have been carried out during his term of office.

A memorial church is about to be erected at Highfield, near Wigan, from plans by Messrs. Paley, Austin, and Paley, of Lancaster.

The cope chest at Salisbury Cathedral, which is said to be coeval with the building, has recently been placed in the north aisle of the choir, where it is seen to great advantage.

Our Office Table.

The *Times* of Saturday published an extraordinary letter from a Mr. George H. Jaques, of Herne-hill, urging that in place of completing the Museum buildings at South Kensington from Mr. Aston Webb's designs, the old scheme prepared by the late Major-General Scott, C.B., a large portion of which has been carried out, should be adopted. This scheme, which is illustrated by the well-known model in the museum, is, Mr. Jaques says, with an unconscious touch of sarcastic humour, "in more striking contrast" to Mr. Waterhouse's work at the Natural History Museum than is that of Mr. Aston Webb. Precisely so.

A rather curious action against the Leominster town council was brought by a confectioner to recover damages for detention of plans which had been submitted to the authority under the usual by-laws requiring a deposit of the plans of a contemplated building. His Honour, the judge of the county court, decided that the plans are not the property of the authority, and they had no right to detain them, and after hearing evidence his honour said he thought the plans ought to be returned to the builder for the purpose of carrying out the building and making copies and all that is necessary, and that they should be submitted to the surveyor at all reasonable times for his inspection of the building, and that on completion they should be again returned and deposited with the authority. The judge further said the authority should retain the plans 14 days, and refused application for appeal. This ruling will be thankfully received by architects and builders who are too busy or lazy to make copies; but urban sanitary authorities will be naturally staggered at a decision which makes the by-law on that behalf of no effect, and repudiates the power conferred on authorities to detain plans deposited.

At the opening of the Socialist Congress at Brussels, on Monday, it was announced that Mr. Burton, from London, was in attendance, not as a delegate, but in order to appeal to the Congress for sympathy on behalf of the London carpenters and joiners whom he represented, and who were now on strike. It was unanimously resolved that Mr. Burton should be permitted to remain, and that as the London carpenters and joiners had struck for shorter hours, he should be allowed to speak when the eight-hours question came on for discussion. This opportunity to address the Congress came on Tuesday morning, when Mr. Burton lucidly explained the circumstances connected with the present dispute, adding that it would materially assist the United Trades Committee if Continental workmen refrained from crossing the Channel to fill the places of those on strike. These remarks, on being translated, were cordially received, and a sub-committee was directed to consider the subject, and send, if possible, some small pecuniary aid to the committee as a token of goodwill.

Wood pulp is now extensively used as a composition for mouldings and decorative purposes in private and public buildings. In the manipulation of this composition, good effects can be obtained by mixing in it the various aniline colours—strong or tinted—or those known as metallic colours. Bronze powders of various colours may also be used with pleasing results. By the use of this material all the better qualities of fine-grained wood are obtained without any of the drawbacks of shrinking or expanding on account of atmospheric conditions, says the Pittsburgh *Dispatch*. The inroads on the forests of the United States, which the growing consumption for railway ties, building, and the requirements of the press involve, are enormous. So serious has this matter become, that, unless each State passes a law for the encouragement of tree-planting, so that the woods can be replenished, there will soon be a tree famine. As giving an inkling of the magnitude of the general consumption of wood pulp, a correspondent states that for a single edition of an American daily paper, 17 tons of blank paper was recently required. This was the product of 67 cords of poplar. In 22 hours from the time of felling the trees it had been turned into printed sheets.

Mr. T. W. Millard, of Rugby, has been elected surveyor to the Rugby rural sanitary authority.

CHIPS.

At Nordenhamm, in the Grand Duchy of Old[enburg], on Wednesday, a temporary scaffold[ing] erected in connection with the building of a [new] pier and landing stage for the Norddeutscher Ll[oyd] Steamship Company, collapsed without warn[ing]. About fifty workmen were on the structure, [the] loading material to be used in the construction [of] the pier, and many fell into the water. Ten [were] drowned, and nine sustained severe injuries by [the] fall. One of the injured has since succumbed.

Mr. Adams Acton's bronze statue of John Wes[ley] has been placed on the pedestal of granite erected [at] the entrance to City-road Chapel. The for[mal] reopening of the restored chapel will take pla[ce] fortnight hence.

At the National Welsh Eisteddfod at Swans[ea] on Wednesday, Mr. H. Wall, of Newport, [was] awarded a gold medal and first prize for p[ier] wood-carving in oak, and a cheque for ten gui[neas] and a silver medal for the best carved oak Ba[rd's] chair were secured by Mr. W. T. Morgan [of] Swansea.

Mr. R. C. Reid, C.E., Edinburgh, has repo[rted] that the South Harbour-street wall, Ayr, has fa[llen] through its own inherent weakness, and from [the] fact that the foundation has been rendered inse[cure] by the scouring action of the river, and, furt[her] that this scouring action is in a great measure [due] to the artificial deepening of Ayr Harbour. [Mr.] Reid recommends a new wall, to be founded on [the] shale or blaise under the clay, about 5ft. below [the] water. The cost would be £1,200.

The Corporation of London have recen[tly] entirely remodelled and renewed the drain[age] system at the Freeman's Orphan School at Brix[ton], where 200 children are boarded and educa[ted]. After a death from diphtheria, the sanitary auth[or]ities of Lambeth and the City surveyor (Mr. [W.] Murray) examined the drainage, the result be[ing] the decision that the system which had existed [for] 40 years was not only entirely out of date, bu[t] incomplete and inefficient as to constitute a ser[ious] source of danger to those living in the school. 'Th[e] whole of the drains have been removed and [new] drains carried outside the building; these ha[ve] been laid in concrete, and tested length by leng[th], besides being ventilated and cut off from direct co[m]munication with the public sewers.

The foundation stone has been laid of the [new] sick hospital for Dundee, about to be built [from] designs by Mr. Alexander, of that city.

The church at Marr, near Doncaster, was re[-] opened on Friday after restoration. The work [has] been carried out under the direction of Mr. J. [C.] Hodgson Fowler, F.S.A., of Durham, and the [cost] has been about £800. A new open-timbered [roof] has been placed over the nave, and a waggon-h[ead] timbered roof over the chancel. The west [end] gallery has been removed, and the space under[neath] tower opened out and a screen erected, formin[g] bell chamber and vestry. The nave has been re-seated throughout, and the flagging renewed. [The] choir stalls have also been fixed.

Mr. Holman Hunt has decided to accept the [sum] of £3,580 for his picture, "The Triumph of [the] Innocents." Of this amount £1,500 is paid by [the] Corporation, and £2,080 is subscribed by admir[ers] of the artist in Liverpool. The picture will now be placed in the permanent collection at the Wa[ker] Art Gallery.

The memorial stones of a new Primitive Metho[dist] chapel and school at Burton-road, Withington, [were] laid on Saturday. The buildings, which have [been] designed by Mr. Joseph Swarbrick, of Manche[ster], are to be of red brick, faced with Ruabon brick [and] terracotta. They will be in the Early English s[tyle]. The chapel will have accommodation for 300 pe[ople], and the school will provide room for 100 childr[en]. The cost will be about £1,700.

Local Government Board inquiries were held at Plymouth, under the supervision of Mr. J. T. Jr[i]rison, M.Inst.C.E., on Tuesday and Wednesda[y] at the Guildhall. On Tuesday the inquiry had re[fe]rence to the application of the town council of Ply[mouth] for sanction to borrow £56,000 for works of sewerage, £3,000 for work of street improvement, and £583 for the erection of a shelter on the Recreation ground. On Wednesday the applicat[ion] of the councils of Plymouth and Devonport and Stonehouse Local Board for the borrowing of £7,00[0] to form Deadlake into a recreation ground were considered.

Holloway's Ointment.—Go where you [may], persons will be found who have a ready word of praise for this [oint]ment. For chaps, chafes, scalds, bruises, and sprains, it [is an] invaluable remedy; for bad legs, bad breasts, and piles, it [may be] confidently relied upon for effecting a sound and permanent cu[re].

BILLS OF QUANTITIES & PLANS.

E BUILDING NEWS
ND ENGINEERING JOURNAL.
VOL. LXI.—No. 1912.
FRIDAY, AUGUST 28, 1891.

LOCAL AUTHORITIES AND ARCHITECTS.

D-TAPEISM, or official ceremoniousness, useful as it is in the conduct of e business, yet sometimes defeats its nds. In building operations as carried our larger boroughs, formalities and ctions have rather engendered ill-feeling nodes of evading the law, than assisted s observance. A good deal of this on and lack of cordiality between rities and builders may be traced to ersonal equation. Arbitrary and overng officials may make the machinery of nistration so hard to work that a great lubricants, in the shape of bribes or , have to be resorted to, as we have in the case of more than one public

Again, other men appear to resent kick" against order and routine of kind, and to imagine that public s and formalities are created to bestow rs rather than to facilitate business. egularity and ceremony are to them tionable and irksome. Between these lasses of persons hindrances cannot fail se. The personal equation may include ier kind of drawback to easy adminisn of the law—we mean the installation ower of officials who prefer to stand on tter of their authority than to adopt the of the statute. Take, for example, two ree of the by-laws in force in the polis and in many provincial towns. A w under the Amendment Act of 1878 des that the site of a building shall be d of all fæcal, animal, or vegetable r or refuse, and the excavation filled up hard brick or dry rubbish. A district yor may enforce all that is laid down in liance with this rule, and yet allow a ing to be erected over a disused cesspool ain. Till the by-law lately passed was in tion, builders could fill up any excavanear with rubbish, or allow it to remain

Again, while every care is seemingly to prevent the rising of impure subir into the building, the Metropolitan ws allow a house to be built on a swamp egnated with moisture. Thus, while elling a building owner to comply with tter—as, for example, excavating dry e which has become inert for harm—he nevertheless omit to do that which is important to the health of the inmates. imperfection of the by-laws in not ding for the drainage of the site is less to be remedied. The rule which res a layer of concrete over a site which of gravel or a virgin soil is practically tle avail, because it often happens that of gravel or natural virgin soil is even dangerous than one that has been up with dry rubbish. With the politan area, ventilation beneath the t floor is not compulsory; no by- is in operation requiring a dampmaterial or a lining of asphalte to outside of a wall from the dampe to the basement floor, yet these necessities which are more likely e ignored when the mere letter thority is enforced. Many other better s than those specifically laid down t be adopted with the concurrence of istrict surveyor in particular cases, but es not trouble himself with suggesting or better plans. Under the Public h Act, the by-laws in force are often nistered by officials who are very unng, and who demand a literal compliance, according to their own ideas of the law; they have strong prejudices against modes of construction, which, though permissible, are not usual, as, for instance, half-timbering, the employment of concrete and terracotta, dry areas, and other means of excluding damp. But the discretionary powers vested in the authorities are seldom used by officials of the stamp we are discussing; on which account it is more necessary that the by-laws should be sufficiently comprehensive to meet various circumstances, than that discretionary powers should be capriciously exercised. The model by-laws, as revised and in operation at Manchester and other large towns, are, happily, more perfect and comprehensive than those of the Metropolis. They have made it more difficult to evade necessary precautions, at the same time they are less irksome and exacting than rules which were framed upon imperfect data, and administered by arbitrary officials. While in the Metropolis a builder can erect a house upon a damp, low site, that has been covered with a layer of concrete, and build solid, permeable walls to his basement, in the provincial town the subsoil has to be drained, the site elevated if necessary, also in every case covered with a layer of concrete or asphalte; the space under the lowest floor has to be ventilated, and the external basement-walls built with a cavity; the model by-laws also fix a minimum of area for light and air, regulated by the size and height of house. These are rules which are enforced with undoubted advantage to builders, and which no architect will question. Thus, in the new Manchester By-laws, it is provided that in the erection of every new dwelling-house a distance of 36ft. at the least shall be provided free from any erection except a porch or portico, between its front and the opposite side of street; and that in the rear of any house a space must be left of not less than 150ft. square, free from any erection, such space to extend the whole width of the house, and to be not less in depth than 10ft. in any case, but to be controlled by the height of house, the lower houses having a distance to the adjoining boundary equal to their height. No room other than those in the roof is to of less height than 9ft., and the scantlings of joists, rafters, and purlins are prescribed. A great deal of extra labour is imposed upon the local surveyor, whose power of using his discretion in some cases becomes absolutely necessary to the satisfactory administration of the law.

Amongst the powers vested in local urban authorities is that of the right to retain plans of buildings about to be erected. Many of the provincial by-laws in force have a clause which enacts that "Every person who shall intend to erect a building shall give notice in writing to the Corporation of such intention, to be delivered or sent to the Borough Surveyor at his office, and shall deliver or send at the same time complete plans and sections of every floor of such building, which shall be drawn to a scale of not less than 1in. to every 8ft., and shall show the position, form, and dimension of the several parts of such building, and of every water-closet, earth-closet, privy, ashpit, and all other appurtenances." He is also at the same time required to deliver a description of the materials to be used, and of the mode of drainage and means of water supply; a block-plan to a scale of 1in. to 44ft., showing width and levels of the streets or land adjoining, showing the lines of drainage and the size, depth, and inclination of the drains. These drawings are deposited with the surveyor of the authority for the purpose not only of informing the latter of the kind of building contemplated, and of obtaining their sanction, but also to enable the surveyor to see that the building is being carried out according to the plans. For this object it is necessary that the plans should be retained by the authority—at least, so long as the building is in progress; but a decision given by the Leominster County Court Judge has declared that an urban sanitary authority has "no right to detain them as their property." The question before the court was: whether an authority had the right to detain plans submitted to them as their property, or merely to approve them and see if they were carried out? On their side it was argued that the authority could not exercise their powers of seeing the building carried out in compliance with the plans approved if they had to be given up; that the usual practice was for two copies of the plans to be made, one to be deposited with the authority, and the other to be kept by the builder, and that in the case of "Gooding v. the Ealing Local Board," tried before Mr. Justice Mathews in 1884, it was ruled that the authority had the right to detain the plans even though the plans were not approved, and there were no by-laws. On the other side, it was contended for the plaintiff that the architect having only made one set of plans, and these being retained, it was impossible to proceed with the work; further, that the by-laws did not give the authority power to retain the plans; and in reference to the case cited it was pointed out that although there was no by-law, there was an undertaking entered into by the builder to deposit all plans with the authority, whereas there was no such contract with the Leominster Corporation. Again, it was asserted that the by-laws were made under a statute that had been repealed. The Judge decided that the plans should be returned to the builder within three days, for the purpose of carrying out the building and making copies; that they should be submitted to the surveyor of the authority at all reasonable times for his inspection of the building; and that when it was completed they should be returned and deposited with the authority.

Only one copy of plans was made in this case—a very unusual circumstance; but the decision, if it is accepted as a precedent, is to the effect that the plans are to be left for the purpose of obtaining the approval of the authority, and not of becoming their property. But the Leominster by-laws are not very explicit: "Leave, or cause to be left," can hardly mean that the plans are to be deposited as the property of the authority, and, until the clause is so recast as to clearly express that the plans deposited are intended to become their property, it can hardly be surprising to hear of such misapprehensions. Authorities and architects and builders will take a timely warning by this decision: the first, to make their by-law clear, and the second, that two copies of plans ought always to be made—one for deposit, and the other for use. It seems surprising that any builder should have mistaken the intention of a by-law so generally understood, and have deposited the only set of plans with the authority. They had given consent to the builder to make copies at the office, but he had not availed himself of it. The decision, too, appears contradictory: the plans are, according to the judge, not the property of the authority, though the order he makes is that they are to be returned to them after the building is finished. Of what good are the plans to an authority after they have been carried into execution? Many local authorities will be surprised at the ruling; on the other hand, there are some in the profession to whom it will be welcome. The deposit of plans of buildings with local authorities has never been very favourably entertained. Some record is necessary, however, for the use of the surveyor, and we cannot see how the by-laws can be carried out unless the block plan, levels, and drains are furnished for reference, as well as for retention by the authorities. Those who framed the statute could

never have intended any other arrangement than that plans once deposited should be retained, and perhaps it is fortunate that the attention of local authorities should be called to the defective wording of the clauses.

URBAN AND SEASIDE RESIDENCES.

AT this period of the year, when a general exodus of Londoners takes place, and when houses in the Metropolis are vacated for some weeks, or given over to the painters and decorators and plumbers, it is natural and befitting that some attention should be bestowed on the condition of dwellings. Only a very small proportion of the residences, even at the West-End, have been erected on those principles which are now acknowledged to be desirable. How many of the larger residences remain absolutely in the same state as they were before the revival of sanitary science, without any of the conditions required by the more recent Acts—basements which receive exhalations from the soil, ill-drained, badly lighted, and unprotected from dampness? One serious weakness is to be found in many of the superior class of residences in suburbs usually regarded as fashionable. The kitchen offices are sunk in a soil reeking with sewer and gas effluvia, in which the drainage is bad. These rooms have wood floors raised above a soil which has not been covered by a layer of concrete or asphalte; the space under floors is generally imperfectly ventilated, for the air gratings are often stopped up or have been covered over, and the light admitted is often insufficient, necessitating gas the greater part of the day. The kitchen, the servants' hall, butler's pantry, and other offices are thus provided for in the least healthful portion of the house, and those who have to pass their time in them must suffer in consequence. The Metropolitan by-laws do not touch the evil of underground rooms in houses of this description. Lessees are constantly put to expense in matters of drainage. How frequently it happens that the basement floor has to be taken up throughout the whole depth of the house to find out a stopped drain or an imperfect joint which emits sewer-gas into the house! We have seen houses exposed to this inconvenient operation for several days, much to the injury of the health of the inmates. There is no such regulation as that of the model by-law requiring all drains under buildings to be embedded and covered with concrete, so that in the very heart of the Metropolis our sanitary precautions are worse than they are now in any town under urban sanitary authorities. Through want of proper ventilation under the floors, tenants are often exposed to another inconvenience and expense. The basement floors very rapidly decay, the floor-boards give way, especially if covered by linoleum or oilcloth, and even the joists decay so much that a new floor becomes almost indispensable in the course of a few years. We have known lessees of houses in Bloomsbury, Kensington, and Brixton, who have taken houses for the term of seven years, and have had to defray the cost of extensive floor repairs soon after occupation commenced—a point that is deserving of the serious attention of new tenants. Very flattering descriptions of houses to let are often given in the newspapers, which experience often shows to be most delusive. People take, on the bare recommendation of the house agent or farmer, premises which are really in a condition requiring a very general repair. No guarantee is asked for. A surveyor or sanitary expert's report at a trifling fee would set at rest all doubt, besides saving sometimes the cost of heavy repairs at the expiration of the term. Still, people who ought to know better, and whose knowledge of the world's financial and commercial transactions are not small, are constantly being made dupes by signing agreements with repairing covenants without having previously satisfied themselves of the real condition of the premises.

When legislation shall have made it necessary for every house-owner and builder to produce a certificate of efficiency and sanitary construction before letting, the ignorance and apathy of the ordinary tenant will not be attended with the disastrous consequences it now is. We had thought a measure of this kind was within a reasonable distance of realisation; but it seems not. The public can now only protect themselves by appealing to the sanitary authority, and we know the cost that many landlords have thus had to incur by complaints made by tenants whose moderate demands have been unheeded. In several instances within our knowledge the sanitary inspector, when called in, has ordered the whole drainage to be overhauled, and a perfect system adopted, including intercepting chambers and ventilators. The tenant has to put up with the annoyance of having his basement pulled up, drains examined, and additions made. The Public Health (London) Consolidation and Amendment Bills are a step in the right direction. Hitherto the provisions contained in numerous Acts have been neglected—there has been no authority to control details; but the amendment Bill consolidates and amends these provisions. The London County Council is constituted an authority for making all general by-laws which the vestries and district boards will have to see carried out. We may look, therefore, for greater uniformity of administration. The fittings of houses are as badly looked after as their construction. The modern plan of having inspection chambers with suitable channels to receive the branch drains, is only observed in newly-built houses of a superior kind; all the older buildings, and the small rental dwellings are treated in the old-fashioned manner of placing all drains and pipes out of sight. The new by-laws will regulate and control many of the internal arrangements, such as cisterns, water supply, waste and overflow pipes, traps, provision against siphonage, and other plumbers' fittings.

The resorts frequented by those who make holiday excursions are equally in need of supervision. Houses intended for single families, boarding-houses, and hotels at the fashionable seaside are yet without that inspection which ought to be made. A dwelling-house of three or four stories is occupied by as many families in addition to the rooms inhabited by the landlady. For the purpose of letting in floors, each story should be self-contained, with its own conveniences; but this is far from being the case. We have good evidence for believing that one-half the number of houses which receive visitors are totally unfit for the purpose. It may be useful to recall the suggestions issued by the Local Government Board respecting a humbler class of buildings — common lodging-houses—which rules apply to a certain extent to every house which is let out to visitors. These lodging-houses are under the control of the sanitary authority, and have to be inspected before they can be placed on the register, or certified to be fit for a certain number of lodgers. Why should lodging-houses of a superior kind be exempt from this control? Local by-laws are inadequate to meet the requirements, if we are to judge from the complaints made by visitors to many of our seaside places. The drainage is anything but perfect, and sometimes it is much interfered with by tidal conditions; the conveniences are inadequate, the rooms are not arranged for several separate families, and the means of communication are insufficient. The Local Government Board have laid it down that a common lodging-house should possess (1) the conditions of wholesomeness required for dwelling houses in general; and (2) it shoul arrangements fitting it for its special p of receiving a given number of lodger need not inquire into the first con which we may suppose has been fairl though in many of the houses let to f we may find the commonest precautio lected—such as that all waste pipes fro and cisterns discharge in the open a gullies, and the soil-pipe be ventilate should be sorry to say that the cistern clean or wholesome in all cases. The requirements are more frequently over The number of visitors received is no lated by any by-law having reference number and capacity of the sleeping and conveniences. We know a house over-crowded. With regard to bed how many of the attics are let out, no chimney opening, and only a window? Very often a bedroom is two or three persons, having a cubic c barely sufficient for one person. Fo mon lodging houses, the memorandu the effect that in sleeping rooms of o construction, where there are the means of ventilation by window chimneys, about 300 cubic feet wi proper quantity of space for each p but this space, as Mr. Gordon Sm said, is very small when compared w space allowed per person by the polic lations of Paris and Berlin, where th feet are 480 and 350ft. respectively. special requirements are sufficient and day-room accommodation, ref ceptacles, also a water suppl closet accommodation proportioned number of persons received. NONCONFORMIST CHURC BUILDING.*

By James Cubitt.

CHAPTER II.—GIVING INSTRUCTION DESIGNS.

THE first thing to be settled at th is, whether designs are to be from one architect, or from more th This, of course, it rests in each case promoters to decide; but, as a gener ciple, it is worth remarking that churc of any description, to be successful, special study and special knowledge. life is complex to an unprecedented and the business of every profess become complex in proportion. To it all is beyond the power of any being; and he who means to know a thoroughly is compelled, whether he no, to become more or less of a sp This is seen in all directions, but more clearly than amongst architect man, for instance, is a great auth ancient lights, or on dilapidations, trations, and other questions borde the law. Another knows all about and sewers, pumps and pans, pi water-supply. A third is familiar latest improvements in Board scho so finds ample employment in this age of State-supported education. have the city architect, who transfo older streets, and who makes the n what they are; and we have, again,

* All rights reserved.

rb architect, who gives us, now a pic-
ir quely-arranged group of roads and
ot ges, now a dismal desert of stucco, and
ov a long string of "villas," which look
s i they were manufactured by the mile.
le ly none of these men would be likely
t ce up with success the speciality of any
th , unless it were that of the last named;
nd none of them, with very rare excep-
on , could be expected to hit on any
m ovements, either practical or artistic,
I chance he found it his business to
es n a church. Nor is there much more
o hoped from the "general practi-
on r." It is no fault of his—it results
o the complexity of modern civilisation;
at till, it is a fact that to know a little of
re thing means, nowadays, to know but
tt of anything.

Te specialist, on the other hand, has his
wi dangers. In particular, he is not
ex pt from the common tendency of human
atre, to get into a groove, and stop there.
n it is therefore good for him, and good
r is work, that he should now and again
e used up, and put on his mettle, and made
o his best. In other words, it will not
im any harm, and it will probably do
s ildings much good, if he sometimes takes
r n an architectural competition. By this,
ourse, is meant a "limited" competition,
nned to three or four, or five or six
lted architects. Open competitions seldom
o well for buildings no bigger than an
re ge Nonconformist church. A great
a designs are sent in—but sent in chiefly
r he half-trained and the inexperienced.
re reason is, that where there are such a
u itude of competitors, the matter is not
o h the notice of any skilled architect with
stablished practice, and out of fifty or
x such designs the promoters will find less
ta l opportunity for choice than amongst
r or four submitted by men who really
kr what they about.

Supposing a limited competition to be
cl ed on, it is important to note the best
w of conducting it. The first step is to
ar are and issue the "Instructions" to
co petitors. Very much depends on these
ins uctions. There is one plain principle
w hich they should be based: they should
f full information about facts, but should
cl l, as much as possible, laying down
r rules. Some few rules, indeed, are
u oidable. It is necessary to make a rule
the scale for the plans, and as to the
t for receiving them; and, perhaps, also
the size of perspectives. The scale of
o an inch is the ordinary one for build-
g of moderate dimensions. A smaller one
suffice in the case of very large works;
a larger one is never necessary in com-
ti ions of the present class.

Te rules having been stated, the "In-
st tions" should go on to give the com-
or s information. This information will
ide a plan of the site, a statement about
kind and extent of the accommodation
ed, and about the sum which it is pro-
l to expend. Should the promoters
any suggestions to make about arrange-
, style, or points of detail, these should
dded, but added as suggestions only.
"Instructions," in short, should state all
main facts which would naturally in-
ce an architect in trying to work out
est scheme which circumstances would
t of. But they should not go on to
t that competitors should deal with the
in some particular way and no other.
very object of a competition is to get
ndependent advice of several architects;
this object will be frustrated if some
idea is imposed upon them all at the
t. And, beside this, it should be noted
the freedom which is given to competi-
in the way of submitting a variety of
estions, will be the measure of the com-
ee's freedom in choosing between those
estions. Take, for instance, the case of building materials. If the committee, in their instructions to competitors, make it a rule that their church must be faced with stone outside, or covered with plaster inside, they are binding themselves to reject any design showing a different treatment. And yet it may easily happen that a competitor will see good reason for proposing a different treatment, and that the committee themselves, when they see his design, will be convinced that he is in the right.

A fair amount of time should be allowed for thinking out designs. The question is not how long five or six sheets of plans will take to draw, but how long an architect may require to think over the new set of problems which each new building presents him with. More thought usually means more economy; less ornament, and more art; and this is the direction in which real progress is to be hoped for. Beauty of draughtsmanship is very attractive while a building exists only on paper; but thought and invention are the thing that will tell when the work has been executed.

For this reason, it is a mistake to insist on too many drawings. A plan of each principal floor will be required (if there are more floors than one); also a transverse and a longitudinal section, and an elevation of each principal front. But to make the design intelligible, it is very important also to allow of an interior and an exterior perspective view. A competition without perspectives is likely to be a competition decided by guess. Hardly any committee can realise the effect of an interior merely from plans and sections. Hardly any architect, even, can realise it, if there is any sort of originality or freshness about it, until he has first sketched it in perspective himself. And yet it is for the sake of the interior that the church is built.

There are only two classes of designers who have any motive for objecting to perspectives—those whose training has been so imperfect that they cannot make a perspective view, and those whose composition is so unsatisfactory that it will not bear exposing as perspective exposes it. It does not follow, by any means, that four passable elevations will make a satisfactory building. It is quite possible, on the contrary, that each may injure the others, instead of their all grouping together into an artistic whole. To draw them in perspective is the only way of finding out which is really the case. But it does not need a very large perspective to show this: and for many reasons, it would be well to make a rule that no perspective view submitted should be more than 18in. long or wide.

In former times there was, and sometimes is even now, much alarm about the supposed effects of colour and shading. Rules have been, and still are sometimes, made by which competitors must confine their elevations, and even their prospectives, to pure outline. Now, of all things vitally essential to good architecture, none are more important than the skilful management of light and shade. This is a point which every architect with any artistic sense is always thinking about, and trying to succeed in. It is a thing incomparably more important than mere ornament—a thing which, if successfully accomplished, will make up for the absence of ornament altogether. And yet it is a thing which, by such rules as these, an architect is forbidden to show even when he has secured it. The effect of this is to put the flattest and tamest composition on a level with the most effective one, as far as its chances in a competition are concerned. No wonder if the buildings produced under such a restriction turn out thin and paltry, meagre and tame.

What is true about shading is equally true about colouring. If we wanted to bring back the glories of 18th-century churchwardenism, when every church and every cathedral was whitewashed at frequent intervals, it would be natural enough to let nothing but black and white appear on our drawings. But the fact is that, especially in our cheapest buildings, nothing offers more opportunity for improvement than the colour-treatment of the interiors. So little has been done in this direction yet—for the painting of cast-iron columns bright blue, and the gilding of their capitals, is surely not an improvement, any more than the insertion of raw, staring stained-glass windows; and yet so much might be done, and done at so little cost, except the cost of thought and study. Yet when colour is prohibited in competition drawings, the promoters practically say to every architect, "No advance this way."

Suppose now that the competing designs are sent in. How is the best design most likely to be selected? Shall the committee act on their own judgment, or shall they appoint a professional assessor to help them to decide? Some years ago a considerable number of architects, impressed by the unsatisfactory results of various "open" or "unlimited" competitions, made an effort to improve them. With this view they bound themselves not to take part in any "open" competition unless a "professional adjudicator of established reputation" were appointed. It is particularly to be noted that the engagement thus voluntarily entered into, applied only to "open" competitions. It made no reference to "limited" ones, and did not at all imply that a professional adjudicator was necessary there. And this is not unreasonable. In an open competition, the number of designs submitted is often enormous. From twenty up to as many as two hundred sets of plans have been received in such cases. If each set only comprised five drawings, this would mean that from a hundred up to a thousand plans, elevations, and sections, needed careful study and comparison. The labour is immense, and the multiplicity bewildering. But it is not so with the small number of schemes submitted in a "limited" competition, especially for a building no larger than a church.

The weakest point in the above-named agreement was, perhaps, that which simply insisted on an "adjudicator of established reputation." For it does not in the least follow that an architect of established reputation in one branch of his profession is a suitable man to adjudicate in every other branch of it. The "sanitary" architect is not the best man to adjudicate on a design for a town-hall, nor the town-hall architect on one for a board-school, nor the board-school architect on one for a church. The adjudicator must be thoroughly at home in the particular class of work which he is called in to decide about. And this, again, leads to a serious difficulty. It may be possible, in the case, for example, of a Nonconformist church, to find an adjudicator who understands every detail involved, as well as any of the competitors. But this is not enough. It is of the first importance that the adjudicator should also be placed far above all personal motives in coming to his decision. He should not, for instance, be a "local" architect, whose clear interest it is to keep all outsiders of any ability from coming into his district. He must thoroughly understand Nonconformist church-building, and must therefore be more or less of a specialist, and yet he must have no rivalry with any other specialist in the same line who may be amongst the competitors. And he must not, like many people of "established reputation," be a man in a groove. He must be willing to recognise merit, in spite of its originality, and ready to advocate the adoption of a good idea, even though it happens to be a new one.

Here and there, no doubt, a highly-placed architect may be found who combines all these qualifications. But such a man's time is valuable, and his charges are naturally

high. And it cannot be too strongly insisted on, that it is such an adjudicator, or none, that is wanted. The adjudicator without special knowledge is a delusion, and the adjudicator with personal interests or personal enmities is a snare. However honourable and fair he may intend to be, he is in a radically false position. It is far better for the committee to take the matter into their own hands, to get all the light they can on the subject, and to do their best towards reaching a wise and just decision.

It may be useful to give, in concluding this chapter, an example of the sort of "Instructions" recommended for a limited competition. The clauses in brackets can be added or omitted at the discretion of the committee. Names, numbers, and dates are of course to be altered according to circumstances.

PROPOSED NONCONFORMIST CHURCH, WISCOMBE-ROAD, TREBY.—INSTRUCTIONS TO COMPETITORS.

RULES.

Rule 1.—The competition is limited to .... architects, who have been selected by the building committee.

Rule 2.—The architect whose design is adopted will be employed on the usual terms to arrange for and superintend the execution of the works.

[Rule 2*a*.—Each competitor who has conformed to the rules here stated will receive as an acknowledgment the sum of .... guineas.]

Rule 3.—The drawings required are a plan of each principal floor, a transverse and longitudinal section, and an elevation of each principal front. These drawings must be to a scale of 8ft. to an inch. One or more perspective views may also be sent, but no perspective view must be more than 18in. long or 18in. wide. This size is that of the picture itself, not including any plain margin or mount on which it may be placed. Drawings may be finished in any style—as regards colour and shading—which competitors prefer.

Rule 4.—The drawings must be delivered at the Wiscombe-road Lecture Hall, Treby, on or before ....

INFORMATION AND SUGGESTIONS.

1. A plan of the site, showing the dimensions, the levels, and the points of the compass is supplied herewith. The depths of the sewers, both on the Wiscombe-road and on Hill-street, at the side of the site, are also marked on this plan. The distance to which the frontage line on each street is required to be set back is also shown.

2. The committee wish to provide accommodation, in the first instance, for .... adults, allowing 20in. in width for each sitting, and arranging for the seats or pews to be 2ft. 9in. from centre to centre. It is desired that the church should ultimately be arranged to seat at least .... persons [and, as at present advised, the committee would prefer that all, or nearly all, should be placed on the ground-floor area]. The facilities for this future extension will therefore be taken into consideration in deciding between the various designs.

3. Two rooms, or "vestries," conveniently situated with regard to the pulpit, are required; also a larger room, containing about .... square feet, and well lighted, to be used for ladies' working meetings and similar purposes.

4. Space should be left on the site for a future Sunday-school and class-rooms (for .... scholars), and also for chapel-keeper's rooms, and the necessary offices for the school.

5. The special attention of competitors is requested to the need of so designing every part of the church, both present and future, that an average voice will be easily audible throughout. The arrangements proposed for warming, ventilation, and lighting should also be explained.

6. The sum it is proposed to expend in the first instance will not exceed £..... This includes the cost of the building, and that of the heating and lighting apparatus. The committee consider it very important that this sum should not be exceeded, and they do not undertake to carry out, or to pay for, any design which cannot be erected for this amount. [Should any competitor, therefore, think the choice inevitable, it is suggested that he should show a somewhat reduced amount of accommodation rather than exceed, to any material extent, the limit of cost just stated.]

Suggestions like these may, of course, be amplified and added to. The fixing of a limit to the size of perspectives, in Rule 3, is proposed with the intention of confining them to their proper use—that of explaining, as neither elevations nor sections can, what the building will actually look like. Views of very moderate size will suffice for this, and will not easily lend themselves to false and meretricious effects. The bad name which coloured perspective views have in some quarters obtained, is due mainly to the admission of very large and showily-treated drawings, which, by mere bigness and "loudness," have overpowered everything else. Rule 2a implies that any competitor who sends in views of a larger size than that prescribed, will forfeit the sum promised in acknowledgment of his trouble in preparing designs, and of his risk in competing; and perspectives which exceed the limit of 18in. in size should also be removed from view.

PRICES.—XV.*

[It will have to be borne in mind that the prices given do not include any provision for an increase in the cost of labour, should the men now on strike obtain the 10d. per hour; and contracts taken pending the strike should be entered into with caution, and ought to have a clause allowing an increase if the 10d. is paid, though it scarcely seems probable that it will be.]

MASON (*continued*).

There are several stones used in London and suburbs that have not been given in detail; following is a list.

Bolton Wood.—This is a durable stone easy to rk, and fine in grain; price, delivered within r miles of depot, and including builder's fit, 3s. 4d. per cubic foot.

Bramley Fall.—This is a Yorkshire stone. The rries are near Leeds. The stone is quarried very large blocks, and is a hard York, and ch used for templates and bases under iron; ce, 2s. 5d. delivered within four miles of ots, King's Cross or St. Pancras. This price ludes builder's profit, but not waste.

Caen.—This stone comes from Normandy; ce, delivered within four miles of depot, 2s. 6d. cubic foot, including profit, but not waste.

Darley Dale.—This quarry is near Matlock; ce, 3s. per foot cube delivered within four es, including the builder's profit.

Ham Hill.—This is considered a good weather ne, and is quarried in large sizes; price, ivered within four miles of Paddington tion, including builder's profit, 2s. 4d. per ic foot, and these and following prices do not lude anything beyond the items described.

Hare Hill.—This is a Yorkshire stone, softer n these given in detail in the early part of the son; price, delivered within four miles of ot, including builder's profit, 3s. 3d. per ic foot.

Idle Moor.—This is a Yorkshire stone, quarried r Bradford; price, delivered within four es, 3s. 3d. per foot cube, including profit.

Ketton.—This stone comes from Rutland; ce, 3s. per foot cube delivered within four es of King's Cross, including profit.

Matlock Bridge.—This is a Derby stone; e, 2s. 10d. delivered within four miles of ot, including profit.

Painswick.—This stone comes from Glouces- hire; price, 2s. 4d. delivered within four es, including profit.

Park Nook.—This is a Yorkshire stone, and is of the softer ones; price, delivered within r miles of depot, 2s. 10d. per foot cube.

Potter Newton.—This is also a Yorkshire e; price, 3s. 4d. per cube foot delivered hin four miles of depot, including profit.

Roche Abbey.—This is another York stone; price 10d. per cube foot, delivered within four miles epot, including profit.

Rotgate Head.—This is a Yorkshire stone, rried near Huddersfield; price 2s. 9d. per e foot, delivered within four miles of depot, uding profit.

Spinkwell and Cliffwood.—This is also a Yorkshire stone, quarried near Bradford; price, delivered within four miles of London depot, including profit, 3s. 6d. per foot cube.

PAVIOR.

Asphalte paving has already been given.
Wood-block paving will be given in Carpenter.
Concrete under pavings has already been given.
Blue brick tile, &c., were given in Bricklayer.
Cement paving will be given in Plasterer.

SLATER.

Sizes of slates used in covering roofs:—

Doubles 12in. by 6in., 1,200 (the slater's thousand) will cover about 2 squares at 2½in. lap, and weigh 12cwt.

Small Ladies 14in. by 8in., 1,200 will cover about 4 squares, and weigh about 20cwt.

Ladies 16in. by 8in., 1,200 will cover about 5 squares, and weigh 1¼ tons.

Small Countess 18in. by 10in., 1,200 will cover about 6¼ squares, and weigh about 1¾ tons.

Ditto 18in. by 9in., 1,200 will cover 5¾ squares, and weigh about 32cwt.

Countess 20in. by 10in., 1,200 will cover about 7 squares, and weigh about 2 tons.

Duchess 24in. by 12in., 1,200 will cover about 10 squares, and weigh 3 tons.

Ditto 22in. by 12in., 1,200 will cover about 9½ squares, and weigh 2¾ tons.

Ditto 22in. by 11in., 1,200 will cover about 9 squares, and weigh 51cwt.

There are a few other sizes that are very seldom used, *i.e.*, queens, imperials, rags, 16in. by 10in., called wide ladies, cover 5½ squares, and weigh 1½ tons; 20in. by 12in. cover 8¾ squares, and weigh 2½ tons per 1,200.

Best Bangor slating to roofs, 2½in. lap, and 1½in. zinc nails, including profit.

Herr Carl Hilgers, the sculptor, who sent in one of the models for a National Monument to the late Emperor William, has been awarded a prize of 12,000 marks in addition to the 4,000 marks assured to each of the competitors.

The foundation stone of SS. Mary's and Edward's, Silvertown, was solemnly laid last week. The building is to be of Classic design, measuring 103ft. by 52ft., and is designed by Mr. F. W. Tasker. It will cost £5,000 to complete. The foundations are 23ft. deep, and one-tenth of the outlay will be absorbed by them.

SUSSEX TOWERS.

FOR quietness and repose the churches of Sussex are almost unique. In Yorkshire, Northamptonshire, the Eastern Counties, and also in Somersetshire we see edifices of a certain dignified proportion of stone or flint and brick, with lengthened naves and chancels, with aisles, and often with transepts of small projection, and with towers and spires of handsome and stately outline, sometimes over the crossing, but oftener rising at the west end to a considerable altitude. But in Sussex a very different type is presented, much more simple and unpretentious in style, and frequently small churches of cruciform plan, with a low, square central tower, like those of Broadwater, Poynings, or Alfriston, and these are often Perpendicular in style, though by no means without features of other periods. Many of these churches are built of flint masonry, and have tiled roofs, materials which perfectly harmonise with the foliage and rural surroundings, and appear to have grown, as it were, with the landscape. Simple and unpretending as they are, they possess features and peculiarities of interest. One of these is the tower, which is generally central and low, exceedingly plain, pierced by small openings, and surrounted by an embattled parapet, of which the small church at Poynings may be taken as an example. Broadwater Church, near Worthing, the mother church of the parish, has one of these low, central towers embattled, pierced on each side by a couple of Transitional Norman windows, while in the same vicinity are two other interesting structures. One is the ancient church of Sompting, a cruciform edifice with a square west tower, well known to all students of Mediæval architecture as being one of the few types of tower of supposed Saxon date. The sides terminate in gables, and a low roof of square pyramidal form, set with its hips or angles coincident with the spires of the gables, crown them. This mode of roofing a tower is, no doubt, a primitive one, and is adopted in many of the German towers. The other church, of West Tarring, is also an interesting structure of Early English features, with a western tower of considerable size, pierced with windows of Perpendicular date. It is surmounted by a shingle spire, and has an embattled parapet. The south side has a square projecting staircase finished level with the top of parapet.

In the present brief article we confine our readers' attention to one or two kinds of towers which characterise this district, and which possess features of a little more interest than are generally found. The first of these, of which we give a rough sketch (I.), represents the shingle spire of a small flint church at Keymer, near Hassock's Gate station. The church itself is modern, with the exception of a Norman circular apse. The tower has a restored appearance, and is of flint and stone. Above the flint walls, the broach of spire assumes the shape of a truncated pyramid, and is of tile with louvre ventilators, as shown; above rises a small octagonal broached spire of shingle. The general effect of this little spire is exceedingly simple, and is obviously characteristic. It is a very picturesque object as the visitor approaches it by the road to Ditchling, and may afford the architect a good model for the termination of a village church tower. The village of Ditchling possesses a cruciform church of very picturesque outline and exceeding simplicity. It has a Transitional nave and aisle, the latter, as our sketch shows (II.), being a continuation of the nave roof. The church is built of flint, with tiled roofs; the nave is of three bays length, with windows of Decorated character. The chancel is pierced by three lancets at the sides, and the east end has a three-light Geometrical window of three cusped circles, and the south aisle has a Late Decorated window of three lights. The south transept has a Late Perpendicular three-light window. But the principal external feature is the central tower, plastere its low pyramidal spire and louvres (see a termination which combines extreme si with appropriateness of character. In this tion the architectural tourist will find interest him in a picturesque old timber on the opposite side of the road, which has of circular cut pieces and a good brick chi

A tower and spire of more pretension, good outline, is that of Southwick on the line from Brighton to Portsmou Sketch III.), backed by thick foliage tower, of flint and stone, has a slightly lower story with two sets off, which giv agreeable profile. It is built of flint with dressings at the angles, and the and Transitional windows are filled wi work. The jambs to the lower windo Norman pillars and capitals (*b*), and the effective corbelling to tower (*a*). The sp shingle, and is boldly broached at the spi The church has a nave and aisles withou of architectural interest except a nice dicular chancel screen and a painted wi the Crucifixion. The general view church, amidst its background of t pleasing and picturesque.

One point of interest is apparent in a towers, the influence of material. Fl suggested a treatment very much more than would have been the case had the offered abundant stone. In Somers Gloucestershire, and Lincolnshire we result of abundant supplies of freestone. was prodigally used throughout for wall dressings alike, and the architect and both devoted their skill to working in a that offered such facilities; elaborate ling and relief ornaments were the result. thought and designed in stone. On the co a chalk district offered nothing but flin hard and intractable to cut, too small to courses, and the very hardness and diffic

orking became inseparable factors in restrict-g design. Plainness of wall-surface followed a matter of course, and the only ornamental atures were the insertion of a few simply-eated traceried windows. In Norfolk and affolk the flint-work is combined with brick in manner at once architectural and decorative, d some of the noble flush-work towers we may ention in another article.

RESIDENCE, HEATHFIELD, SUSSEX.

THIS property, which originally consisted of a pair of cottages, is now being con-derably altered and enlarged as a country sidence. It is charmingly situated on an evated site, and commands fine views of the rrounding country.

The additions are constructed with red bricks, athstone dressings, bright red weather tiling, alf-timber and cement and shingle rough-cast, he roof being covered with dark tiles.

The works are being carried out by Mr. Piper, uilder, of Punnett's Town, Heathfield, under he superintendence of Mr. H. Percy Monckton, .R.I.B.A., of 32, Walbrook, E.C.

REPORT OF THE ROYAL ARCHITECTURAL MUSEUM.

THERE has been an increase of nearly 54 per cent. in the amount of the students' fees uring the past year at the Royal Architectural Iuseum, Westminster, showing an advance of 238 9s. 6d. for the sessions of 1890, and bringing p the fees to £681 14s. In 1886 they only mounted to £123 7s. 9d., since which time a teady advance has been made. In the examina-ions, the result of the school's work has, accord-ng to the report issued to subscribers this week, een most successful. In the drawing from the ife, 28 passed out of 30 candidates. Of these, 3 ecured honours, 6 first class, and 19 second class. Shading from the model and from casts is not nuch in favour at these classes in Tufton-street, nd we note with regret that perspective and reehand draughtsmanship are on the wane in the chool, showing an absence of energy among the lementary students. The fees for these subjects eing so low by the Departmental regulation, nd the grants from South Kensington on their ccount being also very small, no encouragement s afforded to the masters to develop such tuition. The general character of the school at West-minster has, notwithstanding, never been better than it is at the present time, as the above figures undoubtedly demonstrate. The subscriptions to the Institution, however, show a marked decrease, which very seriously interferes with the possibilities of extended usefulness. The classes are so crowded that competition has to be resorted to in order that an entry may be obtained by those who, in excess of the accommodation, are seeking admission. The subscriptions, which ten years ago exceeded £200, were last year brought down to £117 4s. Many old friends of the museum have been removed by death, and additional subscribers are much wanted, with a view to further developing the class accommodation of the school, which has been greatly increased during the last five years. The Science and Art Department decline to aid the school in this direction unless the freehold, worth many thousands of pounds, is handed over to that authority. A grant of about £200 might then be made. The idea is too absurd for consideration. Mr. Fred Brown is the head master still, and in the place of the late Mr. R. A. Ledward, Mr. Fred E. E. Schenck has been appointed modelling master. It is satisfactory to record that a fund of between £1,000 and £1,200 was raised by the brother artists and friends of the late master for the benefit of his widow and children. The income of the Royal Architectural Museum and School of Art during the past year amounted to £1,251 17s.

THE BRITISH ASSOCIATION MEETINGS.

THE proceedings at the meetings of the British Association held during the past week at Cardiff have been rather dull altogether, and singularly devoid of interest so far as architects are directly concerned. Dr. Huggins's presidential address dealt in a highly technical manner with the minutiæ and results of spectrum analyses. Sir E. J. Reed, M.P., advertised his scheme for a tubular railway on the bed of the English Channel, which was criticised by Messrs. Abernethy and Greathead, Sir B. Baker, and other experts as costly and out of all proportion to the amount of work to be done. Mr. W. Furnivall, C.E., in a paper on "Indian Railway Communication," explained that 16,277 miles are now open to traffic, of which about two-thirds are on the standard gauge of 5ft. 6in. and the remainder on a narrower gauge. The cost of the latter was about half that of the broad-gauge lines, but the returns were almost alike for both. He claimed that Indian railways had been well laid out and well built, and showed that their demands on England for iron and steel equalled one-tenth of all English exports last year. Mr. William Key, of Glasgow, described "The Ventilating and Heating by Mechanical Means of the Victoria Infirmary, Glasgow." He explained that the building was constructed without fireplaces or steam-pipe heating apparatus. The air was drawn from a shaft 10ft. above the ground, and, after passing through a screen of damp hemp and hair, was purified. It entered a chamber which was heated by hydraulic coils, and thence passed into the various wards and administrative offices. Arrangements were made by which the temperature of each or all of the wards could be regulated to suit the needs of patients, and the atmosphere was entirely renewed at least six times an hour. In a discussion which followed, Sir Douglas Galton commented on the advantages of the system, Sir Frederick Bramwell adversely criticised the use of damp screens, which, he contended, would saturate the air which was admitted, and Mr. A. R. Binnie and Mr. J. Head also spoke. "A New Method for the Disposal of Sewage" was described by Mr. C. G. Moor, the only novelty being in the manner in which the sludge cake produced by any precipitation process might be converted into marketable products. This treatment had been practically tested at experimental works at Leyton. In the Anthropological Section, papers were read by Mr. Edwin Seward, R.C.A., of Cardiff, on "The Formation of a Record of Prehistoric Remains in Glamorganshire," now in progress under the auspices of the Cardiff Naturalists' Society, and Dr. J. S. Phené one on "Recent Hittite Discoveries," the doctor's theories being severely handled in a subsequent discussion. Mr. A. R. Bennett's paper on an electrical parcel exchange system by means of miniature electric railways laid in underground pipes gave rise to a warm controversy, in which Sir Frederick Bramwell (who maintained that a tube or tunnel under a street could not be made for less than £15 to £20 per lineal yard), Mr. A. R. Binnie, Mr. Greathead, and Professor A. E. Elliot raised objections to the cost and inconvenience that would be involved by the construction of the proposed tubular lines. Full reports of the proceedings at the congress appear in the last and current issues of the *English Mechanic and World of Science*—those for August 21 and 28.

DESIGNS FOR THE NEW SOUTH KENSINGTON MUSEUM BUILDINGS SUBMITTED BY THOMAS N. DEANE AND SON, AND WILLIAM YOUNG.—GRAND HOTEL, CROMER.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.—RESIDENCE, HEATHFIELD, SUSSEX.—NEW BOARD SCHOOL, WATFORD.—STABLES AND OFFICES, KILLINEY.

Our Illustrations.

SOUTH KENSINGTON MUSEUM COMPETITION.

In continuation of our series of illustrations of the designs submitted for the completion of the Museum buildings at South Kensington, we publish this week the perspectives and plans of those sent in by Sir Thomas N. Deane and Son, and by Mr. William Young.

THE GRAND HOTEL AT CROMER.

The Grand Hotel at Cromer, the construction of which has occupied a little over twelve months, cost, with the fixtures, about £15,000. It was opened last week. The building is situated on the Runton-road, near the cliff, with a frontage of 180ft., immediately facing the sea, and stands upon some of the highest ground in Cromer. The hotel is in red brick, with stone dressings, and the roof is covered with green slates, surmounted by ridge cresting and a central turret. The principal entrance is in the centre under a portico, approached by steps. On either side of the portico is a bay window, running up three stories. Balconies run along almost the entire front on the first-floor level, and there are other balconies. Entering the building, we find ourselves in a spacious entrance hall, 45ft. long by 22ft. wide, and 14ft. 6in. high, lighted by three large stained-glass windows reaching from floor to ceiling. The floor is laid with solid oak parquetry, and the walls are hung with the new wall hanging called "Anaglypta." There is a high dado of reeded pattern, coloured in a dark shade of cool grey-green. Above the dado rail the "filling" is a rich brown red, with gilt relief in a Japanese style, and above the picture rail a frieze of a lighter red tint in high relief, with sea-horses, dolphins, &c., for the decoration. The woodwork of the hall is walnut throughout. Facing the main entrance is the manager's room, and towards the left hand, connected with this, is the hotel bureau, or inquiry office. On the right hand is the grand staircase leading up to all the floors, constructed of polished walnut with teak treads and risers. The stairs are 6ft. broad, and ascend by easy flights to the various floors. The staircase is lighted by stained-glass windows. The dining-hall occupies the whole east wing of the building. It is 55ft. long by 34ft. wide, with a solid oak and walnut parquet floor, the walls being hung to the dado line with "Anaglypta" of a deep maroon colour. Above the dado the walls are green and gold, and above the picture rail is a similar frieze in lighter tones. The piers forming the walls of the hall into bays are faced with alabaster pilasters of rich brown-red colour, with gilded caps and bases. The ceiling is coffered and enriched. The windows are fitted with plate glass, and stained glass for the upper portions. There are three fireplaces, with walnut chimneypieces. Opposite the dining-hall is the drawing-room, 38ft. long by 20ft. wide, lighted by three large semi-circular headed windows. The dado is of a pale grey-green, and the wall above is of cream, with highly embossed gold pattern on it, and the frieze is of decorated "Anaglypta." There are two fireplaces, one at each end of the room, in carved woodwork. The reading-room and private sitting-room, and the smoking and billiard rooms, have been purposely relegated to the extreme west of the building, so as to be almost completely cut off from the rest of the hotel. The smoking-room is 30ft. long by 18ft. wide, and has an angle turret, from the windows of which sea and land views are obtainable. The walls are hung with Spanish leather wall-hanging, and the frieze is in high relief, richly decorated. The woodwork is coloured in peacock blues and greens, the ceilings being ribbed. The gasfittings are of wrought-iron and copper, and a lamp of Moorish design will light the arched recess. Between the billiard-room and smoking-room a small bar has been arranged so as to serve both rooms direct. The billiard-room is lofty, with an open roof and lantern light 36ft. long by 28ft. wide, and 15ft. to the tie beam. Adjoining the billiard-room is a porter's or luggage room and the luggage lift. There is also a door which leads to the tennis court and stabling, and the gentlemen's lavatory is adjacent. The kitchen is central and at the rear, large and well lighted, with open roof. The laundry, also at the rear, is elaborately fitted by Bradfords of London, and every provision is made so that no smells or vapour shall enter the building from the departments of service. The building is served with water from the Cromer Waterworks, besides which the hotel has a private well of its own, with force pump to fill the 1,000-gallon tank at the top of the building. Fire hydrants and hose are provided on each floor for the protection of the building. A passenger luggage lift works from the basement to the top floor, and a service stairs is likewise provided. The contract for the work has been carried out by Messrs. J. Youngs and Sons, contractors, of Norwich. The carved brickwork was executed by Mr. Minns, of Norwich, and came, together with the moulded brickwork, from the works of Mr. George Gunton, of Costessey. The parquet flooring was laid by Messrs. Turpin, of London. The heating apparatus is by Heim, of London and Vienna. The stoves and ranges, and most of the chimney-pieces, tile mantels, and fenders, with hot-water apparatus throughout, were supplied by Messrs. Theobald, Johnson, and Burton, of Norwich. The stained glass and decorative painting have been executed by Messrs. J. and J. King, of St. Andrew's, Norwich. Mr. Pank has supplied the gasfittings and electric bells, and Messrs. Sturgess and Towlson the luggage and dinner lifts. The architects are Messrs. G. J. and F. W. Skipper, of Opie-street, Norwich.

SKETCHES NEAR LUDLOW.

In conclusion we print to-day our last sheet of sketches illustrative of the historic architecture of Shropshire in connection with our report of the excursion of the Architectural Association, finished last week. The subjects chosen are from places near Ludlow, and they show either porches or gateways. The plate of drawings begins with the gatehouse of Bromfield Priory, near Ludlow, standing under the shadow of tall Scotch firs, leading to the grey old Priory church. The lower part of the gateway is contemporary with the church, Early English in style, and the timbered upper part is, of course, later. The windows have been much modernised, and the building is used now as a school. The church has a rare history, and is worth seeing. Knighton, still on the Teme, which hereabouts divides the counties of Radnor and Salop, is chiefly remarkable for the old mansions in the town, where the Brydges and the Crowthers once made a name. We give a sketch of the venerable and unrestored porch to the otherwise not attractive church. The woodwork, though patched, is boldly treated, and the porch is of good design. The last two sketches are from Weobley, where Ley's Farm (the porch of which figures at the foot of the plate) is one of the several decayed old houses still to be seen, illustrating work from the 14th, 15th, and 16th centuries. This doorway is dated 1589. The barge boards of the building are specially rich and well designed. A set of measured drawings of the building and some details will be found in Vol. X. of the old series of the "Architectural Association Sketchbook."

WATFORD BOARD SCHOOLS.

These schools, now finished, give accommodat for 140 boys, 140 girls, and 100 infants. infants' school is in the centre, with the b and girls' departments on either side, each be distinct and complete in itself. The classro are divided from the main schools by slid glazed screens, to allow rooms to be used sep ately or as one, as occasion may require. teachers' room is provided for boys' and gi departments, with fireplace and cupboard. seating is on the dual system; the schools heated by open fireplaces, supplied by Mr. Sh land, of Manchester; and fresh warmed ai brought into corridors and cloak rooms f these stoves; cold fresh air is admitted on Tobi system to all rooms. The walls are faced ternally and internally with picked local stoc with red bricks for quoins, cornices, and moul work. A dado inside is provided 4ft. high Keen's cement, and painted. The floors are Lowe's solid wood blocks on concrete. Cl rooms, lavatories, and passages have Stua granite concrete. All the internal woodwor stained and varnished, and the outside pain white. The work has been carefully carried by Messrs. Waterman, builders, of Watfo The architects are Messrs. Ayres and Ardron, 8, Southampton-street, W.C., and Watford.

STABLES AND OFFICES AT KILLINEY.

These are situated on the top of a hill a most picturesque position, and are built granite-rubble with red brick dressings first story, and upper is built in half-timb Plans show arrangement. The stables are fit with Messrs. Musgrave and Co.'s, of Belfa best fittings, the sheeting being of teak, and walls tiled. The cow-house is also fitted Messrs. Musgrave, and lighted by electric lig They are from the designs of Mr. Albert Murray, F.R.I.B.A., architect, of 37, Daws street, Dublin, and were erected under his sup intendence.

CHIPS.

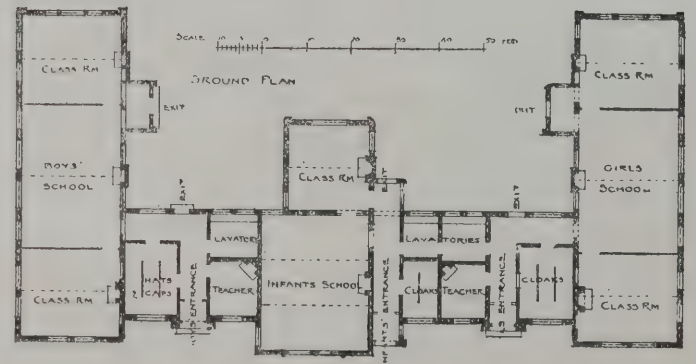
Mr. Clement Hughes, assistant surveyor to Aston Manor local board, committed suicide Friday by shooting himself on the lawn in front his mother's house at Woodsetton, Sedgley. ceased, who was 26 years of age, had but recen returned from Australia.

At specially convened meetings of the local bo of Clevedon, Somerset, held on Friday, to expe the reconstruction of the pier-head and carry the contemplated improvements, it was decided invite tenders from five eminent firms (three su gested by the engineer, Mr. Abernethy, and t suggested by members of the board). It was a decided to make the pier complete in every de by the providing of boating steps, a pavilion, & at a considerable additional outlay to that origina contemplated.

A commencement was made last week at Eri Kent, with the erection of the buildings which to be put up for the firm of Messrs. Fraser a Chalmers, marine engineers, who are also the pr prietors of extensive works at Chicago. The s comprises 17 acres.

Mr. Onslow Ford, A.R.A., is at work upon memorial to Percy Bysshe Shelley, the poet, tended for the Protestant Cemetery at Rome. T poet will be represented as he was found after t boat accident, when he was washed ashore near V Reggio.

A new peal of tubular bells has just been erect in the steeple of St. Giles's Cathedral, Edinburg A previous peal of similar bells, supplied by Mess Harrington, Latham, and Co., Coventry, we found to be too light for the position in whi it was placed in the middle of the city, and t peal, from the works of the same firm, is of heavier type, and has a deeper note. It consi of 13 bells, attuned in the key of A flat. The be are suspended, as were the old peal, in a louvr apartment below the ribs of the crown, and s rung from a chamber below by ropes, which c be manipulated by a single person.



A memorial drinking fountain at Westal Gree Lansdown, near Cheltenham, was accepted as gift to the town last week by the mayor. It h been designed and erected by Mr. A. B. Wall, Cheltenham, is Fourteenth-Century Gothic in sty and rises to a height of 22ft. from the ground.

An organ, erected by Lady Brooke in Lit Easton Church to the memory of her stepfath the late Earl of Rosslyn, was opened on Wednesd week. The organ, which occupies the greater p of the north transept, has been built by Mess Norman and Beard, of Norwich.

WAYSIDE NOTES.

NOTHER cathedral competition, and again in America! This time, however, it is British territory. The inhabitants of the edingly prosperous town of Victoria, B.C., are ous of possessing a cathedral, and advertise- ts for a competition have been put before the itectural profession, not only in British mbia, but also in the Old Country. There ld be a liberal response. Premiums of ous sums of dollars equivalent to amounts of , £100, and £50 are offered, and there is no trance fee." Here is a chance for anyone, genius half-stifled by poverty will be able to the freely, and not suffer total extinction for lack of the guinea that is now so frequently anded by competition promoters. The itious pupil may diligently apply himself to task of supplying the Victorians with a able and handsome cathedral, and that with- the necessity for laying out any pocket- ey other than such as is required for divers ts of drawing-paper and the various stretcher- nes, cost of freight, &c. He can get a hand n the office-boy in the evening to "black-in" r which task no better assistant can be found, ong as he keeps the ink within the lines and his nose and cheeks—and I am sure "the rnor" will readily "invest the designs n artistic merit." *Mem.*: "Belt *v.* Lawes," n a few masterly touches—that is, if he does spoil the whole thing.

eriously, the proposed cathedral-church for toria will in all probability be a fine struc- e, such as would be a credit to any town, ne or colonial. Victoria has developed so idly and yet so surely that the inhabitants not be satisfied with that type of Gothic ich we—most likely in great ignorance— gine to be the only wear in the colonies. e present town of Victoria B.C. is, in many ses, a model colonial city. It is free of the gus-like growths that distinguish the towns, pure American soil, that jump into cities in hteen months, more or less. The develop- nt of Victoria has been gradual and solid, and prosperity, therefore, rests on a sound basis. e "booms" and consequent succeeding periods lepression that characterise the Yankee mush- m "city" have never been a feature in toria. Consequently, the visitor to Victoria he present time would find not only that the le and commerce of the place were uniformly rishing, but that there are many really fine ldings in the streets, and that substantial uctures everywhere abound. To be aware of s fact may be useful to the intending com- itor for the proposed cathedral-church, as he y then be on his guard against the delusion t any inferior work will do for a colony, and row his whole energies into the designs.

I should much have liked to have seen "the ench war-ships speed over" the other day, and bsequently to have examined them at anchor. t that they have any great intrinsic beauty ner of outline or detail, seeming, according to awings and general account, ugly monsters ough. But I read that they have one feature nich seems to be a direct descendant from the turesque old galleon. Round the captain's oin at the stern, in several, if not all, of the ssels, runs a gallery or balcony—an appendage t only pleasant and useful to the commanders the ships, but also capable of artistic treat- ent. I believe a similar feature is appended to e or two English men-of-war that have been unched within the past year or so. There is tle hope for the picturesque about the modern nclad, although, for my own part, I am always ady to see beauty of a sort in a monitor, a comotive, or a bicycle, as indicating the honest aptation of means to an end, and embodying spectively expressions of power, speed, and etness. Some little might be done with these miral's, or captain's, balconies round the stern the warship. It was the tiers of open, lcony-like windows round the stern of the ediæval three-decker that gave her an incom- rable picturesqueness.

I have recently been much delighted with the llection of paintings of sea-fights at the Naval xhibition. Many of the pictures show a orious type of vessel, with great towering oops, with tier upon tier of windows—a regular oating architectural façade, that carries one's mind back to the days of Amyas Leigh and Don Guzman de Zoto. Truly magnificent objects must have been some of these early English war-ships and Spanish galleons, and right well have many of the painters caught the spirit of the ships in action, with their broadsides of port-holes, their high carved and gilded sterns, tall masts and flowing sails, half-hidden in the clouds of powder-smoke, and lurid in the flames of some burning enemy's vessel. The sight of a ship of the ancient pattern in full sail is one that later generations can know not. The old English line-of-battle ships—such as the *Victory*, *Marlborough*, and *Royal Sovereign*—in full sail must have been a sight the loss of which the present era has to mourn; but even this cannot have been comparable in point of pictuesqueness with the earlier boats, from Columbus's time upwards. I have seen a training brig of the old type sail out of Portsmouth Harbour. Finer sight on the water I have never seen; but the spectacle cannot be compared to the sailing of the mighty "hearts of oak," let alone to the high-pooped vessels of the Middle Ages plough-ing the Spanish Main.

The Royal Archæological Institute indulged in a little diversion of the "Bill Stumps, his mark" kind, whilst visiting some old Scotch work the other day. On many of the stones of the nave, both internally and externally, of the Church of the Holy Rood, at Stirling, are certain small circular incisions, disposed in the form of a Greek cross. Each circle is about 1in. in diameter, and the marks puzzled the visitors much—so much that we shall perhaps have a "great R. A. I. question," similar to the "Pick-wickian controversy" concerning Bill Stumps' mark, and a similar correspondence between various learned societies, and translations into all the known tongues of the globe, including "Billingsgate." The members of the Congress agreed that the marks could not be masons' marks, although, according to the *Athenæum* report, no true light can be thrown upon the question. I am sorry that I can be of no assistance, although I would venture to suggest that a cross is intended to be represented, and to hint that perhaps they were inscribed on the stones by some pious mason who, believing with good Thomas-à-Kempis that life is signed on all sides by crosses, thought that a few more or less would not matter.

The proposed observatory on the summit of Mont Blanc, to which I recently alluded, has been commenced in earnest, though, as might be expected, with much difficulty. Within a short time of the commencement of operations—the boring of the horizontal tunnel—the work-men became disheartened by the cold and difficulties, and, according to Wednes-day's *Times*, have only been kept to work by the offer of increased pay. Three of the men have had their feet and hands frost-bitten. Snowstorms cause great trouble, and all have suffered much from the cold, which may be believed when snow falls in one night to a depth of 1ft. 8in., and a sheet of ice covers the window of the temporary shelter-hut. No definite intelligence is yet forthcoming as to the depth of the ice and snow covering to the mountain-top; but M. Imfeld, the Swiss engineer engaged on the work, thinks, after the examinations he has made, that the rock would be met with a little below the top, and at no very great depth under the icy covering. At one place he says that the rock can be discovered at the depth of one mètre. M. Eiffel, the French engineer, thinks that the undertaking will not be practicable if the snow and ice are more than 12 mètres deep. M. Imfeld, therefore, is driving a heading into the ice on the north slope of the mountain, where the side is the most abrupt, and will require a shorter length of tunnel to reach the rock. When this has been accomplished, he proposes to bore to the east and west to ascertain whether the original boring has been made in a hollow, and that rock is not to be found on either side. Notwithstanding the difficulties attending the work, the latest reports say that it is progressing satisfactorily. Of the band of men who wished to leave the work, only one has refused to remain on the new terms.

A free-born "Amurrican" citizen gave it as his opinion in the train the other day that it was a mistake to have located the great "World's Fair"—destined to lick creation—at Chicago, and that it should have been holden at New York, in which opinion I agree with him, seeing that visitors from Eu-rope will have to traverse, in round numbers, one thousand miles by rail-way when they arrive in New York, in addition to the ocean voyage. No doubt but what the grandeur of the show—certain to exceed "the greatest show on airth" of the late P. T. Barnum, or it would not be worth much—will repay the extra time and trouble taken to get to Chicago; still, it must have occurred to many, with our American friend, that New York was the proper place. It won't much matter where the show is held to most of us, nor to the fortunate individuals who have time and money always on the hands. Many business men there will be to whom the extra distance may act as a deterrent; but per-haps the Americans themselves will gain, and Chicago be found a more central and suitable position than any in the States. I see that a model of Shakespeare's birthplace is to be set up at the exhibition, an architect having been com-missioned to measure up the "premises"—if one may use such a matter-of-fact term to describe the birthplace of the immortal bard—with a view to their reproduction at Chicago. The feature, if carried out well, should be popular with our cousins.

GOTH.

CHIPS.

The horse block in the High Bullen, Wednesbury, from which John Wesley preached 45 sermons during his 27 visits to the town, has been handed for preservation to the trustees of Spring Head Wesleyan Chapel, by the Directors of the Crown Tube Works, who are building on the site. It is suggested that a statue of Wesley should be erected on the block, which is to be placed in Spring Head Chapel grounds.

A window in the town hall of Kirkwall is about to be filled with stained glass, representing King James III., and a second one will contain Earl Henry St. Clair, with the Lerwick and Shetland coats of arms. Messrs. Ballantine and Son, of Edin-burgh, are the artists.

A cruciform chapel, connected by a glazed corridor with the adjoining mansion, is now being erected from the designs of Mr. A. E. Purdie in the Italian Renaissance style at Hothorpe Hall, for Mr. C. E. de Trafford. The roof to nave and chancel will be semicircular, divided into rich panels, the main divisional ribs springing from ornamental pilasters, the flooring of the nave in Duffy's oak wood blocks, and that of chancel in Italian mosaic. The whole of the joiners' work, including seats, confessional, and other fittings, will be in oak. The high altar and reredos to circular apse of chancel are in Caen stone, alabaster, and marble. The gilt safe *repoussé* work door is by Messrs. Hardman and Co., as are also the stained-glass windows.

A Ford Memorial Hall and Conservative Club is being erected at the corner of East-street and Mill-lane, Bedminster, Bristol. The chief room will accommodate 500 persons, and will have an open timber roof, with ornamental glass windows. The style of the building will be Renaissance, with con-siderable ornamentation where seen from Mill-lane. The walls will be constructed entirely of brick, with freestone dressings. The contractor is Mr. A. J. Beavan, of Bedminster, the architect being Mr. W. V. Gough, of Bridge-street, Bristol.

A cairn at Harelaw, Kinross-shire, was opened on Saturday by Mr. Constable, of Glencraig, when a cist was formed in which was a small clay urn, having a series of five handles projecting from a flange near the rim.

The Corporation of Manchester, who decided three weeks since to demolish the characteristic 18th-century tower of St. Mary's Church, Deans-gate, received, on Friday, a letter from Mr. Henry Boddington, offering to purchase and present to the city, as a free gift, the tower, on condition that it shall stand for twelve months. The Parks Com-mittee visited the site the same afternoon, accom-panied by Mr. Allison, the city surveyor, and unananimously decided to decline the generous offer, and to pull the tower down. The church itself was removed some time since.

The Board of Guardians for Elham, East Kent, adopted last week plans by Mr. Joseph Gardner, of Folkestone, for cottage homes, estimated to cost £1,400.

New business premises are being built at the corner of New-road and the Market-place, Willen-hall, for the Birmingham and Metropolitan Bank, from plans by Mr. B. Baker, the town surveyor.

A parsonage is about to be built at Kenbig Hill, near Bridgend, from plans by Messrs. Halliday and Anderson, of Cardiff.

HOT-WATER ENGINEERING.—XII.

Supply of Hot Water for Baths and Domestic Purposes.

MODIFICATIONS OF THE CYLINDER SYSTEM.

PERHAPS one of the most useful of the modified forms of cylinder apparatus is that in which two reservoirs are used, a cylinder and a tank, both in their usual respective places. The writer has called this a cylinder apparatus for convenience, although it is just as much entitled to be called the tank system; perhaps the Dual system would be more correct, if a proper name is required for it.

Fig. 35 illustrates this apparatus, and one of the first things to be noticed is that the objectionable "third pipe" of the cylinder system, the cold supply-pipe which has to be carried from top to bottom of the building, is almost done away with: it is but a few feet in length, the same as in the tank system. The reason that the cold supply pipe may be taken into the tank with as good results as taking it into the cylinder, will doubtless be obvious to those who have read the articles preceding this. When a tap is opened the cold water will enter the tank, and partly (about half) pass down the secondary return to the cylinder, the other half entering the tank and going to urge the hot water up to the flow-pipe, down which it passes towards the

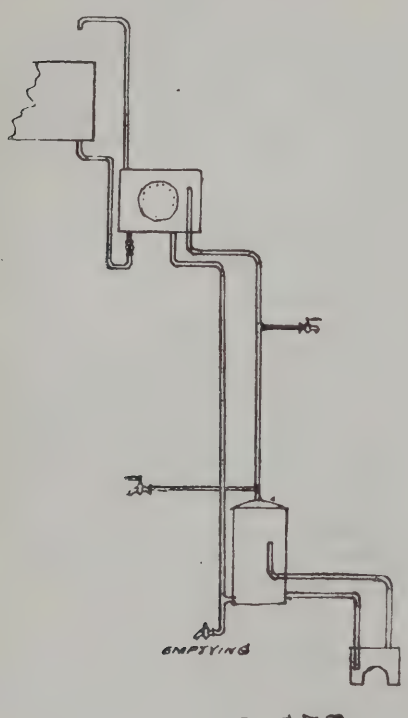

FIG 35

tap. The action is a little complex; but, of course, quite certain and regular, and is plainly shown by the arrows on Fig. 36. The arrows indicate the passage of water from the cold-water cistern when a tap is opened.

This system may doubtless become more in vogue when once the average hot-water fitter grasps the principle. The cost is but little, if any more, as it has to be particularly pointed out that in using two reservoirs, care must be exercised not to have them both of full or normal size: they should be, the two together, of a capacity equal to one of the ordinary size; that is to say, if a 50-gallon cylinder were required for on ordinary cylinder apparatus, then with this dual system the reservoirs should not exceed 25 gallons each. Under these circumstances the cost of two reservoirs does not greatly exceed the one of an ordinary apparatus, and then we save nearly the whole length of the cold-supply pipe, which usually extends from top to bottom of house in the cylinder system, as just mentioned. The fitting up and fixing of two reservoirs of course exceeds that of one, but not very greatly.

In the illustration, Fig. 35, it will be seen that the primary flow and return between boiler and cylinder is carried in precisely the same manner as explained with the ordinary cylinder system. The same sized pipe would be used, the connections and the position of cylinder would be the same also. An emptying service would be needed below the cylinder, the same as in the cylinder apparatus, and as illustrated. All draw-off services must be taken from the secondary flow to insure the element of safety, that is, the feature of the cylinder system. Between the cylinder and the tank is carried a secondary flow and return. The flow starts from a flange affixed to the top of the cylinder, as usual, and

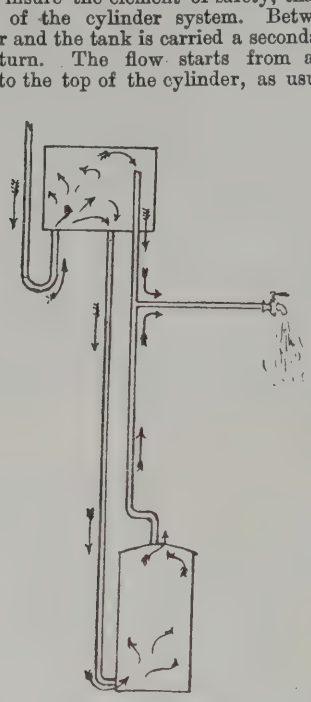

FIG.36

terminates at a high position in the tank, either through the bottom and standing up inside, or through the side, in the same way that a primary flow is connected into a tank. It is necessary that the pipe terminates within about 3in. or 4in. of the top of the tank, so as to be able to withdraw all the hot water without admixture with cold, as was fully explained with the tank system in Paper IV.

The secondary return is brought from the bottom of the tank down to the cylinder, but the point at which it should be connected there requires consideration. It must not be connected into the upper part of the cylinder, as has been recommended with the ordinary secondary return of a cylinder apparatus, for in this case the pipe will rarely contain hot water. It must be treated more as if it were a cold-supply service,

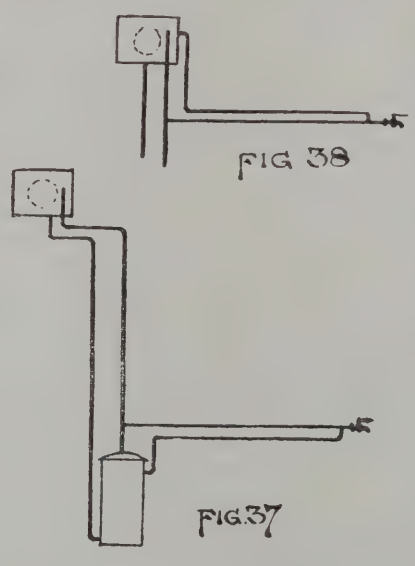

FIG 38

FIG.37

for it fulfils this office when a tap is opened as the arrows on Fig. 36 show, and therefore it is best to carry it in at a low point in the cylinder. The expansion pipe and the cold-supply service are both carried in precisely the same manner as with the tank system, and as illustrated.

If the positions at which the draw-off taps were required happened to be somewhat scattered, it would be necessary to carry the secondary flow in a direction that would come near to them, so as to avoid the necessity of long dra services. (The objections to long, single- draw-off services have been explained.) satisfactory returned draw-off service can effected with this apparatus in the usual any more than it can in the tank system, a or cold water would be drawn through the r portion of the service, as before explained. return was particularly needed to a dra service, the effective way would be to ca back into the upper part of the cylinder, as 37. By this arrangement the hottest water be drawn under any circumstances, the sa in the ordinary cylinder system connected this way. But this method of returning a off service would entail the use of an incon ent quantity of pipe if the tap was a dis above the cylinder.

If there were a tap up near the top o building, and nearer to the tank than the c der, it would be possible to return this dra service into the tank, if desirable and conve This would be done by making the dra service a branch of the secondary flow, minating in the tank at a point equal in hei the secondary flow itself, as Fig. 38. Whe water was circulating it would divide its this junction, some passing up to the tank b route and some by the other, and it would n not which pipe a tap was connected to hottest water would be drawn, so long a fitter used customary care in terminating branches at a sufficient height in the tank.

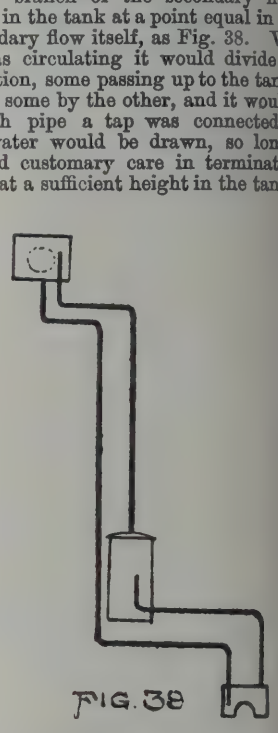

FIG.38

method could be adopted, in precisely the manner, in the ordinary tank system. Of co if only one tap existed up near the tank flow pipe could be diverted to supply it where two taps are upstairs at different p the method now recommended can be use adopted. It is not intended to sugge preference for this two-reservoir apparatus the ordinary cylinder or tank system, for ord purposes; but there are occasions commonly with that make this arrangement a po advantage, in which case no hesitation ne felt in utilising it.

It has to be mentioned that some engi advocate dispensing with the primary r entirely in an apparatus such as we are no cussing; in this instance continuing the secon return to the boiler without connection t cylinder, as Fig. 39. This, it will be seen, severs the cylinder from all return ser leaving it to all intents and purposes like a bulge or enlargement in the flow-pipe. Th an objection to this arrangement—not whe taps are closed and the water circulating n ally, but when a tap is opened. As just tioned, the secondary return of this appa fulfils the duty of a cold-supply pipe when is opened, and cold water passes down it ra to make good the loss so occasioned. Now this arrangement the cold water flows dir into the boiler, and as quickly makes its wa into the cylinder, as a matter of course. must be remembered that the flow-pipe termi a good distance up the cylinder, where the water is located—and this is necessarily a By the other method (Fig. 35) this result w eventually be attained in the same way; b would be much longer, and consequently w not bring about any reduction in the temper

ıe water issuing from the tap until the hot er was actually exhausted. It will bear re- ing that it is far from sufficient that the er in an apparatus heat up quickly. It must rranged that hot water can be withdrawn— hat there is of it, if desired—without admix- with cold. This is not such a simple thing commonly imagined, for it must not be for- en that the very instant a tap is opened, that e instant cold water flows into the apparatus ewhere; and if by any means this cold inflow find a direct route to the tap it will do so, aps without disturbing the hot water in the aratus at all. Commonly it is an admixture ot and cold water that is obtained. This is always objectionable; but at a scullery sink particularly so, as very hot water is always ded here; and it is also objectionable at early rning, when the hottest water is sometimes barely warm; and of course such a result is reverse of practical or workmanlike.

n the next paper the conversion of a tank paratus to the cylinder system will be treated. is is often required, but frequently thought to an expensive undertaking; such, however, is the case.

THE SOCIETY OF ARCHITECTS IN BELGIUM.—II.

HERE being no railway journey to follow in the evening, and the official programme taining but few items, Wednesday week spent Antwerp proved restful, while the buildings ked their best again in the bright sunshine, e during a brief thunderstorm in the after- n. There being an hour to spare after break- t before the first appointment, the members ttered, some visiting the church of St. Jaques, ose tower is bold in outline, and has some d detail, but which otherwise is poor com- ed with those of the churches seen in other ns. Those who visited the Bourse, a modern lding, had, however, a different tale to tell, its interior is rich in the extreme, with much ved ornament, two rows of traceried columns the ground floor, wrought out of a hard grey ne, being remarkable and pleasing, while the neral effect is much enhanced by the good top hting, though the wrought-iron roof is not ried in a very satisfactory manner, and would bably have looked better had less pains been en to ornament it.

At half-past ten one of the officials received e party at the Hotel de Ville, the exterior of ich, and of the old house commonly but roneously known as Charles V.'s Palace, had eady received considerable attention from those o had congregrated in the Grande Place—at at time a busy spot, being used as a fruit and getable market. The members were conducted m room to room slowly, so that each received e attention. In the council chamber, the prin- pal object of interest, from an architectural int of view, was the crisply-carved dwarf reen, said to have been executed by two isoners of the Inquisition in the 16th century; the conscript-room, it was an elegant but use- ss gallery, which possesses no means of access it, supported on Doric columns, having ham- ered brass casings to the bases and capitals, uch more effective and lasting than gilding ould be, and brass fretwork panels to the doors, ith a brass plate behind the fret; in the arriage-room, it was the elegant modern car- ng, while the non-architectural, the canvas all-paintings only just finished by Lagye, aimed and received universal attention and dmiration, representing first a Druidical mar- age, then a Roman one, then the first Christian edding, then that of Philip the Fair with Joan Castille, by which union Belgium came under ıe power of Spain, and lastly the first civil arriage, celebrated in 1796; in the reception- oom, it was the modern carving; and in the Mayor's private room, it was the fine 16th- entury chimneypiece, the delicate frieze to the ado of carved oak Renaissance fretwork, planted n a gilt ground, and, as a matter of practical nterest, a keyboard at the right hand of the Mayor's desk, each key communicating electric- lly with a bell, which would summon some par- cular functionary of the municipality.

Upon leaving the Hotel de Ville, a hurried isit was paid to the Plantin Museum, to which everal members returned for an hour after nch, for more careful study of the restful old ourtyard, which we illustrate to-day, and of the uaint detail of many a cabinet and chimney- piece and staircase newel, to say nothing of the unique wrought-iron pump spout. Two features noticed here, and in many other places, were the supporting of exposed joists and tie-teams by long flat corbels, often out of the same timber as the beam, and the supporting of the hearths of upper stories on a species of fan-vault.

At the Cathedral, M. Baeckelmans, the architect for the restoration, met the members and conducted them over this grand and well-known monument of Mediæval art; but, unfortunately, the work upon which he is now engaged received little but censure from the members, for he has just blocked up the west window to accommodate an organ-loft, and has carried this upon a wrought-iron framing attached to the old stone piers, and with a bold stone base, which would have looked magnificent had it been carried up to do its proper duty, which it would be well able to fulfil, while now the at-present unsightly stanchions are to be cased with carved oak panelling. However, it is not fair, without knowing local circumstances, to criticise too severely, and some of the recently-executed external restoration is sufficiently good to warrant M. Baeckelman's reputation. It is not necessary to dwell upon the well-known lantern, or the pictures, but a word of very hearty praise is due to M. de Bolck for the exquisitely delicate tracery

Wrought-iron Water-spout to Pump, Musée Plantin, Antwerp.

of the new reredos just erected in the first chapel eastward from the crossing in the first northern aisle, as also for the carved figures which adorn it. It is a work of most exceptional beauty. The work of the day concluded with a scramble over the flat stone roof to the aisles, and the immensely, almost unnecessarily, solid timber roof over the vast nave.

Malines, or Mechlin as it is often called, which was visited on Thursday, is a little town well known to the artist and the architect, but not to the general traveller, who passes by its quaint and quiet beauty in his hurry to reach Brussels and the German frontier. Were he to visit it much, however, its great charm of quietude would be lost; but yet the overpowering mass of the great tower, as it suddenly appears in view on turning into the Place after the long walk from the station, would yet even appeal to him, the guidebook-ridden Briton, as something masterly and wonderful, as it made the members pause before proceeding onward. At the entrance to the cathedral they were met by Canon von Caster, acting as deputy of the Cardinal Archbishop, a man of courteous mien and noble presence, and a great archæological enthusiast. He gave dates to the various portions of the building (nave 1280, crossing 14th century, choir early 15th, and chapels and tower of the 16th), and pointed out many things which else would have escaped notice, particularly the fact that the carving of most of the capitals had been destroyed and had been replaced by plaster casts. It was very noticeable that both the carving and the nave caps, even in those which had been left in their original state, and also that in the masterful little spandrels to the north transept arcade, were of a naturalesque and flowing character, in spite of their early date. The great tower, which the members ascended, he showed to be supported almost entirely upon the two flanking walls, while he said that the foundations, resting on hard, fine gravel, were but 3½ mètres deep below the ground, and projected only some 15in. on either side. At its base, the extreme width of the tower from outside to outside of the buttresses is 75 mètres, while the height of the finished portion is 97 mètres. The canon's grandfather, after careful study of old documents, had got out a design for its completion, which he showed the members in his private room, which, if carried out, would have added another 70 mètres, and most beautiful the projected spire certainly would be. At lunch, of which he partook with the members in the best hotel in the town—which could accommodate so many with the utmost difficulty, but did it with an evident desire to please, with rapid serving, though there were but two girls to wait on forty-two hungry men—at lunch the canon expressed a desire to be admitted as an honorary member into the Society, and afterwards he led a slightly reduced following, less by those who wished to sketch, round about the town, first to the well-grouped Convent des Carolites, which we illustrated last week, and which looks in reality even more picturesque, with the canal in front of it, than the illustration shows; and then to the Hôtel Basleyden, with another quaint tourelle and open balcony, and a quiet, well designed courtyard, with grapes and creepers growing over the building, now none other than the "Mont de Piété" or Government pawnshop. A moment's glance was bestowed upon the Renaissance College of St. Rumbolt, which there has been a movement to restore, hitherto resisted successfully by Canon Von Caster, and then a somewhat longer period to the restored, and generally faithfully restored, palace of Margaret of Austria, in the courtyard to which can be seen a curious column with Renaissance cap and base, having an attached shaft, cut out of the same stone, of Gothic proportions and with Gothic mouldings. The Maison du Grand Conseil at the corner of the Place, scarcely received the attention which it merits; nor did the Halle aux Draps, whose architect had been sent to Bruges to study the detail there before designing it. More time was spent in the museum, waiting for copies of some books which the canon had presented to the members, and then, in the walk up to the station, several old houses were seen, among them being the Fisher's House, Salm Inn, the earliest Renaissance building in Belgium, the 13th century bridge close to it, and the church of Notre Dame of little note architecturally, but containing Rubens' picture of the "Draught of Fishes," concluding with a view of the old gate to the town. At the station the members said farewell to their most courteous guide with deep regret, but with the knowledge that he would remain in correspondence with the society.

Friday was devoted to a short trip from Brussels to Louvain, and, in spite of intermittent rain and drizzle (it never really cleared until the evening), proved as full of interest as anything yet undertaken, while the reception met with left nothing to be wished for more. M. Goyers, the famous wood-carver of Louvain, met the members at the station, and led them to the cathedral, an exceptional sight being witnessed on the way in the military funeral of an ex-Prime Minister of Belgium, and it may be mentioned, as an aside, that the guards who formed the escort are as fine a body of troops as anyone would wish to see. Fortunately the main interest of the cathedral lies in the interior, for the outside, though picturesque in grouping, has been much shattered in revolt and war; and even within it is not the edifice itself which claims attention, but the well-preserved fittings there, particularly some most extraordinary ironwork in the hinges, key-plates, and ventilating panels to some cupboard doors in the chapels to the southern aisle. At twelve o'clock, however, before much had been inspected, the members were turned out, and proceeded then to inspect M. Goyers' workshops. There the whole process of wood-carving—wood sculpture of the highest order would be a better name for it—was to be seen; first the sketch, then the small-scale models, then the careful, full-sized clay-model, and then the hewing out and finishing; every figure being instinct with ease and life, and every face of exquisite expression. There also was the white marble chimney-piece, of a beautiful type of French Renaissance, which took the Grand Prix at the Paris Exhibition in 1889; and also, truth sorrowfully to say, much cheap and inferior Gothic work, with details planted on which should be worked from the solid, single orders of shallow chamfers where there should be rich mouldings, and carved

foliage with all the life and beauty lost. No wonder then at the boast that Gothic work could be produced 30 per cent. more cheaply than in England. Even the figures, exquisite as they were in form, showed the mercantile spirit which prevailed when examined closely, for the drapery is all arranged in simple and long, flowing lines, the hands and feet being hidden as much as possible, and all expensive detail carefully avoided.

In the afternoon the senior échevin, M. Fonson; the city secretary, M. Marguery; the archivist, M. Van Even; and the architect, M. Fissche, received the party at the Hôtel de Ville, an excellent glass of champagne—not the first partaken of that day—being handed round. Then the upper hall, with its wood pendent ceiling and rich new chimney-piece, about to be coloured, and some fine new paintings, received their share of merited attention; but the exterior of the building, lovely as it is, was scarcely noticed, owing to the rain. Instead of studying it, the members went on to St. Gertrude, and were well repaid for their trouble by seeing the finest wood-carving in the country—the choir stalls, of richest Gothic detail, just of the time when the Flemish Renaissance was beginning to be felt. Fortunately, by this time the rain had left off, and a splendid bit of quiet colour was witnessed looking down a narrow street from the Halle aux Draps to the Hôtel de Ville and the cathedral. The Halle itself boasts of a magnificent hall, with the floor above supported by a row of massive columns carrying semicircular arches; while the exterior, a somewhat confused mixture of Gothic and Renaissance, having been much altered in the 16th century, boasts of a unique 14th-century arcade with triangular-pointed arches. Further on a brief visit was paid to a richly-traceried brick-fronted house (14th century), and then the visit terminated. The sketching fever, which had taken time to develop, had by Friday fairly set in, and all accessible details of value were jotted down by one member or other of the numerous party.

Saturday, though spent in Brussels, was rather a day of recreation than of architectural interest, for circumstances had caused the proposed visit to the Cathedral of St. Gudule to be cut out of the programme, and the Hôtel de Ville is decidedly lacking when compared with that of Louvain, though the echevins (Messrs. Becquet and André), the archivist (M. Wanters), and the architect (M. Jamar) showed the members every kindness, and threw open to their inspection many rooms not seen by the general public. The principal points noted were the arrangement of the electric lights, sometimes around the cornices, sometimes grouped together in well-designed electroliers, and the exquisite carving of the dado in the office of the Director of Public Works—most of it original, and the rest designed in consonance. In most cases the modern restoration and decoration, supervised by M. Jamar, were excellent, both in design and colouring; but in one room at least the effect was spoilt by the introduction of too much gilt on the electroliers.

No time, unfortunately, could be devoted to the work now proceeding at the Communal Museum, opposite the Hôtel de Ville, which appeared, at a hasty glance, to be in thorough harmony with the rest of this fine and well-known building, for already the party was overdue at the Palace. There most exceptional facilities were given for everything to be seen, it even being particularly requested that members might keep on their hats within the building. The staircase and the ballroom at least are worthy of the extravagant praise bestowed upon them, for they are of mighty proportions, and excellently designed; but they are lacking in colour, for they have never been decorated, and lack the elegance of detail seen the previous day. It was restful, though, to wander through the lofty rooms, and to inspect the marvellously-beautiful furniture and fine Dresden porcelain, which was all, by special order, uncovered for inspection. It was the universal opinion, however, that the sanitary arrangements want immediate attention, for everything is as bad as most similar arrangements in Belgium, and that is as bad as can be. Our Heir-Apparent nearly lost his life once from sanitary defects in an English palace. We do not wish him to suffer again in the same way when on a visit to a friendly sovereign.

In the afternoon a most enjoyable time was spent in inspecting the foundations of the new church to be attached to the Palace at Laeken, which is to be of iron and glass, octagonal, with a conservatory completely round it; the present conservatories and winter garden, and the work proceeding at the Palace, now being rebuilt, for it was destroyed by fire on January 1, 1890. While noting for future use the truthful way in which the ironwork of the glass-houses had been ornamented, the members equally noticed, for future avoidance, the large amount of stucco employed everywhere on a rough brick backing, having a good appearance now at little cost, and so well executed as to be detected as a sham with difficulty, but a sham all the same, and one which will not stand the test of time. The local system of working the mouldings of stonework *in situ* was also noticed, as was also the main cornice of the building, now being put in in wood instead of stone—a curious exception to the general rule to make the new palace fireproof. Mr. Knight, a Scotchman, had acted as guide so far, and then placed the members in charge of the gardener to conduct them through the park; but half a dozen got separated from the rest, and presently stumbled upon a guard of soldiery, who politely conducted them back to where they started from, and, equally politely, intimated that they would be shot down if found wandering there after eight o'clock. By that time, however, they were comfortably seated at dinner at the Hôtel de l'Empereur; and after dinner, as some fifteen of the party were returning home on Monday, several toasts were drunk, the principal being to His Majesty the King of the Belgians, who had behaved with such remarkable graciousness and condescension to them, the ecclesiastical and municipal authorities, who had opened the buildings in their charge to their inspection, and their brother architects in Belgium—men who had shown them great kindness, and whose works would be highly appreciated in the future by all who had now inspected them.

On Monday morning the party divided into two, the smaller number returning to England, being unable to remain a second week, while the majority proceeded to Mons. There they were received by M. Joseph Hubert, the architect of the cathedral and honorary architect of the town, and M. Dosveld, the actual director of works of the municipality. The first point visited was the cathedral, a fine pile erected between 1450 and 1589, entirely according to the original Flamboyant design, save that the tower has never been completed. Much of the tracery is good and unobtrusive, while the internal effect of the lofty nave is excellent with its brick, vaulted roof, the ribs of which are carried right down to the pier bases, there being no caps to the piers or other interruption. In the 16th century a fine Renaissance screen in white marble was inserted in the nave, an engraving of which was seen, but now only a few of the sculptured alabaster panels by Dubiaencq, with which it was adorned, remain, and these are scattered about in various places, most of them forming portions of the high altar and chapel altars, all excellent in composition, though the figures are attenuated. The authorities kindly exhibited their treasures also for inspection, and these included a small cross of the 8th century and a beautiful little 13th-century reliquary of filigree gold and inlaid silver ornament characteristic of the period, exquisitely wrought, while a little illuminated Book of Hours also excited admiration for its well-preserved and beautiful ornament and lettering. A visit to the quaint belfry, with its spire supported and surrounded by small bulbous domes, shingle covered, and, after lunch, to the Hôtel de Ville, with its bold and well-detailed 15th-century front, completed the day in architectural interest, for a considerable walk afterwards only revealed the meanness of the modern work in Hospital and Normal School.

The grandest building seen during the whole tour was the cathedral at Tournai, viewed on Tuesday. Probably it would not appeal so greatly to the ordinary visitor as would the richer cathedrals of other towns; but to the architect it is rich in suggestion, and impressive in the highest sense. Canon Huguet received the visitors on behalf of the Bishop, who was absent from Tournai, exhibiting first the many valuable and beautiful treasures belonging to the cathedral, rarely shown to visitors—wonderful specimens of the goldsmith's art, particularly a unique gold cross, and a cross-shaped reliquary in true Byzantine style, enriched with pearls and precious stones. A chasuble of silk, once worn by Thomas à Beckett when visiting the town, and other richly-worked vest were displayed, of gold thread patterns w on deep crimson velvet. Then the Canon attention to two shrines in silver gilt, and wards traced the history of the cathedral. Romanesque nave is unique in its simplicit grandeur, commenced in the year 1070, varied and richly sculptured capitals, looki if they had been carved but yesterday Canon invited the members to inspec piers of the nave and double aisles, a mos usual feature being the octagonal nook s Then came the crossing and the apsidal septs, with their single narrow aisles, successful and most unique in treatmen which it is best to attempt no descriptio they must be seen to be appreciated, leadin the eye most naturally to the lofty cho mètres from floor to vault, of the fully deve Gothic of the 13th century, standing out i hard grey stone in contrast to the whitened and with a retro-choir of slightly later French in character, with shallow bays to a of much stained glass being introduced. unusual feature, too, is the thickening of main piers to the choir, to strengthen them they began to fail, in the early portion of 14th century, most successfully accomplis and scarcely noticeable, in spite of the aisle v ing being thus thrown out of centre. Exter the cathedral, though noble in mass, fails i grouping, the central spire not rising abov four large flanking spires, but the trefoil he north and south doorways, richly sculpt with figure subjects, are worth notice.

Beside the cathedral, a house in the Ru Paris should be seen, with similar tracery o face to that seen at Bruges, but in stone ins of brickwork; while the pure 13th century ch of St. Jaques is remarkable from the trifo gallery being without the clerestory wind and that of the Madeline is of the simple beautiful type of a country church of the period. The old town gate across the r with portcullis groove and battlements, to b it against intruders, is interesting in its ra Thus the day spent at Tournai was a most en able one, though there had been little on programme.

PLASTERERS' WORK.

THE Worshipful Company of Plaiste having offered the sum of £25 as prize proficiency and skill in plasterers' work, the and Guilds of London Institute is prepare hold an examination in plasterers' work and a crafts, and to award certificates and medals on results of such examination.

The examination will be in two gra Ordinary and Honours.

The Ordinary Grade Examination will co of a paper of questions only. The Honours be both written and practical.

The prizes to be awarded on the result the examination, provided the candidates s sufficient merit, are as follows:—

Honours Grade.—1st prize (Plaisterers' C pany's prize), £8 and Institute's silver me 2nd prize (Plaisterers' Company's prize), £7 Institute's bronze medal; 3rd prize (Plaister Company's prize), £5 and Institute's br medal.

Ordinary Grade.—1st prize (Plaisterers' C pany's prize), £2 and Institute's silver me 2nd prize (Plaisterers' Company's prize), £2 Institute's bronze medal; 3rd prize (Plaister Company's prize), £2 and Institute's bronze me

The examinations will be held in acc ance generally with the rules and regulations the technological examinations of the Institut contained in the programme.

I. Syllabus.—The examination in the dinary Grade will include questions founded the following subjects:—

1. *Limes.*—Names and qualities of var limes used in candidate's neighbourhood. tinction between hydraulic and non-hydra lime. Methods of slaking for various lim Purposes for which each variety is best fit Time of slaking before using.

2. *Sand.*—Various qualities of. Proportio admixture for various limes and purposes. S stitutes for sand.

3. *Hair.*—Use of, and substitutes for.

4. *Stucco.*—Mixing and tempering for ordi and rough stucco, for rough casting, bastard trowelled stucco, for fine stuff, run putty, gauged stuff. Composition and use of each.

Plaster of Paris.—Mineralogical character, nce obtained, and how prepared. Its use n used pure, its influence on lime stucco by ixture. Preparation of moulds for casting n in plaster, wax, sulphur, and gelatine. ing, cleaning up and fixing, running and ing cornices. Canvas plaster, its prepara- s and use.

Lathing.—Size and qualities of laths, sub- ites for laths for fireproof construction or erwise. Preparations of new walls, brick or ie, and of old and discoloured walls.

Cements.—Natural and artificial. Character ements for external and internal use. Mode gauging and using Roman, Portland, Keene's, ian, Mastic, Selenetic, and other locally used ents. Polishing internal work, staining or ing.

Tools used in plasterers' work and allied fts.

Candidates for the Honours Grade will be re- red to pass a written examination and to pro- e examples of their practical work.

(1) Written Examination.—The written ex- ination may include more difficult questions the subjects of the Ordinary Grade Examina- n, and, in addition, a knowledge will be uired of:—

Plastering.—Causes of hydraulicity of certain es, and how hydraulicity may be imparted to es not possessing it. Test of quality for limes cements (excluding tenacity). Quantities of terial required for covering a given area. ting out ceilings for applied ornaments. Running a moulded oval, having its major s one-third greater than its minor. Plastering umns with an entasis on brick core, or studded l lathed core, mitring cove 5ft. deep octagonal plan.

'Sgraffito Work.—Description of. Prepara- n of coloured ground work. Pigments required coloured grounds generally, and for external rk. Methods to be employed for skimming t in small and large works. Pouncing, ting up, and clearing out. Process with lti-coloured groundwork.

Modelling in Stucco.—Material required for undwork; for finishing coat. Description of served examples of modelled work, internal or ernal, in candidate's neighbourhood or else- ere.

Other Processes, &c.—Preparations and pro- ses for indurating plaster of Paris. Piece ulding from high relief and from the round. sso-work. Scagliola: how prepared and ished. Gilders' composition or "compo." rton pierre and analogous compositions in which ster is used for inferior decoration.

(2) Practical Work.—The candidate will o be required to execute during the year pre- ding the examination, and to forward the same London (carriage paid) a week prior to the amination, an original specimen of his work, hich shall not exceed 3ft. by 3ft. by 1ft. in mensions.

The specimen may be an example of:—

1. 'Sgraffito work.
2. Modelled stucco.
3. Piece moulding with cast from same not eaned off.

Drawings by candidates of old ornamental rk in stucco, with name of place where found, ay be forwarded with specimens of practical rk, and will be considered in the award of izes.

III. Full Technological Certificate.—A ovisional certificate will be granted on the sults of the above examination. For the full chnological Certificate in the Ordinary Grade, ndidates will be required to have passed the cond Grade Examination of the Science and rt Department in Freehand and Model Draw- g; and for the full certificate in the Honours rade, they will be required to have also passed elementary modelling.

III. Works of Reference. — Rivington's Notes on Building Construction," Parts II. d III. (Longmans); G. R. Burnell's "Limes, ements, and Mortars" (Weale's Rudimentary ries, Crosby Lockwood and Son, 1887); W. ichaelis' "Die Hydraulische Mörtal" (Leipzig, 69); "Portland Cement," H. Reid (Spon).

The first examination will be held on the ening of Wednesday, May 4, 1892, provided a fficient number of candidates present them- lves. Candidates should send in their applica- ons on or before March 26, 1892, to the nearest local secretary, who will forward them to the Offices of Examinations Department of the Institute, Exhibition-road, London, S.W.

THE LONDON CARPENTERS' STRIKE.

THE London Master Builders' Association have refused the offer by the Board of Conciliation of the London Chamber of Commerce to arrange another conference between the Association and the United Trades Committee of Carpenters and Joiners. Mr. Henshaw, the secretary of the Association, in his letter to the Chamber of Commerce, says:—"Having already had three conferences with the men the committee cannot see that any good would result from another meeting. My committee made offers of certain concessions which, as they were not accepted (but were met by the aggressive step of striking more firms), were subsequently withdrawn. I am further instructed to point out that this strike was forced on by a minority of the men, and the whole of the summer months having been wasted at a great loss, the employers feel it more than ever necessary to resist the unreasonable demands put forward." Five additional firms, however, have this week conceded the full terms of the memorial, making 55 in all. During the present week the United Trades Committee have received about £400, including the following sums from other trades:—A second donation of £70 from the London Society of Compositors (making £100 in all), £50 from the Railway Servants' Union, £25 from the Amalgamated Tailors, £20 from the Bricklayers' Union, ten guineas from the Glass Blowers, £10 from the Coachmakers' Society, £7 10s. from the West End French Polishers, and £5 from the Bakers' Union. The amount paid all round for the past fortnight has been 9s. per head per week, and the same will be paid again on Friday. At the London County Sessions, on Monday, Thomas Young and Richard Arscott, carpenters, who were convicted at the last Sessions of "besetting" the foreman to Mr. Bridgman, of Brownlow's-mews, builder, were brought up for judgment. Sir P. H. Edlin ordered them to enter into their own recognisances of £20, and to find two sureties of £10 each to come up when called upon.

CHIPS.

A Volunteer drill-hall is about to be built at Bridgend, from plans by Mr. P. J. Thomas, of that town. It will be castellated in character, will be faced with local stone, and Bath stone for dressings, and will provide a clear space for drills of 60ft. by 45ft.

A new police-station is about to be built in Gayfield-square, Edinburgh, from plans by Mr. Morham, city superintendent of works. The building will be Classic in character, and will cost £2,500.

A handsome new chapel, dedicated to St. Francis, has been erected over the vault containing the remains of the late Sir Francis Turville, V.C., by his widow, the Baroness Lisgar, in St. Mary's Church, Bosworth, Hull. A tomb with a recumbent figure of Sir Francis is placed in the rear of the chapel facing the altar. The chapel is furnished with stained-glass subjects in the tracery windows, some by Messrs. Hardman, of Birmingham, and the others by Messrs. Mills, of London. The style of the chapel is Early Decorated, and in keeping with the church, which was also designed by Mr. A. E. Purdie.

At the Barnstaple Bankruptcy Court, on Friday, Robert Taylor Hookway, builder, of Bideford, was further examined in reference to his dealings with a bank, and the case was then adjourned until the October Court.

In the case of the application of Edmund James Gorham, of Sevenoaks, builder, for a discharge in bankruptcy, the order has been suspended by the Registrar for six months.

A Wesleyan chapel at Eastgate, near Stanhope in Weardale, was opened last week. Mr. J. W. Taylor, of Newcastle-on-Tyne, whose designs were selected in competition, is the architect, and Mr. George Race, of Westgate, is the contractor. The chapel will be Early English in style, will measure internally 40ft. by 25ft., and will be built of Toru Law stone, with Dunhouse stone dressings. Accommodation is provided for 150 persons.

Two brothers named Wallwork, cabinet makers, living in Upper Jackson-street, Hulme, Manchester, returned home on Sunday night drunk, and the younger, Harry, stabbed his brother to the heart with a chisel, causing instant death. He has been committed for trial on a charge of murder.

Building Intelligence.

Bodmin.—The memorial-stone of the new Public Rooms at Bodmin will be laid by Lord Robartes on Monday next. The new buildings are rapidly rising into prominence on Mount Folly-square. The design was obtained in competition among the architects of Devon and Cornwall, and Mr. Octavius Ralling and Mr. Lewis Tonar, of Exeter, were jointly the authors of the selected design. On tenders being invited, that of Mr. Sampson Trehane, of Liskeard, was accepted, and he is now carrying out the work; the building costing just over £3,000. The accommodation is obtained on basement, ground, and first floor. In the basement are a drill hall, 40ft. by 26ft., a kitchen, stores, furnace-chamber, and rooms to be let as office or business premises. On the ground floor is the main hall, 80ft. by 40ft. On the first floor is a small hall occupying the space over the vestibule and cloak-rooms, being 35ft. by 20ft., which may be used either separately or in conjunction with the main hall. The main body of the work will be of local stone dressings of Hamhill stone, and Luxulyan granite for the base. Internally the work will be of pitch-pine varnished. The feature of the Mount Folly elevation is a gable, having the founder of Bodmin (King Athelstan) carved in a circular-cusped and foliated panel, as represented on the seal of Bodmin.

New Opera House, Southport.—This building, which is now practically complete, was opened on Monday, the 10th inst., the contractors being Messrs. R. Neill and Sons, of Manchester, and the cost of same, exclusive of site, about £20,000. Mr. Frank Matcham, of London, is the architect. The elevation to Lord-street is of mixed Flemish design, with Moorish octagonal turrets surmounted by domes and finials, made by Fambrini and Daniels, of Lincoln, in their imperishable red concrete masonry. The façade is of red brick, artistically relieved with modelled art panels, emblematic of music, poetry, art, and drama. These, together with the moulded cornices, stringcourses, animal grotesque corbels, scroll work to gables, &c., are of Fambrini and Daniels imperishable red concrete. The turrets act as ventilators to various parts of the building. The whole of the screen and portraits, together with the other art productions and dressings of the building, have been modelled and produced in imperishable red concrete masonry by Messrs. Fambrini and Daniels, of Excelsior Works, Lincoln.

Sligo.—A branch of the Bank of Ireland was opened last week in Stephen-street. It is in the Italian style, from the design of Messrs. Miller and Symes, Dublin. It was built by Mr. Clarence, of Ballisodare, at a cost of about £6,000. The exterior walling is chiselled in Ballisodare limestone in coursed and jointed ashlar, with rock-faced basement. It is three stories in height. The ground-floor is devoted to the business department, and the upper portion is the residence of the agent. The street façade is severe in style. The doors and window-dressings, as well as the strings, cornices, &c., are of Mountcharles grit. In the public office the walls and ceiling are treated with dentilled cornices and floriated modillions. The office-fittings, counter, desks, &c., were executed by Mr. Clarence.

Sir Arthur Blomfield, A.R.A., has undertaken to visit Swansea for the purpose of making an inspection of St. Mary's parish church, with a view to furnishing a report to the vicar as to the practibility of restoring the fabric, or the erection of a new cathedral church on the present site.

The ceremony of unveiling the statue of the late Mr. James White, of Overtoun, a well-known Glasgow merchant, was performed on Monday by Sir James King. The statue has been erected on the site of the Old Barony church in Cathedral-square, Glasgow, and is the last work of the late John Mossman, of that city.

Mr. W. L. Micks, Local Government Inspector, held an inquiry on Wednesday week under the Irish Labourers Acts at the workhouse, Dundalk, into the scheme proposed by the board of guardians for the erection of 21 cottages in the electoral divisions of Carlingford, Castletown, Darver, and Rathcor. The formal evidence as to the compliance with preliminaries was given by Mr. Cahill, the architect to the board of guardians.

ARCHÆOLOGICAL.

Roman Villa at Twyford.—The members of the Hampshire Field Club arranged a supplementary excursion on Thursday, the 20th inst., to view the remains of the Roman villa which has been discovered on land on the east side of the picturesque village of Twyford, and to which allusion was made in our issue of a fortnight since, p. 240. The party included Mr. Stevenson, the director of explorations at Silchester, Mr. T. W. Shore, and Mr. William Dale, the hon. organising and general secretaries, being the conductors for the day. Mr. Shenton, the owner of the site, has arranged close by a museum containing many interesting things found in connection with this villa, including large flints and taps used in construction, nails, and other implements in iron, and bronze hooks, flanged bricks, and oyster shells. The find of coins is at present limited to two small brasses, not in a good state of preservation. One is a Claudius II. (268-70), and the other a Valentinian I. (364-75).

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Public Sanitary Inspectors' Association.—The annual summer meeting of this asssociation took place on Wednesday at Hastings. Mr. Hugh Alexander, chairman of the association, gave an address in which he referred to the origin of the association, its objects, and progress. Its objects were to obtain for sanitary inspectors a legal status, to make their appointments permanent, and, among other things, to amend the law in several matters in the interest of the public health. Referring to recent legislation, he said the Government proposal to give to sanitary inspectors that lease of office which was their just due had unfortunately not received Parliamentary sanction. The words "sanitary inspectors" were omitted from the Act, although like privileges were bestowed upon medical officers of health. Dr. A. Scardyn Wilson, Medical Officer of Health for Hastings, then gave an address on "The Sanitary Advantages of Hastings." A cordial vote of thanks was given to Dr. Wilson for his paper, moved by Mr. E. Tidman, M.S.A., and seconded by Dr. Tripe. Dr. G. Reid, president of the Staffordshire branch, proposed a resolution in favour of a more secure tenure of office for sanitary inspectors being provided in the Public Health (London) Bill. A visit was afterwards paid to the sewage precipitation works at Bo-peep, the waterworks, the St. Leonard's Gardens, and the refuse destructor.

CHIPS.

Messrs. Holme and Green, contractors, Liverpool, have given their undertaking that the Grand Pavilion now being erected at the shore end of the pier at Rhyl will be ready for opening on Saturday, Sept. 12. The Pavilion is the largest on the North Wales coast, having seating accommodation for 2,842 persons, besides the stage, which will seat 250. Messrs. Bishop and Sons, London, are now erecting the grand organ of the Manchester Jubilee Exhibition of 1887 within the pavilion.

Alterations have been made to the Vestry-hall, Battersea Rise, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by Messrs. Robert Boyle and Son's latest improved patent self-acting air-pump ventilators, and fresh air admitted by their improved air-inlets.

Messrs. W. H. Lindsay, Neal, and Co., have removed their offices from South Wharf to 15, North Wharf, Paddington, W., adjoining their girder works.

The members of the Junior Engineers' Society visited Darlington on Friday, where the leading works were placed at their service for inspection.

Mr. John Murdoch, C.E., Ayr, has been appointed to carry out the work of building a new inner wall in South Harbour-street, Ayr. The wall will extend from the New Bridge to a point opposite the Queen's Hotel.

A serious accident, involving the death of one man and injuries to another, occurred on Wednesday afternoon in Middlesex-street, Aldgate, better known as Petticoat-lane. Some building operations are in progress at the rear of Garden-place, and a wall at the corner of that thoroughfare and Middlesex-street collapsed, being forced apparently forward by the further excavations of earth deposited against it. Andrian Sanson, of Finchley, was greatly injured, and Judah Cohen was killed.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., LVII. LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

NO REFRESHMENT NEEDED BY THE A.A.

To the Editor of the Building News.

Sir,—I am sure that all members who joined the Architectural Association this year would be sorry if some remarks in the admirable account which you published last Friday of our wanderings in Shropshire should be misunderstood as expressing any discontent on our part with the reception we met with at the various houses visited.

Our gratitude, on the contrary, is due to those generous owners who not merely tolerated with patience and good humour a party of thirty strangers rambling over their houses at will, but in more than one instance welcomed us as friends, and accepted the infliction as a compliment.

The hero of the lettuces in particular showed himself especially desirous to do all he could for us, and the slip of producing them unwashed was evidently due to aberration of mind, consequent upon over-anxiety to be hospitable under the difficult circumstance of having only just moved into the house with a few impedimenta to prepare it for his family.

It is true that on rare occasions in previous years the members of the excursion have been entertained at luncheon or tea by the owners of places visited; but—and it may be said without ingratitude to those hospitable people—such entertainment is never expected or wished for.

I shall be much obliged by your finding room for this letter in your next number.—I am, &c.,

Frank Baggallay.

ARCHITECTURE: A PROFESSION OR AN ART?

Sir,—University Freshmen, and even University Dons, for they need not necessarily be excluded, imbibe, through a truly devious cou of training in logic, the vicious mental habit substituting verbal casuistry and paradox for plain paths of truth, which in treatises on lo would be formally termed specific cognitio The question above, if question it be, fai examples the point at issue. Of the quest itself, in the form it stands, I could never ma head or tail, nor, I should think, anybody e It played a lively little game in the columns the *Times*, hare-and-hounds like, and, so far a am aware, nobody was the wiser for it. At a rate, it certainly proved the statements form lated above. The question—for a question certainly is, and a serious one—will find it fully answered in the four following propositio which I will formulate by way of a rescript:-

1. Architecture is a profession.
2. Architecture is an art.
3. Architecture is an artistic profession.
4. Architecture is a professional art.

Which, I think you will admit, fully cov the ground.—I am, &c.,

Chas. R. Guy Hall

13, St. Alban's-road, Kensington, W.

Intercommunication.

QUESTIONS.

[10607.]—**Velocity in Circular Pipes.**—Be Denton gives the following formula for finding velocity in circular pipes:—

$$V = 55\sqrt{R \times 2H}$$

when V = velocity
R = hydraulic mean depth
$= \frac{1}{4}$ dia. in circular
H = fall in feet per mile.

Using this formula, how does the different velocity the degree of fulness of the pipe appear?—Velocity.

[10608.]—**Heating Houses.**—What is the system of heating private houses? I am recommer what is called the high-pressure system which is scribed as a continuous coil of pipes 1in. diameter, w forms the boiler, and is continued in any requ direction returning to the fire without any escape w ever, a vertical pipe being fixed above any of the c pipes fitted with a screw plug in which the wate poured as required. Is not this a dangerous sys liable to explode at any time? What becomes of expansion when the water is turned into steam?—Hea

[10609.]—**Warehouse Floor.**—Will any of readers kindly inform me as to the simplest manne trussing an old country warehouse floor to prevent sagg The area covered is 70ft. by 29ft. 6in., and the wood be are 12in. by 10in., and about 3ft. 6in. centres. A bea the centre running the whole length, supported columns, would be in the way. It is intended to let existing beams remain.—Support.

[10610.]—**Furnace-Room.**—Subscriber would glad to know the best way of economically constructi furnace-room, the floor of which will be 6ft. 6in. b level of ground. The water level on site is about below ground level, and as there is no possible wa draining the ground, the walls and floors must of nece be made waterproof.—An Old Subscriber.

[10611.]—**San. Inst. Exam.**—I wish to work u Sanitary Inst. Exam., and should be much oblige anyone who has passed would inform me what book obtain, and cost of same?—Student.

[10612.]—**Sewers.**—Are local authorities under obligation to provide sewers of sufficient depth accommodate drains from ordinary basement level Westminster.

[10613.]—**Italian Renaissance.**—Would reader advise a country student as to the best book Italian Renaissance architecture?—Palladio, jun.

[10614.]—**Sewage Drain.**—Will friends kindly their opinion on the following points:—1. Is it pos to give a sewage drain too much fall? A short time I was told of a drain that, altered to a less fall, ca sand away better, the supposition being that with greater fall the water passed away too rapidly and lef sand behind. 2. As a question of expense is it absol necessary to provide a ventilating shaft for drain on pool side of disconnecting trap to w.c.? The lead soil would be continued full size to the roof. The connection and inspection chamber, with full-size inlet, would be about 15ft. from foot of soil-pipe. position being the best for the possible future conne of a closet on the ground floor, would there be danger of the drain gas passing the disconnecting and if it did, would it not pass away through the soil without doing much harm? With the minimum drain-pipe consistent with efficiency and a three-g flush of water, would not the air in drain be cha pretty well every time the closet was flushed? A inlet could be fixed to cesspool end, and if neces another disconnecting trap close to cesspool. The would be about 60 or 70 yards long.—J. H.

REPLIES.

[10604.]—**Weights and Measures.**—Send p order for 2s. to Eyre and Spottiswoode, Fleet-street, for: 1, Weights and Measures Act, 1889, 2, Examination of Inspectors, Notice to Candidates, Heads of Examination, 2d; 3, Model Regulations regard to Inspectors and Inspection, 1s. 6d.—R. Wat

LEGAL INTELLIGENCE.

Claim for Extras.—At the Sussex Assizes on the 13th inst., an action was brought by Charles Hill, builder, of Gerard-street, Brighton, against George Stephens, of Ditchling Rise, Brighton, to recover £274 8s. 2d. for work done and materials supplied. The defendant put in a counter claim for £200. The amount claimed was the balance of an account for work done and materials supplied in building two houses. The defence was that the houses were to be built for £300, and that the plaintiff's charges were excessive. The defendant also alleged that the houses were not built in a workmanlike manner, and were not fit for habitation. For this he claimed £200. Plaintiff stated that he built two houses at defendant's request. After the work had been started the plans were altered, and he did extra work for the defendant. The work he executed cost considerably more than £300. There was no contract. Mr. Parnacott, surveyor, and Mr. George Holloway, builder, stated that it was impossible to build the houses for £300. Defendant said he showed plaintiff a plan, and asked him if he could build the houses for £300, and he said he could and would do the work to his entire satisfaction. The jury found that there was no contract, and judgment was given for plaintiff. The question of value then arose, and it was decided to refer it to arbitration, together with the claim by the defendant, the arbitrator being Mr. Murphy.

Workman's Claim for Loss of Time.—Mr. Wemberg, of Motley-street, Haggerston, cabinet maker, was summoned at Worship-street Police Court last week by Edward Wood, of Ponderson's-gardens, for the sum of 11s. 4d., wages claimed to be due. Mr. Thompson appeared for complainant, on behalf of the Cabinet Makers' Union, and stated that his client contracted to make a cabinet for £3 17s. 6d., the defendant to supply all the materials. The complainant's case was that he had been kept standing for materials, and had lost 17 hours of time, for which he claimed at the rate of 8d. an hour. It was admitted that he had been paid the amount of the contract. Mr. Montagu Williams said that the complainant had received all that he had contracted for, and anything for loss of time would be a subject of civil action. The complainant's remedy was in another court. The summons was dismissed.

In Re Mackenzie, Maryport.—The statement of affairs filed by A. Mackenzie, builder, Maryport, shows that the total liabilities are £13,275, of which £1,657 will rank for dividend, the deficiency being £975. The debtor alleges as the cause of failure, "Heavy losses through the depreciation in value of property at Maryport, heavy loss on Maryport Baptist Church contract, and losses on farm." The Official Receiver says debtor commenced business as a builder and contractor in 1872, with a capital of £120, and as a farmer thirteen years ago, entering on his present farm at Allerby in 1886. He was also a partner in the Dearham Pottery, which, proving unsuccessful, has been discontinued, and the creditors have been paid in full, but the dissolution has not been gazetted. No less than £11,571 5s. is owing to secured creditors, the properties mortgaged being cottage and house properties in or near Maryport. Debtor had no proposal to make, and has been adjudged a bankrupt.

Within the last few weeks the wood pavement has been removed from the carriageways of King Edward-street, E.C., Billiter-street (part of), Aldgate (part of), and St. James's-place, S.W., and these streets are now paved with compressed asphalte, the material used in each case being that of the French Asphalte Company.

The extension of the Leeds Infirmary, which is nearing completion, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, those in the large wards having descending smoke-flues, and those in the smaller wards ascending smoke-flues, all being supplied by Mr. E. H. Shorland, of Manchester.

A memorial tablet has been placed in Acock's Green Church, near Birmingham, by the friends of the late Mr. J. F. Swinburne, J.P., from the design and under the superintendence of Mr. J. A. Chatwin, architect, Birmingham. The work is carried out in carefully-selected Derbyshire alabaster, and the details are of the most delicate character. The framework is elaborately canopied and crocketed, rising from a richly-ornamental mould which serves as the base, while at each side of the tablet proper are canopied niches inclosing figures of angels in full relief. The upper portion is divided into five canopies, the centre one, which is surmounted by a cross, being higher than the others. Immediately under this the arms and crest of the deceased gentleman form a centre for the inscription, which is deeply carved into the surface. The work has been erected under the personal supervision of the architect by Messrs. Jones and Willis, of Birmingham and London.

STAINED GLASS.

Bombay.—Messrs. Charles Bussell, Gibbs, and Co., are now completing for shipment 12 clerestory windows for the council chamber of the new Municipal Buildings, Bombay. The design is geometrical, with rich borders, and foliated pattern in the heads, and in the centres are medallions with shields, bearing the city arms. They have also sent a four-light window, divided by stone transoms into three panels, for the council chamber. This window is very rich in character, with foliated design in heads and border. The top and bottom panels have, in the centre, shields with devices taken from the arms of the corporation, and in the centre panels are full arms of the city with motto, "Urbs primus in Indus," with supporters on either side; the arms are also repeated in the tracery. These windows have been specially designed with regard to the strong Indian sun. They have also sent a large number (some three thousand) of small quarry and rondel panels for the tympani of doors to the various offices in the building. In addition to this, they have now in hand a large number of tracery lights for the tower, arcades, and entrances, all in rich foliated and heraldic patterns.

WATER SUPPLY AND SANITARY MATTERS.

Middleton.—Mr. H. Leonard Hinnell, Assoc. Mem.Inst.C.E., Proctor and Hinnell, civil engineers, Bolton, has been engaged by the corporation of Middleton to design a main drainage scheme, and carry out the necessary works for intercepting the sewage of the borough from flowing into the river Irk, a tributary of the Irwell, and also to prepare a scheme for the treatment of the sewage of the borough and adjoining districts at the outfall. The same firm are at present carrying out sewage disposal works for the corporations of Haslingden and Rawtenstall.

CHIPS.

The Manchester Corporation are carrying out an extensive system of sewage disposal. The contract for the precipitating tanks, covering an area of 11 acres, has been given to Mr. Geo. Bell, contractor, Tottenham.

The new recreation hall for the Young Men's Society, in Great Crosshall-street, Liverpool, is rapidly approaching completion. The building has been planned and designed by Mr. Frederick H. Peate, architect, of 11, South Castle-street, Liverpool, and Mr. Edward Blackburn, builder, of 5 and 7, Keble-road, Bootle, is carrying out the work.

Messrs. J. B. Joyce and Co., of Whitchurch, Salop, have just erected a large quarter-clock in Lichfield Cathedral, which shows the time on two dials, one fixed in the nave of the cathedral. The clock is adapted to chime to sets of quarters—the Cambridge quarters on four bells, and the ding-dong quarters on two bells. By turning a lever either of the quarters can be used, or the hammers entirely thrown out of gear. This is the ninth cathedral clock Messrs. Joyce have made.

Alterations have been made to the Public Hall, Petworth-park, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

A new dress warehouse in Stanningley-road, Leeds, was formally opened on Friday. It is four floors in height, and measures 60ft. by 36ft. The frontage is of local bricks, with stone dressings. The chief contracts, those for bricklaying, stone masonry, and joinery, have been carried out by Mr. Joseph Walker, of Leeds.

The Dowager Lady Williams-Wynn laid on Tuesday the foundation stone of the memorial church in the township of Brithdir, in the parish of Llanrhaiadr-yn-Mochnant, to be erected in memory of Bishop Morgan, who, while vicar of the parish three hundred years ago, "finished his great undertaking of translating the Bible into the Welsh language." The site is half-way between Llanrhaiadr and Llanfyllin, and the church has been designed by Mr. W. H. Spaull, of Oswestry, diocesan architect.

The Worcester board of guardians have adopted revised plans by Messrs. Rowe and Son, of that city, for workhouse schools to be built at an estimated cost of £6,750.

The Jubilee of the establishment of the Ordnance Survey Department at Southampton is being celebrated there during the present week. It was determined to move the Department to Southampton after a great fire in London in 1841.

On Monday the first sod of the drainage scheme about to be carried out by the Soothill Nether Local Board was cut by the chairman of that body. The engineer of the works is Mr. Malcolm Paterson, C.E., of Bradford, and Mr. Clarke, of Sheffield, is the contractor. The cost will be £12,500.

Our Office Table.

The special committee appointed by the Liverpool Corporation to consider and report on contracts have submitted their conclusions. It has not been proved to the satisfaction of the committee that contractors have unfairly dealt with their employés as to wages, or the undue introduction of apprentices. The committee consider that most evil has resulted from the universal practice of accepting the lowest tender—a conclusion that will meet with hearty and general approval. They found great difficulty in defining what was meant by "sweating," but accepted as a definition of a fair wage "not less than the minimum wage recognised by trade-unions, and for not more than the maximum hours." This is a fair and intelligible interpretation, agreeing closely in substance with the requirements laid down by the London County Council, who stipulate for "the standard rate of wages, and such hours as are generally accepted in the respective trades."

The fourth annual exhibition of the Yorkshire Union of Artists, opened at York on Monday, marks a considerable advance on previous years. A fresh contingent of painters have sent in contributions, and the rejections numbered over 150. All the artists whose works are hung are connected by birth or residence with the county of broad acres, and the list is headed by the P.R.A., who sends a portrait of the late Sir Richard Burton, well known by reproductions. Mr. E. Armitage, a native of Leeds, shows the "Woman Kissing the Hem of Christ's Garment," exhibited at Burlington House half a dozen years since. Mr. J. Thomson Dunning shows "Her Treasures," and Miss Edith Hudson, of Bradford, "The Executor." Other works of interest are "The Ouse from Lendal Bridge," and "Potato Gatherers," both by Mr. R. Jack, portraits by Mr. M. C. W. Flower, Mr. Eddison, and Mr. F. Suddards, and landscapes by Mr. Arnold Priestman, R.B.A., "The Head of the Bay," and Mr. Stead, "The Silvery Wharfe." Among the few architectural drawings those by Messrs. W. H. Thorpe, of Leeds, George Fall, and W. J. Boddy deserve a passing note.

The Senator Pietro Rosa, the excavator of the Palace of the Cæsars, and the most widely-known archæologist in Rome, died last week on the scene of his greatest achievement, the Palatine Hill, in the house built for him by Napoleon III. Among his earlier discoveries were the identification of the site of the Temple of Diana, on Lake Nemi, and that of the battlefield on the Allia; while he laboured hard to show that the villa of Horace was situate near Rocca Giovine, and not on the accepted site on the Digentin. His topographico-archæological maps of Latium were unfortunately never completed. From 1863 till 1870 he was intrusted by Napoleon with the excavations in the Farnesian Gardens, and he was wisely retained at his post by the Italian Government, who appointed him also Inspector General of Antiquities and the Fine Arts in the Roman province, and Keeper of the Archives of the Palatine. Of recent years the active work of excavation has been carried forward by younger men, Fiorelli and Lanciani. Rosa, who had grown very feeble of late, has passed away at the age of 71, and is buried in the Campo Verano, on the verge of the Campagna, whose past he did so much to disclose.

A representative collection of architectural ornament and sculpture is being formed for the Museum at Lucknow by Mr. Edmond W. Smith, of the Archæological Survey of India. Some of these are actual specimens, but others are plaster of Paris casts, of which duplicates ought to be procurable at a comparatively slight expense for the Indian Museum at South Kensington. The casts already prepared for the Lucknow Museum include numerous illustrations of the ornament used by Akbar in the 16th century in embellishing his buildings at Fatehpur Sikri, as well as many examples of the elaborate details in stone and stucco from the Hakim's quarters and Birbal's house in the same village. Liberal grants by the Public Works Department and the museum committee have enabled Dr. A. Führer, the curator, to finish the excavations of the Kankalf Tila at Mathura. The results of his work far surpass those of the previous two years, as the new finds form important additions to our knowledge of Indian history and art. He for-

warded to the museum 737 fine pieces of sculpture, comprising beautifully finished panels, doorways, toranas, columns, complete railings with copings and bars, statues of Tirthamkaras, &c. Amongst these sculptures there is one which possesses considerable archæological interest. It is a torana bearing a relief which represents a stupa worshipped by Centaurs and Harpies, or, as the Hindus would say, Kinnaras and Garndas or Suparnas. Centaurs have been found on the Buddhist sculptures at Bharhut and Gaya, while Mathura has furnished the Silenus groups and Hercules strangling the Nemean lion. This new find is a further addition to the monuments which prove the influence of Hellenistic art among the Hindus of the last centuries preceding our era. Sixty-two of these sculptures are inscribed, bearing dates varying from 150 B.C. to A.D. 1023.

The electric light is being introduced upon a very comprehensive and satisfactory plan in Paris. The municipality has spent 2,000,000 francs in making a central electrical installation of its own in the basement of "Les Halles Centrales," which is the principal market, from which centre the illumination of a number of public buildings is conveniently managed. For the purpose of a general system of electrical lighting, the city is divided into seven *secteurs électriques*, the dividing lines of these *secteurs* or segments being made to radiate from the Halles as a centre, and each segment is granted for a short term of years to a responsible company. Edison has one, Victor Popp (using the Thomson-Houston system) has two segments, and so on. It is said that before the end of next year every street in Paris will be illuminated by electricity, and that every house will be able to be supplied with it. Every company is required to make their installation at once, so that the particular district they undertake to light shall be served with main cables. Other cities may profitably follow suit.

In his annual report to the Birmingham city council on the public works carried out during the year ended on March 31st last, Mr. W. S. Till, the city surveyor, states that wood pavement has been substituted for macadam in many of the leading thoroughfares, and in other cases the macadam has been replaced by granite paving. The amount spent on street watering and sewer flushing was largely in excess of previous years, and nearly double the quantity of water was used for these purposes in 1890 as compared with 1889. Some progress has been made in lighting the private courts, and plans, estimates, and apportionments having been made, notices were served on the owners of 440 courts requiring them to provide the means of lighting. The staff employed in the public works department under the Birmingham corporation now numbers 758, and there are now 205 miles of streets and 207¼ miles of sewers in the city.

The Architectural Association.—Scholarships.—The Committee of the Architectural Association is prepared to award two Scholarships, value ten guineas each, tenable for two years, to students intending to take up the Association's first and second year's courses. Likewise two similar Scholarships to students intending to take up the third and fourth years' courses. Applications, accompanied by specimens of drawing, to be made in writing on or before the 18th day of September, 1891, addressed to the Hon. Secs., 9, Conduit-street, W., stating the age of the applicant, particulars of his previous education, and any other information likely to be of assistance to the Committee in making its selection. The successful applicant, if not already a member of the Architectural Association, must become one in the ordinary way.

ERNEST S. GALE
F. T. W. GOLDSMITH } Hon. Secs.

The Croydon Board of Guardians, at their meeting on Tuesday last, adopted the plans of their architect, Mr. Frederick West, for the erection of union-offices and board-room, at an estimated cost of £6,500.

New board schools for 300 children will be opened on Monday next at Exmouth. The plans were prepared by Mr. Frank Carter, described as the clerk to the school board, and Mr. W. H. Perry, also of Exmouth, was the contractor.

During Wednesday's gale, a Congregational Church in course of erection on the London-road, Marsbrook, Sheffield, was blown down. The iron roofing was lifted off bodily. The framework was thrown down, and then the columns and principals gave way, and a mere heap of wreckage remained. The church was to have been opened on Tuesday week the 17th inst. At Fleetwood, serious damage was caused to the new market in course of erection at a cost of £5,000, on the Victoria-street side, where the wall fell. No one was injured in either case.

Trade News.

WAGES MOVEMENTS.

EDINBURGH.—The Edinburgh and Leith Master Builders' Association have issued a circular asking all employers of masons in Edinburgh and Leith to adhere to the resolution of 8th June to pay masons 8d. an hour, and any who may have paid a higher rate are requested to immediately give notice that, from and after the 24th current, the general rate for competent masons has been 8d. per hour.

LINCOLN.—The strike of builders' joiners at Lincoln, which commenced three weeks ago, still continues. In one or two instances the masters have conceded the demands of the men, which are for ½d. an hour advance now, and another ½d. to take effect on the 1st May, 1892, if the then state of trade should warrant the increase. The members of the Lincoln Master Builders' Association hold out against the demand, but are willing to concede ¼d. advance, which the men refuse to accept. The men also desire that a set of working rules should be signed by the masters. The bricklayers of Lincoln are also making a demand for an advance in the rate of their pay.

The town council of Chelmsford elected on Wednesday Mr. G. H. Sasse, assistant surveyor to the Tendring rural sanitary authority, as borough surveyor, in succession to Mr. C. L. Green, resigned. There were 101 candidates, and the salary is £250 year.

Holloway's Pills correct bile, prevent flatulency, cleanse the liver, and purify the system, renovate the debilitated, strengthen the stomach, increase the appetite, invigorate the nerves, promote health, and reinstate the weak to an ardour of feeling never before expected. They are indeed a blessing to those who suffer from disorder, internal or external.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear.
VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ALDERTON, NEAR EVESHAM.—For repairs and alterations to the Wesleyan chapel:—
Oakey, Winchcombe (accepted).

BARTON REGIS.—For the erection of a master's house at the workhouse, for the board of guardians:—
Beaven, A. J., Bristol (accepted) ... £880 0 0

BRENTWOOD, ESSEX.—For a villa for Mr. S. Ray, Queen's-road. Mr. A. T. Woods, architect:—
Ansell, A., Billericay ... £888 0 0
West, E., Chelmsford (accepted) ... 810 0 0

BRADFORD.—For repewing, redecorating, and ot alterations to the United Methodist Free Church, We gate, Bradford. Messrs. Rycroft and Firth, Bradfo architects:—
Joiners' work:—Holdsworth, J. W., and Co.
Heating and ventilating:—Hargreaves and Dewhurst
Plasterers' work:—Barker and Dixon.
Painting and decorating:—Collinson, W.
All of Bradford.

BRIDGEND, GLAM.—For building a new post-office:—
McGaul, Bridgend (accepted).

BRIXHAM.—For alterations and additions to house a shop, Fore-street, Brixham, for Miss Browse. Mr. G. Bridgman, V.P.S.A., Torquay and Paignton, architect
Rabbich and Brown, Paignton ... £595 0 0
Yeo, R., Torquay 550 0 0
Webber, H. Paignton (accepted) ... 448 0 0

BRIXHAM.—For alterations and additions to house a shop for Mrs. Edwards, Brixham. Mr. G. S. Bridgm V.P.S.A., Torquay and Paignton, architect:—
Yeo, R., Torquay (accepted).

BURY, LANCASHIRE.—For new roof, &c., to machi house, Elton Paper Mills, Bury, Lancashire. Quantit by Mr. C. J. Ford, 3, Clifford's Inn, E.C.:—
Tinline, J. £1,637 0 0
Byrom, J., Bury (accepted) ... 1,399 0 0

EALING.—For decorations to Ealing Congregatio Church and Manse. Mr. G. A. Lean, 8, Union-cou Old Broad-street, E.C., architect and surveyor:—
Penny and Co. £118 0 9
Nye 110 0 0
Jones Bros. 104 10 0
Myring 102 0 0
For alterations and additions to Manse:—
Penny and Co. 176 0 0
Nye 150 0 0
Myring 148 0 0
Jones Bros. 125 0 0

ESSEX.—For addition to Stondon Massey schoo Essex, for the Rev. E. J. Reeve, M.A. Messrs. J. Newman and Jacques, 2, Fen-court, E.C., architects:—
Barlow £182 0 0
Noble 170 0 0
Lemon (accepted) 125 0 0

EVESHAM.—For the erection of the Drift on the Gree Hill Park Estate. Messrs. Gant and Slatter, 11, Hay lock-road, Hastings, architect. Quantities by the arch tects:—
Taylor, F. W., Evesham (accepted) £2,266 0 0

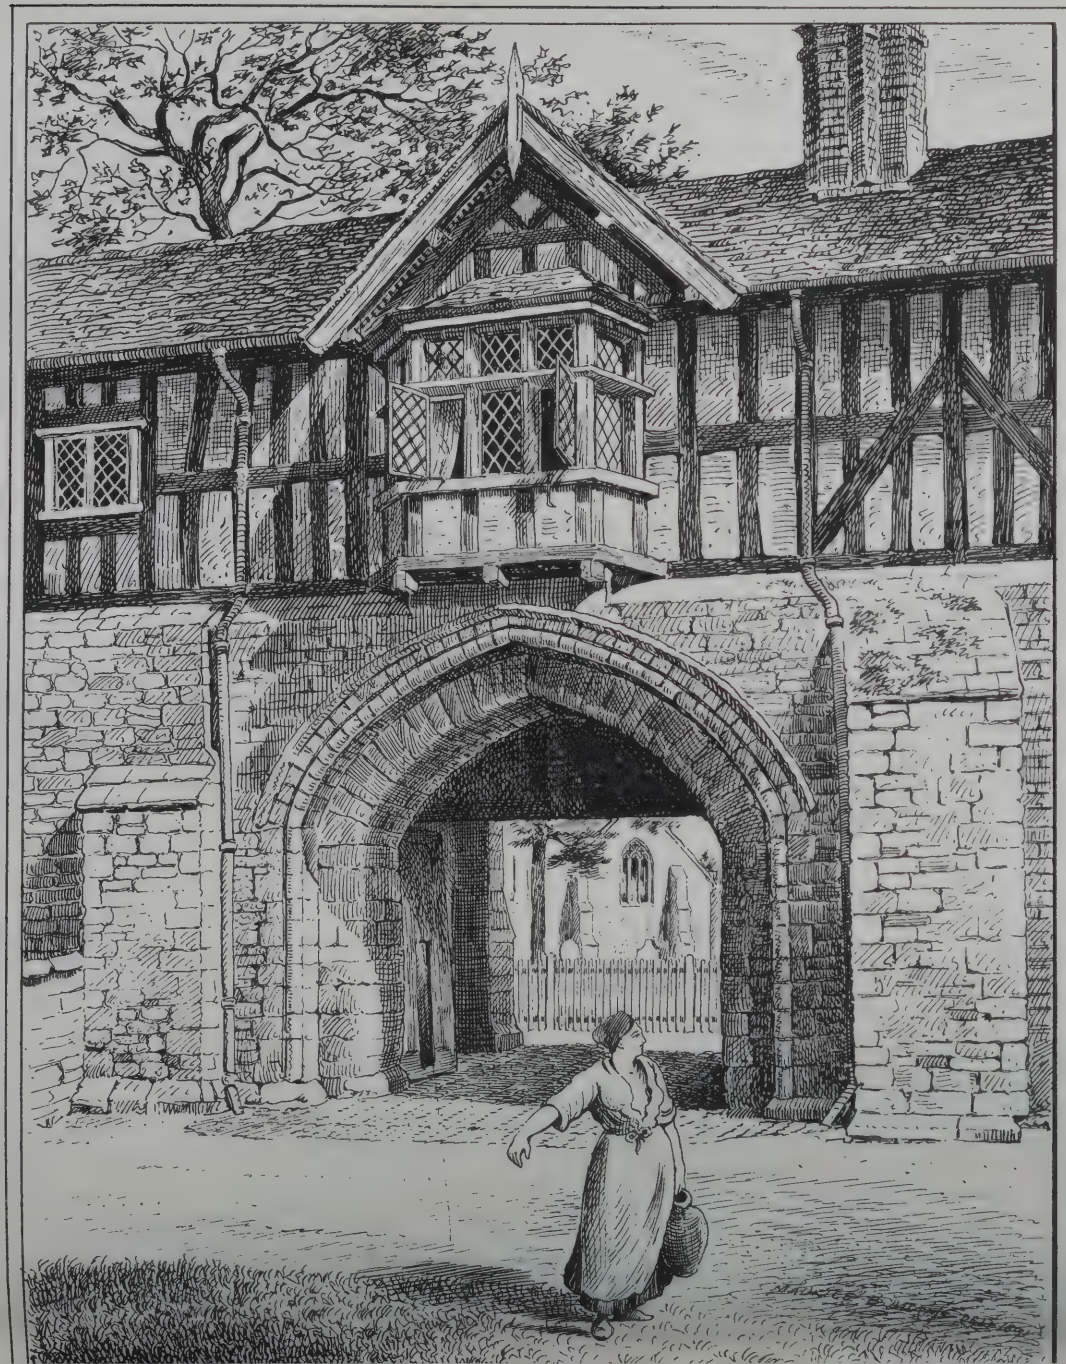
GUILDFORD.—For the erection of a steam-roller she for the highway board:—
Banham, R. H., Stoughton (accepted) £42 0 0

HOLLOWAY.—For alterations to the Prince of Denma public-house, Junction-road, Holloway, for Mrs. Hu son. Mr. E. A. Hawkins, 47, Mark-lane, E.C., arch tect:—
Crane, J., Stoke Newington ... £542 0 0
Little and Senecal 540 0 0
Evans, W., Holloway 531 0 0
Stevens, T. 519 0 0

INGRAVE, ESSEX.—For the erection of pair of cottag for Mr. L. French:—
Ansell, A. (accepted) £200 0 0
(No competition.)

IPSWICH.—For building 23 houses on the estate of t Freehold Land Society between St. Nicholas-street a Friars'-road:—
Grimwood and Sons... ... ... £5,943 0 0
Grayston, W.... ... ... 5,910 0 0
Coe, A... ... ... 5,850 0 0
*Borrett, C. 5,775 0 0
*Catchpole, E. 5,750 0 0
Gibbons, O. T. 5,690 0 0
Pells, J. (withdrawn) 4,950 0 0
* Contract divided between these builders.

KENSINGTON.—For alterations, additions, and decor tions at 23, Elvaston-place, South Kensington. Mr. J. W Rhodes, 3, Clifford's Inn, E.C., architect. Quantities Mr. C. J. Ford, 3, Clifford's Inn, E.C.:—
Bowden and Co. £2,796 0 0
Wetton, E. A. 2,703 0 0
Shillitoe and Son 2,340 0 0
Stevens, T., London (accepted) ... 2,249 0 0



LEWISHAM.—For Davenport-road, Lewisham. M H. A. Alexander, architect:—
Adams £978 0 0
Botterill 917 0 0
Catley 889 0 0
Rackham and Bentham 788 0 0
Mayo 785 0 0
Wilson 784 0 0
Barlow and Roberts 731 0 0
Warner 730 0 0
Hall 720 0 0
Parry 720 0 0
Osenton 713 0 0
Fletcher 675 0 0
Bell 667 0 0
Woodham and Fry 645 0 0

LEWISHAM.—For finishing a terrace of five houses. M H. P. Monckton, F.R.I.B.A., 32, Walbrook, E.C., arch tect:—
Robson £560 0 0
Barnwell 374 0 0
Tattersall 308 0 0
Bryant (accepted) 301 0 0

LICHFIELD.—For alterations to the board-room of th board of guardians:—
Thorneloe, J., St. John's-street, Lichfield £106 0 0
(Accepted).

LITTLE BURSTEAD, ESSEX.—For the erection of churc schools, for the Rev. H. G. Bushey. Messrs. Newma and Jacques, architects:—
Letch, Braintree £520 0 0
Bruty 378 0 0
Ansell, A., Billericay (accepted) ... 333 0 0

LLANDUDNO.—For the erection of a mortuary, for th improvement commissioners:—
Hughes, E. (accepted) £66 15 0
(Lowest of two tenders received.)

HE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1913.
FRIDAY, SEPTEMBER 4, 1891.

HE PUBLIC HEALTH (LONDON) ACT.

HE full text of the Public Health (London) Act, 1891, just issued, enables o glance at some of the main provisions ch concern building and the abolition of sances in the Metropolis. Hitherto sanitary slation as it affects London has been far ind that of the provinces. The new Act solidates and amends the provision of a e number of old Acts, repeals 16 Acts, and ially 19 others, and practically applies to don the principles of the Public Health of 1875 which has been in operation in our provincial towns and rural districts e the last date. Why the Metropolis has a so long left behind other towns in sani- legislation it is hard to say, except that old enactments have lain in the way of a prehensive scheme. The new Act of Mr. hie comes into force in January next. vill probably not be heartily entered by some of the vestries and district ds, who think that their interests have interfered with, and too much of their er centred in the County Council; but concessions made by Mr. Ritchie will tically give the vestries and boards more power than they have hitherto essed. The sanitary authorities for the ution of the Act will be in the City the missioners of Sewers; in the parishes tioned in Schedule A to the Metropolis agement Act, 1855, and amended by Act of 1885, and the Battersea and West- ter Act, 1887, other than Woolwich, estry of the parish; and in each of the icts B to the same Act, the district l; in Woolwich the local board; and in place mentioned on Schedule C the l of guardians or overseers of the poor. County Council reserve power to prose- in case of default of the sanitary ority, and do any act which the ority might have done, and to recover expenses; and they may also make plaint to the Local Government Board of default (Secs. 99—101).

e powers given to the sanitary authority y district enable them to make inspec- of their district from time to time to what nuisances exist and to abate the . Certain nuisances may be dealt with narily, amongst them premises in such te as to be a nuisance or injurious to h; foul or insanitary closets, cesspools, s, cisterns, watercourses, and gutters; leposit injurious to health, overcrowded s, absence of water-fittings; factories workshops which are uncleanly, badly ated, or overcrowded. Certain reser- ns and exceptions are made, however. uthority may in some cases specify the s to be executed, and serve a notice on wner to do what is necessary for pre- ng the recurrence of the nuisance. For nces arising from any want or defect of ctural character, or where the premises ccupied, the notice is to be served on vner, so that tenants will not be troubled defects for which they are irresponsible. ub-clause enables the medical officer to y to the authority if any house or part ne is so overcrowded as to be injurious lth—a very necessary provision where ny houses are tenanted by two or three es.

n-compliance with notice may result in plaint of the authority, and the petty nal court may make a nuisance order, may either be an abatement order, a prohibition order, a closing order or a combination of such orders. Thus, a closing order may prohibit a house from being used for habitation if it is unfit for that purpose, and a fine of £20 may be imposed. A fine of 40s. a day is imposed upon any person acting contrary to a closing order, and the authority may enter any premises and do what is necessary to abate a nuisance; but a person may appeal to the court of quarter sessions against an order which is, or includes, a closing order, or which entails structural work; but, to prevent litigious appeals, the authority can fine any person 20s. a day during the non-compliance of an order unsuccessfully appealed against. Section 10 enables an authority to enter premises to find out any nuisance at any hour by day. Sanitary authorities are empowered to make by-laws for the cleansing of streets and the prevention of nuisances, and these include those arising from snow, ice, salt, dust, ashes, or other matter; and for preventing any offensive matter running out of any manufactory, brewery, or slaughter-house, butcher's shop, &c.; for paving yards. The Council can make by-laws for prescribing the times for the removal by road or water of any offensive matter in or through London; and for the proper construction of the carriage or vessel; and for the filling up of cesspools or privies, removal of refuse, &c.; and any person may be arrested without warrant who is found committing offence against these by-laws, and who refuses to give his name and address. Penalties are enforced for keeping animals in unfit places, and Section 19 deals with offensive trades, and enacts certain regulations and penalties for the establishing anew of blood and bone-boiling, soap-boiling, cattle and horse-slaughtering, and other offensive businesses. Licenses are required from the County Council for the use of premises in London for slaughtering, cow-houses, or knacker's yard. A very important provision (22) enacts that house and street-refuse collecting and depositing, being a business carried on by a sanitary authority, shall be amenable to the County Council, who are empowered to take proceedings, also that premises used for the disposal or treatment of house or street refuse which are a nuisance are liable to be summarily dealt with. Many receptacles and pits now used by sanitary authorities would be liable under this clause. Other sections provide for the construction and regulation of furnaces of factories, gasworks, and other buildings used for manufacture, so that they may consume the smoke; for inspecting workshops and bakeries, cleansing them, the registration and control of dairies, their lighting, drainage, and ventilation; the removal of refuse from streets by authorities, who are liable to a fine for not cleansing them in due time.

The Act, as it applies to buildings in the Metropolis, relates especially to regulations as to water-closets, provisions as to water supply, houses let in lodgings, and underground rooms. As to the first of these, we may briefly say that any newly-erected or rebuilt house is to be provided with ashpit with proper doors and coverings, and one or more proper water-closets, in default of which a fine of £20 is to be imposed. Houses built before or after the operation of the Act are subject to the sanitary authority's power in these respects, and they may serve notice on the owner or occupier to supply the deficiency. Sect. 39 empowers the County Council and sanitary authorities to make by-laws with respect to the water supply of closets, ashpits, cesspools, &c. A fine is imposed for any improper construction or repair of water-closet or drain which causes a nuisance, and, in short, the sanitary authority has power to authorise an inspection of all closets, and to compel the owner or occupier to do what is necessary to put the apparatus or its connections in proper order and condition. The provisions as to a water supply apply to all occupied houses without a "proper and sufficient supply" which are regarded as "nuisances," and liable to be summarily dealt with. Newly-built houses are not to be occupied until the sanitary authority have certified that they have a proper water supply; the cleansing of cisterns is provided for in section 50, which enables the authority to make by-laws, and public fountains, cisterns, and reservoirs are to be under their control.

Sanitary authorities are vested with very useful powers in sect. 94, to make by-laws as to houses let in lodgings, for the purpose of fixing the number of persons who may occupy a house or part of a house which is occupied by members of more than one family; for the registration of such houses, their inspection, drainage, ventilation, &c. No less important are the provisions (Sect. 96) as to the occupation of underground rooms not let or occupied separately as a dwelling before the passing of the Act. The rules laid down are, briefly, that the room so let is at least 7ft. high, and has at least 3ft. of its height above the surface of the street or ground adjoining; provided that if the width of area is not less than the height of the room from the floor to the surface of street, the height of room above such surface may be less than 3ft.; but in no case is it to be less than 1ft.; and the width of area need not in any case be more than 6ft.; that a proper damp-course be inserted in every wall, which is to be secured against dampness from the soil; that an open area be provided of the entire frontage of the room, extending from 6in. below the floor level, properly paved, at least 4ft. in width; that the area and soil below the room be drained; that the space below the floor be sufficiently ventilated; that any drain under the room be constructed of a gas-tight pipe, that exhalations from the soil are excluded, that a proper w.c. and ashpit be attached, that the room be ventilated, and have a fireplace with proper flue, and one or more windows opening into the external air of a total clear area of at least one-tenth of the floor area of room, one-half of which window is to open. A penalty of 20s. per day is imposed for occupation of a room let contrary to this enactment. These provisions are to extend to rooms previously occupied at the expiration of six months after the Act comes into force, unless the authority dispense with or modify them. Owners may appeal to the Local Government Board if such dispensation be not granted. The powers vested in the authorities are subject to modification: they can dispense with the provisions for a time, or they may be varied by the authority. When these enactments come into force we may expect an appreciable improvement in the health of the Metropolis. The rules we have just referred to will have one desirable effect if they serve to diminish the number of persons living in certain localities and distribute them over a wider area; they will also give an impetus to sanitary rebuilding.

THE DESIGNING OF WINDOWS.

THOUGH a common element of all architecture, the window possesses a significance which can scarcely be surpassed by any other feature. As the light-aperture, it has its function in bestowing health and cheerfulness on the inmates of a building; as an element of architectural design, it is a powerful means of expressing character. And yet, strange to say, it is one of those things which are left pretty much to the mere whim or taste of the designer. Its two-fold purpose requires that it should be determined by both the plan and elevation of the building, but the ordinary process is to make its size depend on the appearance, as studied in elevation, as if it had little to do

with the interior. A window is put here or there, made a little larger or smaller, higher or wider, as a single opening or divided into lights, to suit the elevation or the amount of space at disposal. It is sometimes a question of filling up a space in width, sometimes a question of height. This one-sided mode of deciding by external elevation cannot be a satisfactory method, for we get in one room perhaps two or three windows, and in another room only one, quite irrespective of the area or size of the apartment. In one part they may be heaped all together, as in one corner of a room; and the other corner left in darkness. We know these awkward and inconsistent distributions of windows often occur in public buildings in the Classical style, much to the discomfort and inconvenience of officials and clerks. Some of the rooms of the War and Foreign offices suffer from this uneven distribution of light; and we may recall to mind many a modern municipal building in which the studied regularity of the fenestration has completely sacrificed internal light and convenience, and has been made the excuse of perpetrating many absurd arrangements.

To avoid these anomalies, windows ought to be fixed in position by the plan, having regard to the main divisions of the façade. The question of how to determine the width and number of apertures is important. Here physical conditions come into play. As the rays of light proceed in parallel lines from a window receiving light from an illuminated sky surface—and this view is practically correct—we may assume that the size and proportion of a window-opening will be the best guide to the size and proportion of a room that can be efficiently lighted by it. Thus, roughly, a long and narrow room, with a window at one end, will be best lighted by a tall, oblong opening; or, if the light is to be admitted along one side, two, or more, short windows will be sufficient. This conclusion will be apparent if we consider that a window of, say, rectangular shape, admits a prism of light of a sectional area equal to the opening, and we assume a certain angle or obliquity to the rays. If we take the section of a window opening in a wall, and draw a line from its top edge of the assumed angle and another parallel thereto from the sill or lower edge of window, we represent the direction of such a prism of light entering a room. Extending these lines to the floor-level, the latter becomes a horizontal plane, and will show how much of the floor will be illuminated directly by the window; the higher the window-head the farther the rays of light will extend into the room, and a good idea will be obtained of the length the room ought to be from the window. Also, the nearer the window-opening is to the floor the greater will be the extent of illuminated area, and the loss there will be of a dark or unillumined corner under the window. For practical purposes we may assume the angle of the light rays to be 45° above the horizon, so that if the window-head is, say, 12ft. above the floor-level, the prism of light will extend the same distance into the room. A simple geometrical construction of this kind will enable the architect to proportion the proper height and width of his window apertures without having recourse to any calculations, such as are met with in treatises. The rule is easy, and can be quickly applied by drawing lines on the section to the angle at which the light is supposed to enter, or in making the depth of room from the outer wall not much more than the height of the window. It may be remembered for all practical purposes that in this dull climate of ours, when the sun so seldom shines directly on a window, the effective portion of the illumination received through a window is that derived from the sky; and, secondly, that the principal portion of such light comes from the upper part of a window, that near the zenith; hence, that the higher the window, the more intense the light. That near the horizon is often obscured by fog or smoke or opposite buildings. Geometrically we may represent the available sky surface as half a hemisphere placed with its flat side to the window. We describe, in other words, on the plan, a semicircle of any radius from the centre of the window on the outside, and from the same centre and with the same radius a semicircle on elevation. Between these semicircles we can imagine the quarter sphere of the sky. This may be divided into zones by horizontal semicircles from the zenith to the horizon, of a certain number of degrees each —say 10°; also, we can divide the same quarter sphere vertically by quadrants, the same number of degrees apart, and we can affix a value to each division or sector between these two sets of lines. In this manner it is easy to calculate the light entering a window in any direction, and also the amount of light shut out by any obstruction. As our readers know, this plan of considering light and obstruction is employed in estimating the amount of obstruction in light cases; but the system is of equal value in ascertaining the quantity of light from the illumined sky which enters a given form of window, and it is for this purpose that we refer to it now. It is shown by all authorities on light that the intensity of light from any part of such a sphere is proportional to the sine of the angle of altitude above the centre of window at the bottom. At the zenith, for example, we may call the intensity 1,000; while at a point lower down, say at an angle of 30° from the zenith, the same area will be represented by 866; and at an angle of 45° by the figure 707. Along the lower zones the intensity of light declines till at the horizon it is nothing. It is also worthy of notice that the intensity of light received from the portion of the sky or sphere above an angle of 45° is equal to that of the surface below it, though their respective areas are very unequal as measured on the sphere. If architects bore in mind this fact, they would see the necessity of placing their windows high in the room instead of low down; also, when light is essential, preferring clerestory to wall openings in some cases. Thus a long horizontal opening below the ceiling gives the best light, but such an aperture would not always be desirable.

The form and proportion of the window apertures are essential. A great deal may depend on the style and destination of the building; but we now confine our attention to the principles, physical or geometrical, which should guide the architect in giving a form and proportion to his windows, irrespective of the consideration of style. For agreeable proportion as applied to a plain rectangular window opening, we may take the windows of Somerset House, which are two squares in height, or 2 to 1. Palladio generally used a double square, and this proportion is generally followed by the Italian architects. Examples are found in Chambers's "Treatise on the Decorative Part of Civil Architecture," and also in Gwilt's "Encyclopædia." But inflexible rules are useless, simply for this reason—that more light may be necessary in one room than another; and we have the differences of position, obstructions by opposite buildings, and other circumstances to consider in each case. The most desirable proportion for an aperture should be regulated by the shape of the room; thus, if it is a long room, and the window or windows are at one end, they should be tall, so that the light through their upper portions may penetrate well into the room. With regard to the size of window, one good rule is to find the cube of the room in feet, and the square root of the product will give the area of the opening in feet, which may be given to one or more windows as required. do not place much confidence, howev any rule which must be arbitrary, therefore cannot apply to bright and outlooks or to varied degrees of ligh is far more reasonable to consider amount of illumined sky surface l a given window or front of wir in the manner we have described, to proportion the apertures to the a amount of light available under a n condition of sky. Thus, in dar thoroughfares the windows ought to be and tolerably wide, so that as much zenith light may be secured as possibl further, projecting pediments, balconie cornices should be avoided or reduce is better to err on the side of too than too little light, so that the er of buildings may not seriously darke rooms. The heads or upper portions windows are often darkened by tra heads, painted glass; hence the importa making all decorative windows larger i than absolutely necessary for light, o those which are plain and merely fil with transparent glass. We very oft this rule neglected. Semicircular hea filled with carving in stone or terra modelling, or mullions carry perf tracery, so that the most efficient part window is lost or the light is reduce considerable extent. A strong objecti the ornamental headed window is tha actual light aperture is necessarily l the room to give space for the sculp tympanum or tracery. Another archite arrangement ought to be noticed, qu objectionable. In elevations of façade is often a full-membered entablature summit, and this, for the sake of con tion, is generally placed so that the member or cornice is below the roof the consequence of which is that the depth of entablature occupies a consid space down the wall below the ceiling and the windows have to be placed consequence, their heads being bene soffit of entablature, with a blank s walling over their inside. We have serious impediment to effective light windows, as the windows are too admit the best light, and the projec entablature over obstructs the rays d overhead. The difficulty is often r omitting the lower members of entab and in placing the cornice as high a sible. If there is a parapet and bal to act as a counter-weight to th nice, the latter may be placed the plate-level of roof, so that pl headroom be obtained for the windows. One way of getting over th culty is by the dormer; but the arrangement is expensive. A friez often be perforated to admit light un ceiling in addition to windows. The of wide piers between windows in or is that dark shadows are cast; there is an advantage to group windows to other than to separate them by wide of wall.

The decorative treatment of windo larger subject than can be dealt with article. In Eastern countries the was small and unimportant as an tectural feature; its development h simultaneous with the necessary enlar of the aperture. The growth of M architecture is largely identified w increase of the light aperture, as the of Gothic tracery will at once reco comparing Early Romanesque or with Late Perpendicular. But th nary window, with its accompanim a product mainly of the Italian sance. At first a mere aperture f in a wall, it soon began to develop and significance. We have, first, th trave and pediment as a frame, as w the Farnese Palace, Rome; the Refo

ll Mall; and Somerset House; then we ve the lighter palatial style of Venice in h palaces as the Vandramini, and the aro, or the well-known library of St. rk, where two orders inclose arcades and nings of considerable area with a range panel lights in the upper frieze, with the ious intention of obviating the dark, nk space above the main arcade of win-vs. In these and other instances the ds are reduced to a minimum, the wall appears, and attention is concentrated tead on the orders of columns which form piers and the horizontal lines or arcades. e process has been similar to the growth window tracery; at first there was only aperture—a mere group of lancets—which time began to be placed nearer together mere mullions intervened, and at length late" was exchanged for "bar" tracery. another article we may indicate how im-tant the fenestral disposition is to the ign. The whole character of the com-ition is altered by the arrangement of window.

NONCONFORMIST CHURCH BUILDING.*

By James Cubitt.

CHAPTER III.—SELECTION OF A DESIGN.

HE point has now been reached at which the committee have before them a ign or competing designs for their pro-ed building. On their action now its cess or failure will mainly depend; and ore they finally approve a design in the e case, or make a selection in the other, a ge number of points need careful consider-n. These may be arranged under the lowing heads:—

. Materials and cost.
. Arrangement of plan.
. Architectural style.
. Internal and external design.
. Acoustics.
. Ventilation, warming, and lighting.

t is not necessary, however, that the rming and lighting arrangements should worked out *in detail* at the beginning, the same may be said of—

. Internal fittings and furniture.

1.—MATERIALS AND COST.

These two subjects can best be treated to-her, because the cost greatly depends on materials adopted. There is doubtless a ce in the world for buildings, and espe-lly for churches, on which money can be ely spent, and to which nothing is dged that can contribute to perfection. say that no religious architecture ought rise above the level fixed by convenience decency, is like saying that no sacred sic ought to rise above the level of a nn tune. Costly buildings, however, are essarily few, and amongst Noncon-nists the pressing question is often how to ke the best of very limited means. It is ouraging to remember, then, that most lised nations, at one epoch or another, e found it possible to treat *all* their ldings artistically. This is a fact too ch lost sight of. If Classic architecture amed, people think at once of a temple; post-Classic architecture is talked of, y imagine a cathedral, or something of al importance. Yet temples and cathe-ls were quite exceptional works, treated quite an exceptional way. Along with m and around them there was a whole ld of every-day architecture for every-purposes, and a cheap architecture for se who found economy imperative. The ages of olden times were often, in a se, as artistic as the cathedrals, and the e may be said of a multitude of other works in the ascending scale from the lowest to the highest.

There is no reason, then, why cheap churches should not be as perfect in taste as costly ones; but the first condition of this is that they must be perfect in a different way. They must rely, not on grandeur and symmetry, but on picturesqueness, interest, and individuality. They must give up the idea of having the "highest spire in the neighbourhood," and must concentrate their means on doing thoroughly and effectually the things which it is really important to do. They must be built mainly for the sake of the worshippers within, and not mainly for that of the passengers without. If they need to sacrifice anything, they must sacrifice the exterior to the interior; they must give up ornament to gain dignity, and prettiness to gain permanence. They must, in short, be their own best selves—realities and not reflections—and must develop their own character and their own possibilities, which only need cultivating to take and hold, even in the art world, a yet unfilled position.

There are, broadly speaking, three main types of internal construction available, depending on three different materials. These are (*a*) wood, (*b*) iron, and (*c*) stone. In this order they go from the cheaper to the dearer, and from the less to the more monumental. In other words, there are three principal ways of dealing with the internal supports of a building, of which the columns and arches are the chief. The outer walls form a separate question, and may be of brick or stone or concrete, whichever happens, in each particular locality, to present most advantages.

(*a*) For the very cheapest class of church interiors there is much more to be done with woodwork than has ever been effected yet. Merely to get rid of the ugly pretentiousness of the cast-iron column, and to substitute an artistically-treated wooden shaft, is by itself an immense improvement. And not only for columns, but for many other internal details, we have in wood a cheap and easily-worked material, pleasant to the eye, and needing, except where it is freely exposed to handling, neither paint nor varnish. Unvarnished woodwork, even of common deal, grows richer in colour and more beautiful in tone with every year that passes over it. For internal work, it lasts as well without paint or varnish as with them, so that in a church these things are quite unnecessary, unless it be on doors and pewing. Wooden linings to the walls, indeed, are not to be generally recommended. There is no cheaper material in this position than plaster; and if treated *as* plaster, and not made into an imitation of something else, it is capable of more beauty and refinement than it often gets credit for. The weakness of wall-plaster is, that if used by itself in large surfaces it looks uninteresting and unconstructional. It does not give the idea of strength or of solidity. But these qualities can be easily imparted to it by interspersing it with piers or bands or occasional patterns of brick or stone. Such things cost little, and they instantly mark the fact that beneath the plaster there is a solid wall, and not a mere lathed partition.

Quiet and skilfully-managed colouring, again, blending walls, roofs, and windows into one harmonious whole, will of itself make the most unpretending interior attractive; yet nothing can be cheaper. It only needs to design the window-glass and to tint the walls so that they and the woodwork of the roofs and columns and seats will be mutually helpful in colour, and not mutually destructive. The chief risk here is the risk of what may be done after the building is finished. One or two conspicuous patches of bright red or bright blue, subsequently added, will probably be enough to nullify, in the way of colour, all which the best decorator can accomplish; and if, for instance, there is any pierced woodwork in the place, someone or other will probably want to back it up with crimson cloth. Much interest may be given to a church of the simplest sort by the treatment of the glazing; not by putting to it raw and staring borders of ruby and ultramarine, and still less by inserting the terrible "memorial windows" of the cheap glass-painter, but by getting the architect to give a little thought and care to the patterns. The additional cost of a few varied designs in the lead lights is trifling, and the gain from thus breaking up the monotony of squares and quarries is very great. Then, again, much of the cost of stone dressings can be saved by using instead a superior sort of brick—for jambs, arches, and quarries—and this not only without but within the building. If the roof of the church is tiled, tiles of different, but harmonious, tints, mixed at random, will give some display of colour, and prevent harshness and rawness; while, if it is slated, the smaller the slates are, the cheaper they will be, and the more artistic their effect. In these, and many other ways, there are all sorts of possibilities, even in the most economical kind of work. The great thing to remember is, that it is better to start with a modest scheme, and do it well, than to adopt a too ambitious one, and starve it down.

(*b*) In cheap churches of large size—those, for instance, seating from 800 to 1,500, or more—wooden columns are scarcely suited to carry the weight of the roof. And, again, in buildings as large as this, the danger of loss of life from fire has to be taken into account. With a small congregation this risk is seldom serious, for in case of danger everyone can rapidly escape. Now, for superior strength, combined with economy, one naturally looks to iron or steel; but for fireproof qualities, even wood itself, if in large scantlings, is better. Iron and steel, indeed, will not burn, but when heated they will bend; and an iron column will bend sooner than a wooden post of the same strength will burn. Cast iron, especially if unprotected, is amongst the least fireproof of all materials.* In concert halls and music halls, therefore, structural ironwork has, by law, to be inclosed in concrete or some similar material for protection. The same rule should undoubtedly be applied to all public buildings above a certain size. In London and other large towns there are numerous places of worship holding from 1,000 up to 3,000 or 4,000 people, and depending entirely on unprotected iron columns. Almost any one of these buildings, if the fire once got hold of it, would collapse in half an hour, or very likely less. Whatever may be done about these existing structures, it is quite clear that no more of the sort should be built—at least, of similar size. All ironwork, and iron columns in particular, should be thoroughly embedded in a mass of non-conducting material.

This necessity, once acknowledged and dealt with, ought to begin a new epoch in the planning of the larger Nonconformist churches. And the reason is this: Iron columns, when unprotected, are small, and cause little obstruction to sight. It has, therefore, been the custom, in multitudes of cases, to dot them down anywhere, without regard to architecture or design. Where there was a weight to be carried, the thing needed neither thought nor skill. It was only the putting of an iron column underneath it,

* All rights reserved.

* This fact, now well known to architects, was perhaps never better illustrated than in the burning-down of the Surrey Music Hall—a structure holding over 6,000 persons—some eighteen years ago. The author happened to pass it immediately before the fire broke out, when there were no signs of danger. On re-passing it an hour afterwards it was scarcely recognisable. The lofty roof and all the galleries had fallen in and disappeared. Only the walls remained, inclosing a sea of flames, out or which here and there some of the iron columns still protruded, bent and twisted into all sorts of fantastic shapes. Fortunately the building was empty, and no lives were lost.

and this haphazard way of getting over difficulties has been fatal to art. But if iron columns have to be encased in concrete or terracotta, they are no longer the trifling obstacles they were. Their position henceforth will have to be seriously thought about and skilfully arranged for, unless they are to be as ruinous to convenience in future as they have been to architecture in the past. And the result of this is, that in time to come we, or our successors, may hope to see in Nonconformist churches some ingenuity of arrangement, some beauty of general form, which, however unadorned, will be better than shapelessness disguised with finery.

(*c*) No other kind of construction, it need hardly be said, has such an air of permanence and impressiveness as that which is entirely in brick or stone. The only drawback is its comparative expense. It is possible, however, at little cost, to combine this with either of the previous types, and so to get some approach to a monumental character in a cheap interior mainly carried by wooden or encased iron columns. If the columns are of stone it is better to give a little study to the placing of them where they will not be inconvenient, than to fall back on the easy but unsatisfactory expedient of thinning them down. Some ways in which this may be done will be suggested in the next section.

Which of these three modes of building—*a*, *b*, and *c*—it may be best to adopt in a particular case will depend on the size of the church, and on the funds available. *a* is chiefly useful for small or only moderately-large structures; *b* for large ones; and *c*, if means will admit, for those of any size. But, obviously, cost does not depend entirely on materials and modes of construction. It depends greatly on general design, as well as on the sort and amount of decoration that may be introduced. On the type *c*, galleried churches are much more costly for the same amount of accommodation than ungalleried ones, and this is partially true, too, of those in the class *a*.

It is rather difficult to get exact information as to the building of Nonconformist churches. Some of the published statements give the cost of the church alone. Others include along with it in a lump sum the cost of Sunday schools and classrooms. Others, again, put in, either with or without the last items, the expense of lecture halls, caretakers' houses, and similar erections. The cost of the site, again, is sometimes included, and sometimes not included, in what is stated to have been the outlay on a church. And sometimes, to all the additions above-named, there are added the cost of the organ, the cost of carpeting and furnishing the minor apartments, and even, in certain cases, the expense of purchasing adjoining houses to improve the site. The grand total is then too often announced in a way which leads people to suppose that it is only the amount of the builder's contract. A striking instance of this occurred not long since, on the completion of one of the largest Nonconformist edifices in London. The outlay on the church in this case, with all its fittings and decorations, was about £20,000. A multitude of subsidiary buildings which adjoin it, cost nearly £12,000 more. But, in the published accounts circulated everywhere by the newspaper press, not only were these two items thrown into one, but all the different forms of outlay enumerated above, and a great many more, were added and included. The result was that a church which actually cost £20,000 was stated to have cost £50,000, and that most people suppose the latter sum, and not the former, to be the amount expended in building it.

It is clear that no useful comparisons are possible between statements of this loose and uncertain nature. A few examples, however, may be given from the author's own practice, showing the relative cost of different modes of building. In each case they include the actual outlay on building the church, with the necessary rooms or "vestries" for the minister and church officers, the cost of the pulpit and pewing, and that of warming and lighting. But they do not in any case include the cost of schools, classrooms, lecture halls, caretakers' houses, or other buildings; nor that of the site or its boundary fences; nor the cost of organs, or of carpets, and the furniture of rooms. The sums given, therefore, can in this case be compared with something like accuracy. They are not mere preliminary estimates; but, except in the cases otherwise stated, they give actual amounts laid out, including all extras.

Locality.	Number of sittings (for adults).	Cost of building.	Cost per sitting.	Cost in pence per foot cube	Remarks.
		£	£ s. d.		
Rye Hill, Newcastle	1,150	2,900	2 10 6	$3\frac{1}{6}$	Walls of stone, internal construction wood and iron.
Algernon-road, Lewisham, S.E.....	310	1,200	3 17 6	$5\frac{1}{3}$	Walls brick; stone and pressed brick dr tiled roofs; internal construction of boarded ceilings.
Urmston, near Manchester	350	1,650	4 14 4	5	Walls of Yorkshire parpoint stone dr stone turret and spire; no columns; ceilings.
New Barnet	300	1,160	3 17 4	$4\frac{1}{6}$	Brick walls; stone dressings; no columr
Dulwich Grove, S.E.....	570	3,529	6 3 10	$5\frac{2}{3}$	Brick walls; boarded ceilings; mould pressed brick; stone tracery; main a pressed brick; wooden columns to roof; brick and stone tiled turret.
Ditto, estimated cost, including future galleries and additional vestries	900	4,250	4 15 0	6	Ditto.
Poole-road, Bournemouth West	570	3,950	6 18 8	$4\frac{9}{10}$	Ditto, but with ladies' workroom, and brick and stone ventilating turret; ro
Ditto, estimated cost, including future galleries	800	4,400	5 10 0	$5\frac{3}{8}$	Ditto.
Bourton-on-the-Water..	320	1,800	5 12 6	$5\frac{1}{3}$	Rubble walls; stone piers and tracer lining; main arches of moulded presse boarded ceilings.
Westgate-road, Newcastle	850	5,236	6 3 4	$5\frac{1}{3}$	Stone walls with stone tracery and stc and arches; roofs of green Westmorla boarded ceilings; stone turret and marble baptistery and stone pulpit.
Jesmond, Newcastle (when end gallery is fitted up)	550	5,300	9 12 9	$7\frac{3}{8}$	Stone walls with stone nave piers and arches; roofs carried by cross arches central tower; stone pulpit; marble tery, and marble paving around covered with green Westmorland boarded ceilings.

It appears from these few examples (to which a great many more might have been added) that churches of the class *a* can be erected at a cost of £3 to £4 per sitting, and in some cases at a still lower rate. Those of the class *c* cost from £5 10s. upwards, and those of the mixed class, having main arches of brick or stone and the subordinate construction of the type *a*, from £4 10s. upwards.

It is also evident that it is not the most economical system, as regards first outlay, to build a structure lofty enough for galleries and not for the present to put them in. To do this increases the first cost by £1 per sitting, or sometimes more, though it is true that when this has once been done a large addition to the number of sittings can subsequently be made at very little expense. It is often desired to provide for the possible need of increased accommodation at some future time. Commonly there are two alternative ways of doing this—either by putting up a large building and afterwards inserting galleries, should this ever be necessary, or by putting up a smaller one and providing for its possible enlargement. The first way throws nearly the whole cost on the original congregation; the second way makes the original congregation pay only for what they require, leaving the later and enlarged congregation to do the same. The church on the second system is cheaper to build at first; but the sittings subsequently added will be obtained at a rate not much below that of the original ones.

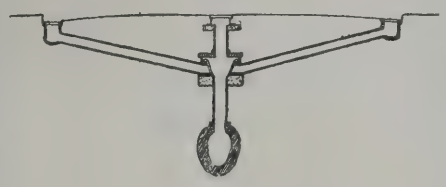
A third plan has sometimes been adopted, which may occasionally combine the advantages of the other two. When a Sunday school is needed at the same time as a church, the latter building may be made large enough to contain both, and the two may be separated by a temporary wall. Then, when more sittings are needed, this wall is taken down, and the school sect thrown into the church, a separate bui being at the same time provided fo scholars. If, instead of a Sunday sch lecture hall is required, in addition t church, this plan is still more feasib separate lecture hall being built whe space occupied by the temporary c needed in the main building. Or, a classrooms for adult classes may be ob in a similar way.

Approximate estimates of cost are monly obtained by "cubing up" a bu from the plans—that is, by ascert how many cube feet it would cons supposing it to be solid. For this p it is usually measured from the bot the brick, or stone, footings upwarc the average height, in feet, is then mu by the length and width of the build feet. Where there is a spare roo straight sides, the average height building, or, more accurately speak that part of it which is so roofed, wi be measured from the bottom of t footings to a point half-way up the rc the building is irregular on plan, or of different parts roofed at different each part must, of course, be cu separately, and the various amounts together.

The same list of buildings which h given above to show their cost per sitt gives their cost per cube foot. To j this correctly before a building h erected, is, of course, one great diffi obtaining a trustworthy estimate by Where a small building and a lar contain exactly the same kind of wc smaller building is pretty sure to co per foot cube than the larger one, *in proportion to its contents*, it require wall and more roof. Prices also var with locality, and, as everyone fluctuate from time to time.

A SUGGESTION FOR PAVED

A CONSIDERABLE saving of in the matter of emptying gulleys might be made where the roa paved, either with stone or wood. T means do not apply to macadam broken-stone roads, but where the rc are paved the mud washed into the by the side of the footways in heavy of a different character to that fro surfaces. In macadamised roads the gritty and heavy, and it is theref



isable to let it get so far as the street ers, and it is caught at the sides of the l in catchpits beneath the gulley gratings. se are emptied in the street, the mud ıg got out of the catchpits with much our and trouble with scrapers, scoops, shovels, and filled into mud-carts, which brought to the place and stand there to illed, passing on from gulley to gulley. he heavy road detritus were to be allowed e washed into the sewers, it would lie there be a serious obstruction to the flow of proper sewage; it is too heavy to be oved by any but the strongest current in d times, and even then a single flood does carry it far towards the outfall, on ount of its slow movement along the tom of the sewer. Of course, something ends on the gradient in all cases, and the distance to the outfall in some; but general thing, a great portion of it lies the bottom of the sewer if once it is itted. Hence the catchpits and the otying by manual labour on the surface. in paved streets the case is different. mud washed into the gulleys is lighter, consists chiefly of horse-dung and other se organic matter of a light character, ch may be very well discharged at once the sewers without detriment to their per working; it is, in fact, merely sewage, ost as offensive as the house sewage lf, and should on that account be got rid nce for all as quickly as possible, by ıg carried down to the sewage outfall. ere there is a full supply of water to the ses, say, of 20 or 25 gallons per day per d of the population, there is always water ugh running in the sewers to carry this ıt mud along to the outfall, unless it be he extreme upper ends of branch sewers, here the flushing tanks effect what the ular water supply cannot do.

What is called the ventilation of sewers always been a difficulty. If the current air were to pass at all times in one ction, the difficulty would be much ened, if not wholly done away with; but direction of the air current is in some ree influenced by the direction of the d over the surface, and although the er air may at most times pass in one ction, it occasionally takes a contrary one. re is, however, so much inconvenience in wing it to pass from the sewers upwards ugh the street gulleys close to the foot- rs, that these are nearly always trapped prevent its escape there. Seeing, how- r, that the formation of foul air from age cannot be prevented, it is allowed to ape by vertical pipes covered by iron tings in the middle of the roadways, being less objectionable than escaping ugh the gulleys at the sides.

Proper ventilation, however, consists of a vision of special pipes carried up the se walls, and terminating above the s, in which case these vertical pipes in middle of the roadway become inlets of h air, which carries with it the foul air he sewers through the proper ventilating s provided as mentioned. Those ventila- in the middle of roadways sometimes sist of brick manhole shafts instead of es; but in either case their use in a per system of ventilation is to admit h air to the sewers, notwithstanding occasionally the sewer air may escape wards through them. When these happen be opposite the situation of the street leys, the gulley-pipes form branches n them; but more often, perhaps, the ley-pipes are carried into the sewers pendently, a vertical pipe being brought rom an oblique junction formed with the er.

n paved roads, if the washings of the face be allowed to run into the sewers n the side gulleys, the trap to the gulley- would be better at the junction with vertical-pipe (as shown in Fig. 1) than in the gulley itself, and a valve-trap there would be better than the ordinary overflow-trap at the gulley. The valve-box may be either of earthenware or iron, the iron door being planed in a lathe and faced with leather, and it will be practically air-tight, and prevent any foul air from the sewer passing up the branch-pipe to the gulley.

FIG. 1

If the outlet-pipe from the gulley be made 6in. in diameter, and the fall to the centre of the roadway 1 in 20, the heaviest rainfall would not fill it more than half full. Taking the gulleys on each side of the street to be 300ft. apart (which is more than the average), and half the width of the roadway to be 20ft., there would be 6,000sq.ft. of surface washed into each gulley. A rainfall of 2in. in an hour would average 1-30in. per minute; but during some minutes it might fall at twice the average rate, or 1-15in. per minute, in which case the quantity to be discharged by the pipe would be about 33c.ft. per minute. A 6in. pipe running half full with an inclination of 1 in 20 would convey 40c.ft. per minute. Therefore the valve-box at the lower end of each branch pipe from a gulley need not be laid at any great depth below the surface of the street, and may, when occasion requires, be reached from the surface. In the case of new streets which have been but recently laid out and not yet paved, although for convenience sake the sewer may have been laid down, the gulley grating cannot yet be fixed, and the arrangement above described will remain incomplete for a time, in which case a temporary catchpit may be made on

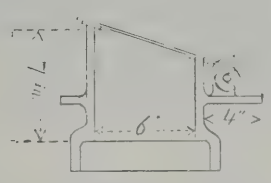


FIG. 2.

the upper side of each gulley, to be filled up when the street is paved. The gulley in this case would be covered with a 4in. flagstone, and the grating set over the temporary catchpit. The water from the road surface would flow through an opening in the side of the temporary catchpit into the gulley during the time the street might remain unpaved.

Fig. 2 would be a convenient form of valve-box if made in earthenware. C. S.

THE SOCIETY OF ARCHITECTS IN BELGIUM.—III.

WEDNESDAY in last week was devoted to a trip to Audenarde, and a most valuable day it proved, for the Hôtel de Ville, though the only building of exceptional interest in the town, is far the finest in Belgium both in position and design, nobly designed in rich yet dignified Late Gothic (1526—36), simply grouped in two flanks to a central tower having a small open-traceried crown, facing a magnificent open square, and with a stepped gable at either end. Within, the most noticeable feature is the Renaissance carved-wood entrance-screen and door to the council chamber, carved by Paul van der Scheldur, a native artist, in 1537, with the carving of its panels deeply undercut—a manly specimen of carving, displaying all a strong man's strength and gentleness combined. In this council chamber the Bourgmestre, M. Paul Raephsaet, welcomed his guests warmly, as did also his senior échevin, M. Edouard van Comwenberghe, who proved to be an excellent guide for the remainder of the day. In the front hall of the building the most noticeable feature was the manner in which the hearths of the rooms above were supported—by excellent groined vaulting; but the building possesses a second and larger hall in the rear, dating from the 11th century, with window openings skew on plan, so as to prevent the sunlight from ever penetrating, and with a noble timber roof having the apparently usual feature of a cut principal rafter, to allow of the collar being carried through, a lighter principal rising above the collar, which supports huge coupled purlins.

After the inspection of the Hôtel de Ville lunch was partaken of, and then a visit was paid to the Bourgmestre at his private house, to see a 16th century chimney-piece, and a reproduction of the door to the council chamber in the Hôtel de Ville, of which the panels are in cast bronze, well executed; and the tourists were informed that twenty of them are to be obtained at 50f. each on application. The two churches of the town were subsequently seen, that of Notre Dame de Pamell being a well restored 13th century edifice, with octagon tower over the crossing, and in the S. transept a long narrow lancet window carried right through the triforium, which it breaks. It has also an external gallery, like that to St. Jacques, Tournai. The church of St. Walburga, besides its lofty 14th century tower, now capped insignificantly since the spire was destroyed by lightning in 1803, is mainly interesting as showing what that of Notre Dame was like before M. von Assehe's restoration; for it is a Romanesque church, with all the voids filled in with brick and the projectious cut away to allow of the introduction, early in this century, of ill-designed plaster Renaissance decoration, whose designer was feasted royally on the completion of his work of vandalism. However, enough money has been raised for the proper restoration of the choir, which is to be commenced soon.

Courtrai, on Thursday, proved, in spite of appearing at first sight to contain little of interest, to be a most satisfactory town to visit, the rich colouring of the old houses, particularly those in the Béguinage, or Nunnery, of St. Elizabeth, and the picturesque tower to the old hall, rising above a block of modern buildings. The first official visit of the day was that to the Hôtel de Ville, where the members were received by the Bourgmestre. The exterior is extremely simple, almost meagre when compared with the other similar buildings seen already; but within it was a pleasant surprise to find two magnificent chimneypieces, Late Flamboyant in style, with Moorish, or, rather, Spanish, feeling displayed in the festooned cusping. They were erected in 1520, and have never been restored, though the room in which the better one stands has been recently decorated to harmonise with it, the walls being lined with fresco paintings by Swerts, Giffens, and Janssen, representing scenes in the history of the town—the departure of Baldwin of Flanders for the first crusade, and the swearing in of the citizens before the "Battle of the Spurs," a dark corner being most cleverly treated to show the detail as clearly as if the brightest light fell on it. The picturesque Watergate, with its museum, and the churches of Notre Dame and St. Martin were visited later in the day, but they possess little which is worthy of record in an architectural paper.

Friday, the last day of the excursion, was spent at Yves, and there the Bourgmestre, Baron Surmont de Vols Cerghe, received his visitors in the morning, conducting them over the great Cloth Hall, with its monotonous façade and bold central tower, which, begun in 1285, was finished in 1304, though the roof is of the 15th century. This is of the usual Belgian type, described already, but is of lighter appearance than are the earlier roofs, and covers a large ⊔-shaped chamber, of which the longer area alone is 460ft. by 38ft.—a truly magnificent apartment. Beneath its shorter area is the butter market, with a central row of rough and slightly-proportioned stone columns to support the timber floor above; but beneath the rest is the vegetable market, with brick-vaulted roof, into which cross vaults cut awkwardly from the eccentrically-placed windows. A few good details were seen in the museum close by; but many members

spent the afternoon in sketching the two or three quaint brick fronts which still exist in the town, more varied and more beautiful in their tracery than any seen during the whole fortnight, while an official visit was paid to the church of St. Martin, once the cathedral, a well-proportioned building, but uninteresting compared with others in the country. In the afternoon the members left for Ostend to return to England on Saturday, with a general feeling of architectural repletion, and of thankfulness for the kindness and hospitality which they have met with everywhere, as well from the officials of the smallest churches and town halls as from His Majesty the King of the Belgians, whose kindness in granting them an initial audience they will not readily forget. They carry away with them, though, a remembrance of rivers converted into open sewers, and of an absence of provision for the disposal of sewage, the cesspool and midden being general, which is by no means creditable to their Belgian friends.

HOT-WATER ENGINEERING.—XIII.

SUPPLY OF HOT WATER FOR BATHS AND DOMESTIC PURPOSES.

CONVERSION OF TANK TO CYLINDER SYSTEM.

IN undertaking this conversion, the chief expense, so far as materials are concerned, is the cylinder. Very little besides this is required. The existing services of the tank apparatus can be wholly utilised, and these without being disturbed, except at the upper and lower extremities. There are practically three ways of

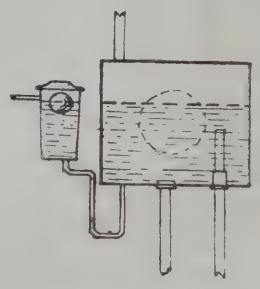

FIG. 40

doing this: one by totally displacing the tank, one by partially disconnecting it, and the other by letting it remain untouched, provided its size is suitable. The insertion of a cylinder at the customary position is, of course, necessary in any case.

Commencing with the latter method first, the reader is referred to Fig. 35 in the last paper, which, although described in another way, is practically a tank apparatus, with a cylinder inserted below. There is, however, one important thing in this latter arrangement which must not be overlooked. When an apparatus is newly erected with two reservoirs, as Fig. 35 just referred to, every care is taken that they be of correct size; that is, the two reservoirs together must be only of a size equal to one reservoir of an ordinary apparatus. Now if we attempt to insert a cylinder in at a low point of an existing tank apparatus as just suggested, it may be supposed that the existing tank will be of normal full size, and, therefore, the cylinder will increase the total reservoir capacity so as to lessen, or probably destroy, the efficiency of the apparatus. If the existing tank was 50 gallons, and this was the full and proper size for the boiler, then to add a 25-gallon cylinder would raise the reservoir water to 75 gallons, which is as much as should ever be put to the very largest range boiler.

It therefore follows that if it is proposed to convert a tank apparatus to the cylinder system by the insertion of a cylinder below, and the non-displacement of the tank, one of two things must transpire: either it must be found that the existing tank is fully small for the boiler, and will bear the addition of a second small sized reservoir; or it must be that a new range or boiler is about to be supplied of a larger or more efficient character, which will successfully cope with the old apparatus, together with the new reservoir. Of course, the amount of water in the existing tank ould be reduced (which would practically reduce its capacity) by putting a supply cistern at its side at a height to prevent its filling more than half or two-thirds full, as Fig. 40. This introduces the objectionable intermediate cistern and its ball-valve; but it is the only means we have of reducing and limiting the quantity of water in this upper reservoir, and by so doing

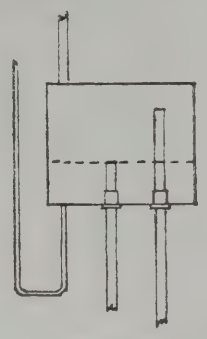

FIG. 41.

of permitting the insertion of the cylinder below under ordinary circumstances. In this case the termination of the flow-pipe in the tank would have to be lower, that is, about 4in. below the water level, instead of close up to the top.

Occasionally it is contended that the actual capacity of a tank can be reduced by permitting it to fill full up as usual, but terminating the *return* up towards the middle of the tank, as Fig. 41—one-fourth the way up if the tank is to be reduced one-fourth, or one-third the way up if one-third reduction, and so on. It is suggested that as the point at which the return terminates in the tank is the lowest point at which the water circulates, all water below the termination (or it would be more proper to call it the commencement) of the return is stagnant, and may be ignored the same as if a false bottom was carried across at this point. The dotted line in the illustration is this imaginary limit between active and stagnant water, the latter being looked upon as water quite inactive in every way, and to all intents and purposes absent. This supposed state of affairs is incorrect, not wholly so, but sufficiently to render the results less efficient than anticipated. The water below the dotted line does not remain stagnant, and it robs the warm water above of heat to a material extent. It is better to adopt the method shown at Fig. 222, when such is needed.

To convert a tank apparatus to the cylinder system, with the entire removal of the tank, the

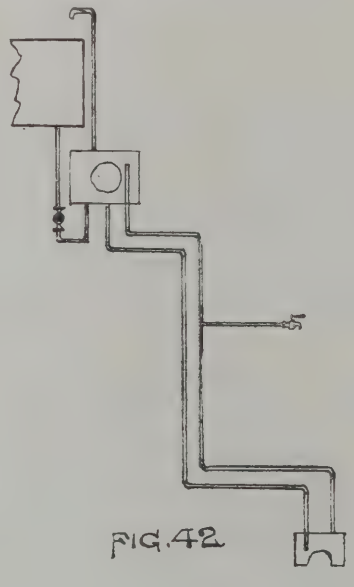

FIG. 42.

cylinder is inserted at the usual point, and in the usual manner already described; but in this case the cylinder must be of full size, having no auxiliary reservoir, as in the method just described. If the displaced tank was of good and sufficient strength, there would be no need to provide a cylinder, for, as explained in the Cylinder System (Paper VI.), a tank will an as a reservoir in the cylinder system just as as a cylinder, provided it is strong enou bear the pressure, the square shape of the being much weaker than the cylindrical sh In this case the expense would be for la only, except one or two new fittings and nections that might be required.

Fig. 42 shows a tank apparatus of a si and ordinary character, and Fig. 43 show same apparatus converted. The original and return have to be cut at the point whe cylinder is intended to come, and are conn up in the usual way, as shown. The rema of the flow and return pipes above the cyl (after the tank is removed) are converted i rising main service and a cold supply pip spectively. The original flow-pipe answer the former, having its lower extremity nected into the top of the cylinder, and a top it is joined on to the original expansion of the tank, as shown. This pipe is now pleted as a single-pipe rising main; if a ret needed to it, then one of the different me explained in Paper VIII. must be adopted is not necessary to repeat the information he

The original return is converted into a supply service, being joined to the origina service at the top, as shown, and carried in bottom of the cylinder at the lower extre

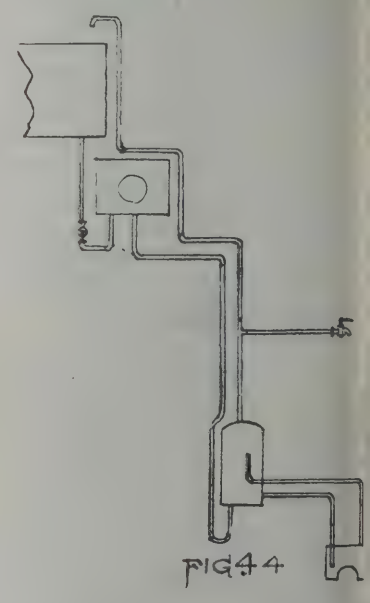

FIG 44

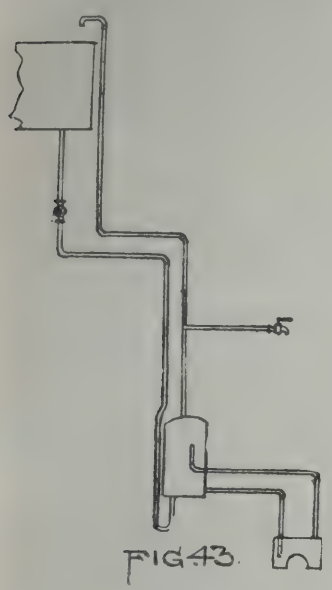
This leaves the stop-cock situated up at the the house, which is contrary to the sugg made when treating the cylinder syste could be readily removed and re-fixed at point if desired. This is the most usual n of conversion, and simple, but not so simp inexpensive as the next method about described, if the tank can be left and required for any other purpose.

In the method of conversion that wa scribed as with partial disconnection of the it is arranged for the tank to remain original position, and act as an auxiliary water cistern. Fig. 44 shows this metho will be seen that, as in the last method (Fi the original flow and return are cut, ar cylinder inserted in the usual positio connected up in the customary way. The part of the original flow is converted into a rising main, being connected to the top cylinder at its lower extremity, and joined original expansion pipe at the top. Thus conversion is carried out in precisely the manner as the last apparatus. Now, ins removing the tank, it is left undisturbed af flow and expansion pipes have been remove the holes stopped. It remains, as the ill tion shows, with the cold-supply pipe l into it, and the original return leading fr but this latter pipe has now to be consider cold-supply service, and its lower extrem carried into the bottom of the cylinder.

In this case it would be more desirabl ever to put the stop-cock just beneat cylinder; otherwise, when cleaning or have to be done, the contents of the tank, as the cylinder, will have to be withdraw course, the only reason for limiting as m

isible the amount of water to be withdrawn is effect a saving in time and trouble. It some-ies proves an awkward and tedious job empty out this quantity of water, par-ularly if the tap be a small size and in-veniently situated. If the tap was over ink, the task would be simple, and a little ra water could be disposed of easily. It never ms the correct thing to waste a bulk of water, l, of course, such a waste cannot be tolerated country residences where the supply is nped, and perhaps limited as to quantity. This last method of conversion only provides a gle rising main service, the same as the vious one explained. If it has to be returned, n a new service must be run down to the inder, entering it at a high point, as previously ntioned. It will have been noticed that



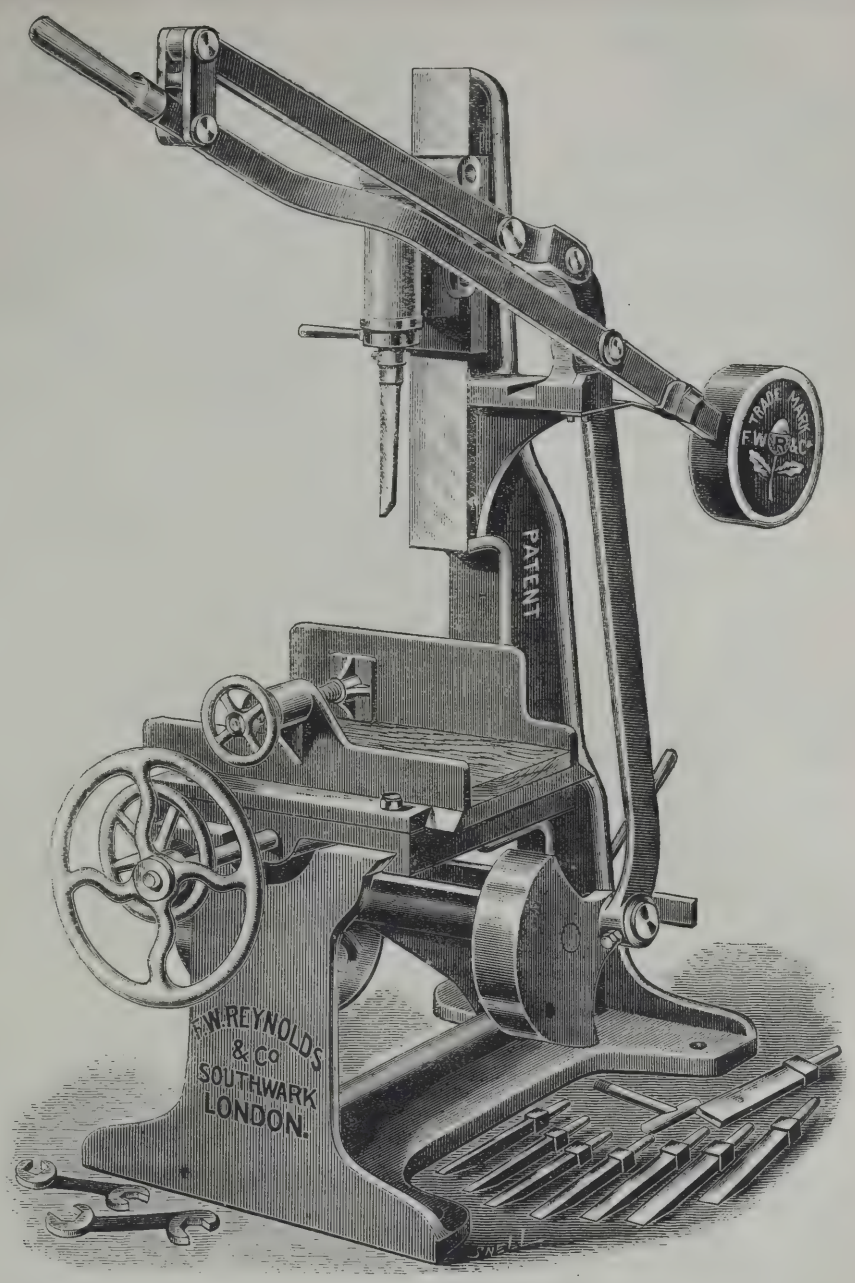


FIG 43.

less for some special convenience), no draw-services need be interfered with, for the flow-e to which they were all connected is con-ed into a rising main service, and this latter he correct pipe for the draw-offs to be ched to in the cylinder system.

AMERICAN ENGINEERING.

A FEW instructive papers appear in the *Transactions* of the American Society of il Engineers. The report of the committee the cause of the failure of the South Fork n is a lengthy report, illustrated by several tes taken from photographs, showing the eck of the bridge of the Pennsylvania Rail-l over the Juniata river, Lewistown, and the roundings of the broken dam which caused so ch havoc and loss of life. The report asserts t the dam itself was well and thoroughly lt, and would have resisted the pressure of er, and that the failure was due to the dequate wasteway and the great flood. The lway had not a sufficient discharging acity, "contrary to the original specification Mr. W. E. Morris, which required a width of rflow of 150ft., and a depth of 10ft. below t; it had only an effective width of 70ft., a depth of 8ft. The accumulated water rose uch a height as to overflow the crest of the n, and caused it to collapse by washing it vn from the top." Such a rainfall had not en place since the construction. The rise of water was about 30ft., and the flood ried away in its furious progress all the dges between South Fork and Johnstown, the embankments, and caused a fearful of human life and the destruction of vate property amounting to millions of dollars. e report and data furnished are of value. The endix gives estimates of the discharge ough the wasteway and sluice pipes. The ort is signed by James B. Francis, W. E. rthen, M. J. Becker, and A. F. Feley. The ult of the dire catastrophe, unexampled in nt times, should be a warning to engineers companies to take into account excessive ds by providing waste channels of sufficient size to meet such emergencies. The next paper, by J. Foster Crowell, is on the Ravine du Sud, in the Island of Hayti, and a plan for averting its overthrow. The methods of bank protection proposed are shown by plans and sections. The "Nozzle as an Accurate Water-Meter," by John R. Freeman, "The False Ellipse reduced by Equations of Condition," by Arthur S. C. Würtele, are other papers. Those who are interested in hydraulic works will find the June number of the *Transactions* instructive reading.

AN IMPROVED HAND AND POWER MORTISING MACHINE.

A VERY useful form of mortising machine has been patented by Messrs. F. W. Reynolds and Co., engineers, of the Acorn Works, Edward-street, Blackfriars-road, which has the great advantage of being worked either by hand or driven by power. We have seen the machine in operation when driven by belt from an engine. By a double-link arrangement of levers, the requisite vertical motion is obtained in a very simple and direct manner. The connecting-rod attached to crank-shaft actuates the rocking-bar carrying the chisel-holder, which thus works in its guides without touching the wood. To bring the chisel into action, the hand-lever is brought down to the work and simply held still by the right hand, the left hand being applied to the hand-wheel to move the work along the sliding bed. No exertion is required in this operation while the motive power is used, and it is stated that when thus driven the machine will turn out four or five times more work than can be done with the ordinary hand-mortising machine. But the value of Messrs. Reynolds and Co.'s machine is that in small joinery works it can be made available for either power, and especially in workshops where the motive power is not in constant use. This can be done by simply inserting a T-screw into one of the two holes in the counterbalance of the crank. The hand lever is then brought down to its work, and the mortise manipulated in the ordinary manner. Thus the machine is of far more value than if worked singly by hand or by power, and its cost, complete with six chisels, is only nineteen guineas. It is fitted with fast and loose driving pulleys, and striking gear for belt. A boring apparatus with three augers can be fitted, if desired, to the chisel holder, and we can confidently recommend the machine to the attention of all builders, joiners, and contractors, who will find it one of the most useful machines for power-mortising, capable of making a mortise 11in. deep, and taking stuff $4\frac{3}{4}$in. wide.

Marlborough-square Chapel, South Kensington, has just been reopened. The building has been restored and decorated from the designs of Mr. Maurice B. Adams, F.R.I.B.A. The roofs have been renewed and the fabric repaired. The structural improvements were carried out by Mr. Warren Smith, of College-street, Fulham-road, and the other work has been executed by Messrs. Adamson and Sons. The trustees paid for the restoration, and Mr. C. J. Humphreys became responsible for the cost of the painting and decoration. The chapel was erected about forty years ago.

ILLUSTRATIONS.

ST. PAUL'S, FROM THE THAMES.—SALISBURY CATHEDRAL.—NO. XXIII. BERKELEY-SQUARE.—NEW BRIGHTON STATION.—DESIGNS FOR THE NEW SOUTH KENSINGTON MUSEUM BUILDINGS, BY MR. T. G. JACKSON AND MR. MERVYN MACARTNEY.—MADAM PATTI'S THEATRE AT CRAIG-Y-NOS CASTLE.—SOME OLD FRENCH FURNITURE.

Our Illustrations.

VIEWS OF ST. PAUL'S AND SALISBURY CATHEDRALS.

MR. PAUL DELARNE, of Paris, has lately brought out a series of clever etchings by Mr. Lucien Gautier, illustrative of the cathedrals and other historic buildings in this country,* and to-day we are enabled to present our readers with two reproductions representing these familiar examples of English architecture. St. Paul's from no point of view looks so grand and imposing as it does from over the river, with the waterside warehouses and wharfs grouping at its base, set off by busy craft and shipping, as shown in this picture. Salisbury is also represented by Mr. Gautier from the most favourite standpoint, looking across the water meads north-west of the cathedral. As contrasts, no more typical specimens of church building could be placed side by side, the one dominating with its grandeur of breadth the heart of the great city, the other rising with aspiring grace and exquisite elegance midst the quietude of a country town surrounded by trees and meadow pools. Among the other etchings issued in this capital series are views of Canterbury, Durham, Peterborough, Norwich, and York Cathedrals, the Tower of London, Westminster Abbey, and the Houses of Parliament, besides other equally satisfactory pictures from Italy and France, all drawn to uniform scale.

NO. XXIII. BERKELEY-SQUARE.

THIS house, which has been rebuilt upon the site occupied by a similar house to that on the left of the picture, is just nearing completion. It is faced with Portland stone and Bracknell rubber bricks, and has been carried out by Messrs. Prestige and Co., of Pimlico, from the designs of Messrs. J. T. Wimperis and Arber, architects, 25, Sackville-street, Piccadilly.

NEW BRIGHTON STATION.

THE elevations and plans of this station on the Seacombe, Hoylake, and Deeside Railway explain themselves. The architects were Messrs. Bell and Roper.

SOUTH KENSINGTON MUSEUM COMPETITION.

WE thus far complete to-day the illustration of each of the eight schemes submitted in this great competition by giving views and plans of the remaining two designs, which, although illustrated last, are by no means the least interesting of the series. Mr. T. G. Jackson, M.A., is the author of one, and Mr. Mervyn Macartney, M.A., of the other. The selected design, by Mr. Aston Webb, was published by us on August 7th and on the 14th, when we also gave Mr. Emerson's; on the 21st Mr. Collcutt's and Mr. Belcher's designs appeared, and last week we gave those by Messrs. William Young and Sir T. N. Deane and Son. We propose to continue our series by reproducing the more characteristic of the various interior views submitted.

* Paris: Paul Delarne, 5, Rue de l'Echelle. London: H. G. Lugard, 15, Percy-street, W.

THE PATTI THEATRE.

WE give the principal elevation and plan of Madame Patti's new theatre at Craig-y-Nos, recently inaugurated. Little need be said of the exterior, which has been kept purposely plain. The chief entrance is not from the outside direct, but by way of the Castle, Madame Patti-Nicolini having in view primarily the entertainment of her guests. The movable floor of the auditorium is, perhaps, the most noticeable feature in the theatre. For theatrical purposes it inclines towards the stage; but it is capable of being raised to a level with the latter when desired, thus providing a ball-room of 62ft. in length at short notice. The auditorium holds 180 persons; the first few rows of chairs have arms, and are covered with blue silk plush. The rear of the building is curved, with a small gallery over for a few extra visitors. The orchestra is separated from the auditorium by a balustrade, and will hold a band of sixteen performers. It is sunk 6ft. below the stage level. The proscenium is 20ft. wide and 19ft. high, the stage being 24ft. deep and 40ft. wide. Behind the stage are five dressing-rooms. The lighting arrangements, which are by means of electroliers, are of an extensive and luxurious character. The total number of lights is 281, and all these are under the control of the prompter, who can, by switch arrangements, produce many striking effects from coloured lamps. The wall-surface of the theatre is divided into panels by Corinthian columns, and is crowned by a coved ceiling. The architects are Messrs. Jennings and Bucknall, of Swansea and London. The builder was Mr. H. Smith, of Kidderminster. The plaster work was done by Messrs. Jackson and Sons, of London, and the decorations by Mr. Jas. Casas; while the electric lighting has been carried out by the Wenham Light Company.

OLD FRENCH FURNITURE.

ONE of the most important sales of the season in the way of valuable furniture was that of the late Right Hon. Cavendish-Bentinck's collection at Christie's. The high prices realised show the great estimation in which genuine French cabinet-work is held, though we fear these fine examples are fast drifting out of this country into the homes of American millionaires. The oval Marqueterie Table in the accompanying illustration is fitted up with writing-slide and drawers, and inlaid with flowers in coloured woods. It is the work of David de Luneville, a contemporary of Riesener. The well-designed Bonheur de Jour Writing Table, a marvel of elegance and dainty workmanship, contains the usual writing slide and drawer, and in addition two cupboards above. It is richly inlaid with vases of flowers, books, music, and utensils, and is mounted with chased ormolu work. The fine Louis XVI. Commode is divided into two large drawers below, with smaller ones above. It is inlaid with wreaths of foliage, and the centre contains the letter H. The friezes and other ornaments are in chased ormolu. The whole is surmounted by a marble slab. It is 3ft. 5in. in length, and is signed "Fait par George Hougot Eben du Roi à Stockholm l'an 1776."

The Caledonian Railway Company has let the contract for the construction of a new branch from Edinburgh to Barnton. The line will be two miles five furlongs in length, and commences at Craigleith Station, branching off from the Granton line in a north-westerly direction. The line will require some ten bridges, and will present no great engineering difficulties. It will take about a year to construct.

An addition has just been made to the series of stained-glass windows in Truro Cathedral. The window—a memorial—is in the north aisle of the choir, and the subject forms another link in the series planned to illustrate the history of the Church. The principal figure is that of St. Ambrose, clothed in Episcopal vestments and mitre, and holding in his hand the scourge of discipline. On either side of him are seated St. Monica and her son, St. Augustine, the latter being vested as a bishop. Below is shown the Emperor Theodosius, doing penance before St. Ambrose, the great Bishop of Milan.

COMPETITIONS.

GLASGOW.—The executive of the Associat for the Promotion of Music and Art in Glasg have completed the arrangements for the first preliminary competition for designs from arc tects for the new Art and Music Galleries Kelvingrove Park. When issued, the instr tions to competing architects will stipulate the limitation of the cost of the structure £120,000. The chief feature of the building be a central hall with a floorage of from 8,00 10,000 square feet, and there will also be su of art galleries for exhibition, lecture, and sch purposes, museum, mechanical workshop, administrative offices. In connection with preliminary competition, designs will requir be sent in by November, and after a short has been elected a final competition will t place, most probably in March next.

SOUTHAMPTON.—Thirty-seven designs h been received for the public library at Southa ton. The award will be made next Mond after which the designs will be on public vi Mr. W. Henman is the professional referee.

CHIPS.

Mr. Francis Parr, late assistant to Mr. Ar Thorne, architect, of Barnstaple, has been appoi surveyor to the town council of Bridgwater. T were 130 applicants for the post.

The parish church of St. Edith's, Grimoldby, been reopened after internal restoration. The Mr. Ernest W. Farebrother, F.R.I.B.A., prep the plans, and the work has been carried ou Mr. H. Marrows, contractor, Grimsby, under supervision of Mr. H. C. Scaping, archi Grimsby. The seats are of wainscot oak, P style. Most of the old carved tracery foun different parts of the church has been utilise the decoration of the screen and the base of pulpit.

A new Wesleyan infants' school is being ere at Leyland, memorial-stones of which were lai the 22nd ult. Mr. T. Jackson and Mr. A. Ton son, of Leyland, are the contractors, and Mr Hugill Dinsley, of Chorley, is the architect.

The last excursion of the present session of Archæological Section of the Birmingham and land Institute took place on Saturday, when members visited the Doveridge Mill and Chu Somersal Herbert Hall (a fine old half-timb house), Somersal Herbert Church, Sudbury Ha Jacobean mansion) and Church.

On Wednesday week the corner-stone of a wing to be added to the Boscombe Hospital laid. The buildings are being erected by M Walden, of Bournemouth, at a cost of £350.

The foundation-stone of a Masonic hall wa at Budleigh Salterton on Wednesday week. shipful Brother W. H. Stichland is the hon. a tect, and Brother Hayman the builder.

At a meeting of the Nairnshire County Co on Friday the appointment of road surveyo sanitary inspector was made. There were 50 a cants, and Mr. David M'Kenzie, Biggleswade, fordshire, was unanimously appointed.

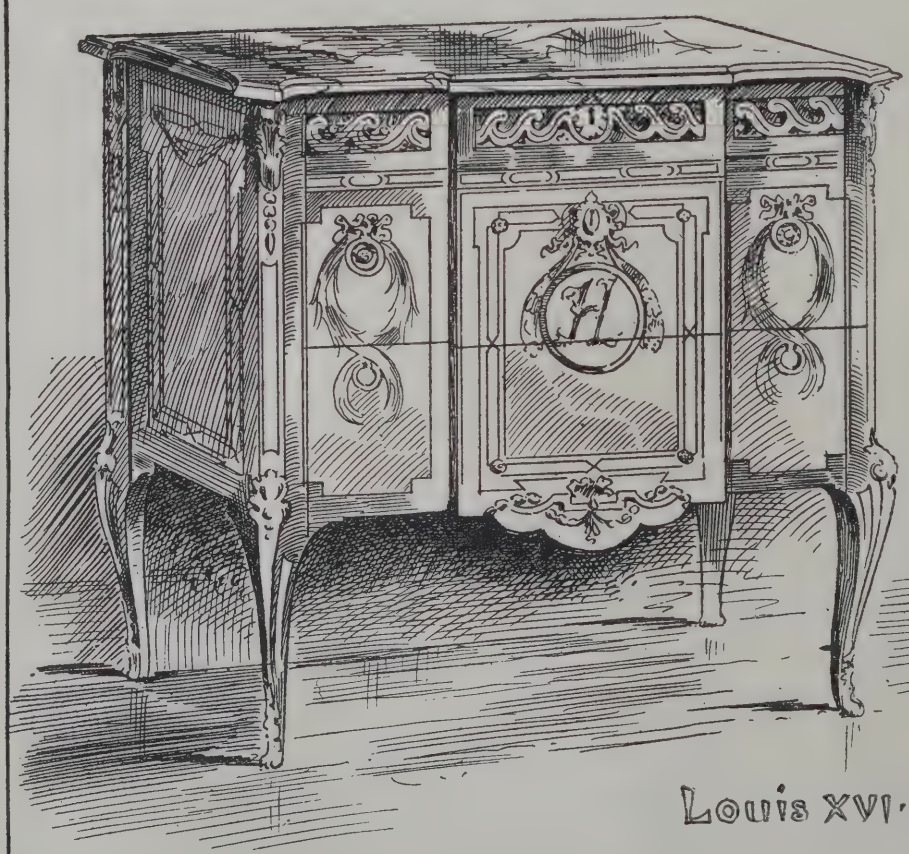
The statue of the late James White, of Over unveiled in Cathedral-square, Glasgow, is of br and stands on a pedestal of Aberdeen granite. statue was begun by the late John Mossman has been completed by Mr. Frank Leslie.

The Duchess of Albany will open the new b ings forming the extension of the Printers' A houses, at Wood Green, in October.

It is definitely arranged that Captain Shaw take leave of the Metropolitan Fire Brigade o 1st of November next.

The collection of Trojan antiquities beque by the late Dr. Schliemann to the City of Berli been packed in Athens, preparatory to despatch to Berlin. They fill fifty large cases.

Memorial stones of a new Primitive Meth chapel were laid on the 15th ult. at Standish. T. Crook, of Chorley, is the builder, and M Hugill Dinsley, of Chorley, is the architect.



Messrs. Whitaker Bros., Limited, of Hors the contractors for the widening of the Northern Railway between Bramley and Wo near Leeds, began the work on Monday. company have allowed two years for the pletion of the works, which include the p down and rebuilding of a number of bridg four lines instead of two, as at present, and widening according to the requirements Leeds Corporation, and also the construction second tunnel to run alongside the one alre existence at Armley. The cost is estimat between £70,000 and £80,000.

WAYSIDE NOTES.

TROLLING along along the beach from Deal in the direction of Sandwich, we come on the ruins of Sandown Castle, historically eresting, architectural, and picturesque withal, l, when I saw them some two years ago, erably defiant of the boisterous winter seas. sonry and other concrete constructions, how- r, have but a poor chance against wind and ves in the long-run, more particularly when ir repair is neglected; and wind and wave, it ears, are working havoc at Sandown. The ns of Sandown Castle, I read, are "rapidly appearing," and unless measures are taken to vent their destruction, there will presently be thing left of the old pile beyond the site and name. Some days ago over fifty tons of erhanging masonry fell on to the beach below, e foundations having been undermined by the tion of the tide. This neglect of Sandown stle is much to be regretted. It is not a chester or a Conway Castle; but it has its own e to tell in the several languages of art, chæology, and history, and forming an interest- g object to visitors to the district, and a lcome addition to the architectural relics of st Kent; it deserves to be protected by such may have authority over its venerable stones. at authority is apparently the War Office, ice, at a recent meeting of the Deal Town uncil, the councillors decided to call the tention of the department to the present con- tion of the ruins.

Some time back I alluded to the remarkable ins discovered at Zimbabye, in Mashonaland. rther information regarding these mysterious frican constructions comes to hand through a ivate letter received from a gentleman who s recently visited the ruins, interesting pas- ges from which have been published in the ilies. Mr. Theodore Bent, the writer of the tter, says of the round wall and tower, that It is a large phallus. The wall and tower e unique. The former is in some places 40ft. gh and 16ft. thick, and shows two periods of nstruction. Nothing was found in the temple cept recent Kaffir implements and pottery, hich show that the Kaffirs evidently entered to possession after the original people left, and at they removed every possible vestige of any evious race." Mr. Bent found no inscriptions the ruins; but thought it plain that the ople who built them were phallic-worshippers, phalli of all shapes and sizes have been un- rthed daily. Mr. Bent is now making dis- veries on the hill above the lower temple, here are even more interesting and wonderful ins of similar age, style, and construction. he finds already made comprise a small altar ith three phalli on it, enormous walls, narrow ssages, steps, arches, and walled-up caves, nd among the prizes unearthed are two huge owls, one with a splendid frieze portraying a nting scene, the group consisting of four aggas, with a hunter, who has discharged an row into the nearest quagga, and who is hold- g in one hand a hound in leash, while behind e hound are two elephants. Further dis- veries include some green Persian pottery and copper plate covered with gold. Evidently ese Zimbabye ruins are of no ordinary kind, d will prove most interesting, besides yielding any actual treasures of ancient art. We shall patiently wait some more complete account as the probable builders of the buildings now in ins, and of the nature and habits of the people their times.

The romance of the River Rhine, wails the *aturday*, has gone. Tell it not to "Goth"; ublish it not in the columns of the BUILDING EWS! For to the architect the castles of e Rhine, Rhinestein, the Drachenfels, and e Lorelei Rock, seem to be the very essence of mance in architecture—old German romance—type of romance as in this country we may look r in vain, finding nothing of an exactly corre- onding nature. What is the *Saturday's* com- aint? That the streams where the angler ight cast his flies for the lively trout or sluggish ayling, in the swift rush or swirl of the dark ill pool, are now poached or netted for the eighbouring pension or hydropathic establish- ent; and that the moss-grown mills "may obably" have given place to some many- pried structure, poisoning the water with leterious chemicals. In the once quiet Aar Valley the Apollinaris Company have created a busy industry, with fleets of shallow steamers. "The whole course of what used to be called the castled Rhine, now looks like the lower Thames, and smells like Shoreditch or Bermondsey . . . The steamer carries you through volumes of smoke, between a double line of cloth mills, chemical works, limekilns, and brickfields. . . . The spirited proprietors of these enterprises have been rapidly growing rich, and have . . . been trans- mogrifying and adding to venerable castles; they have been running-up sumptuous mansions of the florid Composite order in the suburbs of the cities, and one of the most audacious of the *nouveaux riches* has actually seated himself on the summit of the castled crag of the Drachen- fels."

There is a vast deal of satisfaction in explain- ing some point in a mystery that has not been cleared up in the public Press, and the cost is nominal unless one happens to unearth a "mare's nest." I may have found one now; but I will, nevertheless, make a suggestion as to the cause, or partial cause, of the recent railway accident at Ramsgate Station, L.C.D.Ry. It will be remembered that the train descending the sharp incline through the tunnel from Broad- stairs to Ramsgate was composed of Great Northern carriages. All who know this line are aware that the incline is really sharp and necessitates caution on the part of the driver of the train. Now, a train of L.C.D.R. carriages as against a train of Great Northern carriages, weight for weight—judging by the appearance of their build—cannot amount to the gross weight of the latter by, I should say, at the very least, 25 per cent. Consequently, a driver running down the hill through the tunnel and allowing brake-power sufficient for a train of carriages such as he is daily accustomed to drive, might find himself gaining an impetus beyond his power of control. This, of course, pre- supposes an inadvertence on the part of the driver—an excusable inadvertence, such as we are all liable to when placed in circumstances necessitating the adoption of measures which, by long contrary custom, we have not been used to.

One of the busiest scenes in London at the present time is the work at the new extension of Liverpool-street Station. I had a peep the other day of these operations from the elevated position of the North London Railway, and the bird's- eye view disclosed an extent of building opera- tions quite refreshing, at a slack season and an era of artisans' strikes.

The new Trans-Alpine Railway is to be com- menced shortly with a large capital and lengthy tunnel. The railway is to take about eight years for its construction and completion.

"A. A. Notes" to hand, and not a vast deal in it. Being an "off" season, one, perhaps, is not surprised or disappointed. The most pleasantly readable contribution will doubtless be the account of the excursion into Shropshire. "The premises question," says a note, "has been settled by taking temporary premises at 56, Great Marlborough-street, for the studio and classrooms"; and it is further stated that the committee have been fortunate in securing the assistance of first-rate lecturers and instructors. Professor Kerr will take some classes, and, moreover, returns his fees as a donation to the general fund! Mr. F. R. Farrow gives up his private classes to teach at the Association; Mr. R. Elsey Smith will lecture on the Orders and Classical ornament. The indefatigable Mr. R. W. Schultz takes the junior students in the studio, and Mr. J. A. Slater will take the senior students. Dr. Holmes, and Messrs. Moody and Hancock will be the chief instructors in the more scientific subjects.

A charming little vignette, by Mr. Herbert Railton, was published in the *Illustrated London News* last week. It represents the old houses in Fleet-street—just west of Fetter-lane—which, it is said, are to be pulled down. Architects should have a good look at them before they disappear. They are wonderfully picturesque, with their quaint Ionic pilasters and projecting balconies. The City authorities, who have compassed their destruction, don't seem to see the picturesque side of the question, and have ordered their early demolition.

Super lime-whiting extraordinary. The other morning the inhabitants of the village of Minster- in-Sheppey, near Sherness, awoke to find their windows and doors covered with whitewash. Two young cads — visitors — disappeared from the village that morning. If these practical jokers had been tarred-and-feathed, the incident would have been rendered still more humorous.

GOTH.

AN INCIDENT OF THE BUILDING TRADE STRIKE.

EVERYTHING has for some considerable time been ready for the reception of tenders for the erection of the New Admiralty Buildings in Whitehall, and the quantities were completed weeks ago; but in consequence of the strike in the building trade in London, the Government are unable to enter into any con- tracts for this great national work. The risk of doing so is considered so great as to warrant this delay, even although heavy rents necessarily are being paid by the Department for the accommo- dation of the staff, whose offices were demolished in Spring Gardens when the site was cleared years ago. The interest, too, on the large amount of money expended on the foundations of the new buildings carried out by Messrs. Mowlem last year must be also taken into con- sideration. Such a deadlock as this undoubtedly is of disadvantage all round, to the trade particularly, and to the public interest.

CHIPS.

A carpenter, named Hugh Smith, met with his death on Friday at the saw mills of Messrs. Dunlop Brothers, Belfast. Whilst Smith was working near a circular saw, the drum burst, and one of the pieces carried away the upper portion of his skull, causing instantaneous death.

Colonel John Ord Hasted, R.E., an inspector of the Local Government Board, held an inquiry at Radcliffe Colliery on Friday, the 28th ult., concern- ing the application made by the Alnwick Union rural sanitary authority for sanction to borrow £3,180 for works of water supply for the contri- butory places of Hauxley, Togston, and Warkworth, Northumberland, and received the evidence of persons interested in the matter. Mr. M. Temple Wilson, the surveyor to the authority, explained the plans.

A new hotel at Kingswood, near Bristol, was for- mally opened on Friday. It has been built for a limited liability company by Mr. J. James, of Stapleton-road, Bristol.

The Council of the Yorkshire College, Leeds, have unanimously appointed to the post of lecturer on sanitary engineering, Mr. William Spinks, A.M.I.C.E., of the firm of Spinks and Beever, civil engineers, Manchester and Warrington. The creation of the post is the outcome of a grant from the West Riding County Council, in aid of technical education, and in furtherance of the scheme it is intended to deliver a course of evening lectures in some of the largest towns of the West Riding. The appointment was open to public competition. Mr. Spinks was articled to the late Mr. R. Vawser, the borough surveyor of Warrington.

Campsie House Convalescent Home, Mussel- burgh, was reopened on Saturday, after alterations and enlargements carried out from designs by Mr. McLachlan, architect, of Edinburgh.

The ruins of Sandown Castle on the beach of Deal are rapidly disappearing, and unless prompt measures are taken, in a very short time all that will remain of the historic pile will be the site and the name. A few days ago an overhanging section, weighing over 50 tons, fell to the beach, the foundations having become undermined by the action of the tide, and at a meeting of the Deal Town Council on Monday evening it was decided to call the attention of the War Office authorities to the present condition of the ruins.

It is proposed to hold a great exhibition of rail- way plant and materials in St. Petersburg next year.

The recumbent marble statue of the late Emperor Frederick, which has been executed by Prof. Begas in Italy, and which is intended for the mausoleum of the Friedenskirche, Potsdam, is now finished, and will shortly be conveyed to Germany.

The members of the Architectural Association will pay a Saturday afternoon visit on the 26th inst. to Poles, Herts. This mansion, built for Mr. E. S. Hanbury, from the designs of Messrs. Ernest George and Peto, was illustrated in our issue of the 15th May last by a sketch from Mr. Ernest George's pen of the interior of the hall. Messrs. J. Simp- son and Son, of Paddington-street, W., were the builders.

HOW TREES ARE UNROLLED.

WE have lately heard a new manufacture vaguely referred to, in which wood is cut in a very curious way—a species of sawing, though no saw is visible—a cooper's shop, which contains everything save the staves. Recently a meeting of the Society of Industrial Engineers of Belgium at Merxem furnished the occasion for a visit to the little factory of Mr. Oncken. The object of the visit was to see the manufacture of casks in one piece. Given the trunk of a tree one mètre long by 40 centimètres in diameter, to cut or unroll it, not in numerous little planks of various sizes, but in one long plank or leaf a mètre wide and 10, 20, 50 mètres long, and without making any sawdust in the operation; in short, to cut out the whole interior of the trunk in a single sheet, and of extreme flexibility. The machine that carries out this invention is called the "Oncken Box and Barrel Machine."

The following is the method:—Gigantic poplars are sawn into portions of three-quarter or one mètre in length, according to the size of the machine that is to be used. These are then placed in immense boilers similar in shape to the boiler of a locomotive. The boiler being shut, water is then introduced, and is made to boil by means of a jet of steam thrown in by a tube communicating with the generator. The water is allowed to boil for two or three hours or more.

After the boiler is shut, electric wires in connection with a dynamo are fixed to the cover (the manufactory is lighted by electricity), and during the whole of the time the water is boiling it is thoroughly electrified. The chemical action thus produced, in combination with the prolonged boiling, gives to the wood the necessary softness, so that the knife may cut it without difficulty. The trunks are then stripped, and hoisted by the aid of a pulley. When opposite the cutting-tool, they are seized between two forks, and the machine is set in motion. The trunk is now scraping against a knife a mètre broad, and turning on its own axis with great rapidity. The machine now automatically advances, the knife descends and cuts a plank (or rather a sheet of soft wood) varying in thickness from one-fifth of a millimètre to fifteen millimètres, which then passes through a slot, and is taken by two workmen to the other end of the machine. The trunk turning very quickly, the men have as much as they can do to seize the continuous folds or sheets of wood as they fall through the slot.

The invention is a remarkable one. The sheets, or leaves (which can be made to attain fabulous lengths), are unrolled from a cylinder of wood barely able to produce planks of three to four decimètres in width. The sheet of wood thus obtained is then cut into lengths to make the small barrels, about 75 centimètres high, which are used for the carriage of fats, cement, colours, white lead, and powders of various kinds.

The sheet then passes between the rollers of a second machine, which cuts at one stroke a groove. This groove is intended to receive the bottoms of the barrels. A third tool seizes the sheet between two arms, and by the aid of knives cuts a series of mortises or slots round the sides. These slots, or mortises, when the sheet is made up into a barrel, give it the usual conical shape. A fourth tool rolls the sheet into a cylindrical form by means of iron grooves. Eventually the sheet reaches the cooper, who hoops it and renders it a perfect barrel. The machine will also cut wood into leaves or sheets for the manufacture of boxes. A very ingenious drying apparatus, which extracts all moisture from the barrels, and a second system of drying, which is operated by means of a ventilator worked by steam, renders the barrels fit and ready for exportation. The machine also cuts, after the same system, very thin sheets of cedar or other expensive woods, which are glued or pasted on to cheaper woods for the use of cabinet-makers. The present machine will only cut sheets three-quarters of a mètre wide, but there will be no delay in erecting a machine that will produce sheets of one mètre in width. A machine of the latter size has already been set up in Germany. Further particulars can be obtained, and samples of wood cut and veneered, also barrels made under these patents, together with a model of the wood-cutting machine, may be seen at the offices of the "Oncken" Patents Syndicate, 10, Old Jewry Chambers, London, E.C.

Engineering Notes.

NORTH BRITISH RAILWAY EXTENSIONS.—The new line of the North British Railway Company from Alloa to Kincardine is now about half finished, and is expected to be completed by next summer. The railway is a single line, about 4½ miles in length. It leaves the Stirling and Dunfermline line about 1¼ miles east of Alloa, passes close to Clackmannan, where there will be a station, by the village of Kennet, and close to the Forth Paper Mills at Kilhagie. It then continues southwards, passing near the ruins of Tulliallan Castle, and ends at the foreshore at Kincardine, where it was proposed to have a goods and passenger station, and also a pier. Messrs. J. Young and Sons, Edinburgh, are the contractors, and the total cost is expected to be about £60,000. The North British Railway Company are also renewing the railway viaduct over the Bilston Burn, near Dryden House, on the Loanhead branch. The five central piers are to be removed, and a single central steel span of 330ft., with side spans of 50ft. each, is to be substituted. Considerable progress has been already made in putting down the new foundations, and the staging to carry the steel work. The cost is likely to be between £15,000 and £16,000. Messrs. P. and W. M'Lellan (Limited), of Glasgow, are the contractors, and they have contracted with Messrs. J. W. and G. Stratton, Edinburgh, for the mason work of the new piers for £4,800. It is expected that the cost of contract No. 1 of the Waverley Station extension scheme, for the doubling of the line from Corstorphine to the Haymarket in Edinburgh will be about £20,000.

PORT OF NESS.—Plans have been prepared at the office of Messrs. D. and T. Stevenson, Edinburgh, for extensive alterations at the harbour of Port of Ness, Lewis. The existing basis was built six or seven years ago by the Fishery Board, at a cost of £6,000. The basin, built of concrete, at an angle in the coast, proved a great shelter; but, unfortunately, the entrance got silted up with sand a couple of years ago, so that boats could enter only at the top of the tide. The proposed alterations are being carried out on the lines of the suggestions of the West Highland Commissioners. It is proposed to close the existing entrance to the basin, which is a natural opening between two reefs standing out a short distance from the shore. The new entrance will be formed 200ft. to the east of the present entrance, and the reefs will be utilised in the formation of a breakwater, which will protect the narrow channel leading into the basin. The new entrance will have 3ft. of water at low tide. The most important part of the scheme, however, is the construction of a new breakwater of concrete, which will jut out in a southerly direction, immediately to the east of the new entrance, and will form a quay, to which steamers can be brought. It will run out upwards of 250ft. from land. It will be 35ft. wide at the base, and have a 20ft. roadway at the top. A parapet 10ft. thick and 8ft. high will run along the outer edge. Outside 30-ton concrete blocks will be piled along its length to protect it from the action of the waves, and inside it will be finished with a quay face. At its outer end there will be at low tide a depth of 15ft. of water. The improvements will include the cleaning out of the harbour basin and the making of a roadway from the village, which is just above the basin, to the new pier and breakwater. Under the West Highland scheme, £15,000 have been voted for the new works, and a further expenditure of £1,200 is in contemplation for minor alterations, to be carried out independently of the Commissioners' scheme.

Mr. Mann, late R.E., of New Brompton, has been appointed surveyor to the Hoo district highway board.

An architect and surveyor named Henry Metcalf, of Pendleton, died at the Horseshoe Hotel, Broad-street, Pendleton, under somewhat extraordinary circumstances. Mr. Metcalf, who was 58 years of age, visited the hotel on Saturday night, and went upstairs to the lavatory, which is connected with a slipper-bath. Some time afterwards he was found lying in the bath, fully dressed, and calling for help. Hot water was running into the bath, into which he seems to have fallen. Medical aid was summoned, but death ensued from the effects of the scalds and shock. At the inquest held on Tuesday a verdict of accidental death was returned.

Building Intelligence

BIRMINGHAM.—The alterations and decorat to the Town Hall, carried out at a cost of £10, £7,000 of which has been expended on struct improvements, are now on the eve of complet Messrs. Cossins and Peacock, of Birmingh were the architects, and the decorations have b carried out subject to their modification fro scheme submitted in competition by Mr. J. Taylor, of Five Ways, Birmingham. The tr ment is Roman, in harmony with the style of building. The prevailing hues in the u portion of the hall are maize yellow, with l and panels of terracotta, a considerable surfac cream or vellum, with the occasional relief tained from turquoise blue, and a very la employment of gold, both in lines and upon decorative mouldings. The walls beneath galleries are of Pompeian red, and the i columns of olive green. The base line of gallery front is of cream tint with a line of t quoise, and the vertical stiles cream, with terracotta panel. Between these the open ir work is of gold, which is shown against turqu wood panels in lieu of the red cloth forme used. The structural alterations include, at southern end, a new entrance hall from the stre measuring 15ft. across and 12ft. deep, with in offices on either side, a new staircase to the clos rooms in present basement, and others to gallery, a crush-room being provided in mezzanine space over the hall. At the opposi or northern, end, new stone staircases fr entrance lobby to orchestra, stone passage behi the organ, and two independent stone stairca from the peristyle to the roof. Messrs. Ha Son, and Peard supplied the pierced iron gratin which are of a partly decorative character. T contract for the general structural work w taken by Messrs. W. and J. Webb, of B mingham.

CANTON, CARDIFF.—Memorial stones of We leyan Sunday-schools were laid in Conway-roa Canton, on Wednesday week. The ne premises give accommodation in the main buil ing, on the ground floor, and in the galleries, t about 700 children, and when the class-roo are thrown open, for 900 juveniles. The buil ings are from designs by Messrs. Habershon a Fawckner, and are being erected by Mr. W. Griffiths, contractor, of Windsor-road, Cardi They are situate on the eastern side of Conwa road, immediately facing the chapel and schoo room. The front block, besides vestibul entrance-hall, and corridor, contains on t ground floor infant class-rooms on either han each 24ft. by 20ft., and seating about 120 infa scholars, with two class-rooms for adul accommodating respectively 120 and 80 adul At the rear of this block, and approached by t central corridor, is the large assembly hall, 58 by 35ft., surrounded by a gallery. On ea side of the hall, both on the ground floor a from the gallery, open a series of class-rooms, in all, 18 of which accommodate classes of each, the other three being somewhat larg The assembly-hall has a total height of 34f and is lighted from a clerestory roof, as well by a Geometrical window over the end pla form. The principal timbers of the roof a exposed to view, and the whole of the intern woodwork is stained and varnished. Clear gla form the partitions dividing the class-roo from the assembly-hall. The contract pri is £2,550.

EDINBURGH.—During the summer vacatio alterations have been made on a number colleges and schools in the city. The most e tensive work has been done in the way of i provement by the Merchant Company. George-square Ladies' College alone a sum about £10,000 has been expended. A new wi has been added to that institution, and a fi hall, measuring 70ft. by 60ft., has been adde The hall has an open-timbered roof and an e balcony; the hall can be utilised as a gymnasiu The additional wing referred to consists of fo floors, containing nine large classrooms. T alterations and additions, which have been progress for a year, have been finished in ti for the reopening of the College this month. additional story has been placed on Jam Gillespie's School. This will afford four ext classrooms, and a large lavatory, and the ceilin of some of the old classrooms have been raise The tower has also been raised and its appe

...e greatly improved, a Scottish character ...ing been given to it. The school will be re-...ened on Monday next. The cost will be from ...4 000 to £4,000. The architects for the ...rchant Company are Messrs. Macgibbon and ...ss, 65, Frederick-street. At the City Board ...hools minor internal alterations and improve-...nts have been carried out. A new school is ...ng provided for South Morningside, from ...ns by Mr. Robert Wilson, Queen-street, ...inburgh, to accommodate rather over 600 ...ldren. The total cost of the building, which ...l be of Hailes rubble with redstone dressings, ...luding janitor's house, fittings, &c., will not ...eed £9,000.

LLANSHAMLET.—On Thursday in last week the ...w church of St. John's, Birchgrove, Llans-...mlet, was opened. The building comprises a ...ve, tower, and vestry, with room for extension ...stward at some future time. There is not any ...parate chancel at present, but at the east end ...ere is a space railed off as a substitute, laid with ...caustic tiles and fitted with a Communion ...ble. The total length of the church is ...ft. 6in. in the clear. The nave is 34ft. 5in. in ...ngth, and the aisle is 7ft. wide. The width of ...e building throughout is 18ft. 11in. The tower ...10ft. square on the inside. The vestry room, ...ar the east, is 9ft. 4in. by 8ft. 4in. The height ...the building is 15ft. to the top of the wall-...ate on the inside, and to the top of the ridge ...ft. 6in. The building is built of native grey ...ne, with freestone dressings. The plans were ...epared by Mr. J. Birch Paddon, M.Inst.C.E., ...The Drymma, Llanshamlet.

CHIPS.

John Davison, builder, Oxton, who was a mem-...r of the Birkenhead town council, was brought ...in custody on Tuesday before the Registrar of ...e Birkenhead Bankruptcy Court, and underwent ...s first public examination in bankruptcy. He was ...verely cross-examined as to the £490 and cheques ...took with him in his recent flight to Boulogne, ...s excuse being that he was in a "dazed" con-...tion.

Two new schools, which have been erected by the ...anley school board, were opened on Tuesday. ...he Cauldon road schools will accommodate 150 ...rls and 180 infants, and have cost £4,327. The ...rove schools, Northwood, has accommodation for ...0 girls and 172 infants, and cost £4,072.

The Cambridge Music Hall, Commercial-street, ..., is being thoroughly redecorated by Messrs. ...ampbell, Smith, and Co., of Newman-street, W. ...he same firm have also been intrusted with the re-...ecoration of the grand saloon at the Hotel ...étropole, S.W.

A new Workmen's Canteen has been erected at ...M. Dockyard, Portsmouth, and special attention ...as been paid to the ventilation, which is carried ...ut on the Boyle system, the latest improved form ...f the self-acting air-pump ventilator being adopted ...r the extraction of the vitiated air.

The district surveyor's office for Camberwell is ...moved from 33, Talfourd-road, to 244, Camber-...ell-road, S.E. Mr. Ellis Marsland, M.S.A., is the ...istrict surveyor.

On Saturday a steam bakery and abbatoir, ...rected by the Eccles Co-operative Society at a cost ...f £10,000, and situate on a plot of land fronting ...t. Andrew's Church, were opened to the inspection ...f members of the society. Messrs. Jonathan ...errard and Sons, Swinton, were the contractors ...r the main buildings, and the works have been ...arried out from plans prepared by Mr. F. Smith, ...rown-street, Manchester.

It is proposed to erect a new Roman Catholic ...hurch (St. John's the Evangelist) in the Avenue ...t Kidsgrove, Leek. The designs for the new ...uilding—by Messrs. W. Sugden and Son, archi-...ects, Leek—have been approved by the Bishop.

A Primitive Methodist chapel and schools are ...bout to be built at Ashington, near Blyth, from ...lans by Messrs. Davidson and Bendle, of New-...astle-on-Tyne.

A new infants' school at Upper Wortley, Leeds, ...uilt from designs by Mr. Landless, architect to ...he Leeds School Board, has recently been opened. ...t accommodates 305 scholars, and consists of hall, ...2ft. by 36ft., four classrooms, all fitted with ...alleries and dual desks, babies' room, and cookery ...oom. The adjoining schools for elder children are ...lso being enlarged from Mr. Landless's designs.

The parish church of Great Burstead, near Bil-...ricay, Essex, is about to be restored from plans ...repared by Mr. W. J. Wood. The works will ...nclude the reseating of the nave, new choir stalls, ...nd a heating apparatus.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

THE VISIT OF THE SOCIETY OF ARCHITECTS TO BELGIUM.

To the Editor of the BUILDING NEWS.

SIR,—The success of the visit of the Society of Architects to Belgium has been so marked that it is proposed to make it one of a series to various parts of the Continent.

It is difficult to understand why such specially favourable opportunities of studying architecture have hitherto been neglected by societies of practising architects. It is only for such specially organised expeditions that many facilities can be obtained for the inspection and sketching of very many architectural works, as well as of productions of the allied arts and sciences, besides which, men in practice are naturally more discriminating than younger students as to what examples will be most valuable to them, and more able to assimilate the useful matter they collect.

The treasuries of domestic and civil architecture, both Gothic and Renaissance, in Belgium are by no means exhausted, in spite of the fact that one can trace the inspiration of nearly all our best modern buildings (of these classes) to this source, and the careful and copious notes and sketches made by the various members of the society during the past fortnight cannot but have not only a powerful educational effect upon these gentlemen personally, but must also contribute to improve English architecture, especially in the provinces, which is so largely represented in the Society's ranks.

Shall we be considered too sanguine if we entertain a hope, moreover, that our production in England of a vital and vigorous revival of picturesque and refined architecture may before long react upon modern Continental work, which, alas! with the exception of a few notable examples, is still a lifeless art, owing to their too great devotion to the spirit of Classicism?—I am, &c., W. H. SETH-SMITH.

46, Lincoln's Inn-fields, London, W.C.,
Sept. 2.

Intercommunication.

QUESTIONS.

[10615.]—**Hot Water Engineering.**—I shall be glad if the author of "Hot Water Engineering" papers would state what he considers to be the maximum length that might be given to the primary flow and return between boiler and cylinder. I wish to place a cylinder on first floor between a linen closet and bath-room, so as to give warmth to both. This is, however, not immediately over the kitchen, but on the side furthest removed from range, and would require about 41ft. lineal of double piping. If not too far off, would not these pipes be improved by being covered with felt or silicate cotton to keep in the heat. Is it absolutely necessary for the cylinder to be nearer the boiler?—INQUIRER.

[10616.]—**Hot Water Engineering.**—Would the writer of the above interesting articles state in a future number, for the benefit of an engineering student, the maximum length of pipe that should be used with effect for the secondary return from A to B, as shown in Fig. 24, p. 137. Suppose the pipes and cylinders were felted, the pipes fixed only on inside walls, and worked as he suggests with a boot boiler by a 14in. fire, and the cylinder to have a capacity of 60 gallons.—H. STREAM.

[10617.]—**Easels or Drawing Boards.**—Some time ago I noticed in your columns in an account, given in a summarised form, of the mode of working a large architectural business in an American city—Chicago, I think—a statement that the draughtsmen worked at easels instead of on tables. Can any of your readers in Chicago give any description of the easel used, and also whether this arrangement has any conspicuous advantage over the ordinary flat-topped drawing table. Any information on the subject will much oblige.—K. J. H.

[10618.]—**Greasy Marble.**—How can I remove grease from a mantelpiece of white marble without injury to the surface?—QUBRIST.

[10619.]—**Ancient Lights.**—I understand that the law with regard to ancient lights in England is that if a man for 20 years obtains light, for a part of his house, from an open space on his neighbour's property, that neighbour cannot afterwards block it up nor diminish it in any way. Would any reader inform me what difference there is in the law of Scotland on this point, as I am told that unless there is an understanding between parties, an adjoining proprietor can block up light, no matter how long it has been enjoyed.—SCOT.

[10620.]—**Painting Portland Cement.**—Is it advisable to paint Portand cement plain face (finished to a smooth face with steel trowel) as soon as executed, say in about a fortnight? I have heard that it should be previously washed with diluted sulphuric acid. Should be glad to hear from anyone who has tried this, or any other expedient, and found it effective.—THEORY.

REPLIES.

[10608.]—**Heating Houses.**—I always maintain we are terribly at sea on this subject, and that when the external temperature is down to freezing-point an Englishman's fireside is about the miserablest place on earth. I have heard talk of "snug chimney corners" and "cosy firesides," but I never in practice have seen them. The open grates we are so proud of are a luxury, so far as the eye is concerned; but the draughts they create as their food are boneshakers to those who sit in the lines of the doors or windows. The slow-combustion grate is a vast advance upon our old national grate, as it radiates its heat below the line of the cold air current rushing to the chimney, and is thus a factor in raising the temperature of the apartment. The first thing in heating a house should be to keep out the external frosty air. This can never be done by sliding sash windows, nor single casements. The English sliding window is a summer luxury, but a winter curse; for the fire-grate will, in large measure, be fed from this source. Again, the single casement, with an external temperature of, say, 32°, and an internal temperature some twenty degrees higher, draws the heated air to its glass, cools it, and drops it on the floor in a continuous shower. These details are prominent as our coal wasters. For a warm house you require casement windows double rebated, the inner rebate being used for a double or winter casement, the joints of which should be pasted over to render them air-tight, ventilation, when required, being provided through the walls independent of the windows. By this means the draughts from the windows, and the cooling power of one film of glass are destroyed by the neutral temperature existing between the two lines of glass. It is a point that the open fire must be retained. This being the case, a slow-combustion grate should be used, taking care to supply it with plenty of air, for so long as a short supply exists, the grate will smoke. The air should be drawn from internal sources, and should be passed through a warm chamber, on coils of pipes heated at low pressure. This may be arranged by the common grates having boiler backs and connecting pipes. The passages adjoining the living-rooms should be arranged in sections, and not be open to the staircases or roofs of the houses, by which means they could be economised as heating chambers. Apartments thus freely supplied with warm air would prove all that comfort requires. If "Heat" values his health he must not introduce small high-pressure pipes into his private house, for the air roasted by this means is deadly. The air warmed by large low-pressure pipes is not, as a substitute for the summer sun, all that can be desired, but in comparison it is infinitely the best. This warming of air should be conducted by exposing it to a large surface at a low or moderate heat, and not to a small surface at an intense heat. Iron is not a good face to expose air to; a vitreous glaze, if it can be arranged, is

far better. The high-pressure system may be used in large buildings, as its pernicious action on the air is not easily detected; but to introduce it into a dwelling-house is, in my opinion, an act of insanity. It is not a question, as "Heat" puts it, of what becomes of the expansion when the water is turned into steam; but what becomes of the inmates who have to live in the atmosphere?—WM. STEVENSON, Hull.

[10609.]—**Warehouse Floor.**—I would suggest to "Support" the following plan for trussing an old country warehouse floor to prevent sagging. A greater depth of timber is required, so as to minimise the elasticity or sagging of the present beams. The bearing of the beams, and the first yard or so of the timbers from the wall-lines, are not in question; it is, say, the two-thirds of the length of the beams forming the central portion which alone requires consideration. If height in the lower room is not a point, I advise that another beam, falling short of the walls say 3ft. at either end, be bolted underneath each beam, the bolts to be placed about 9in. from either end of the added beams. This, although unquestionably effective, would not look very constructional. If this was a consideration, the continuity of the added beams might be carried to the walls by struts footing in the walls, their feet being, say, a yard below the beams, and their heads abutting upon the added beams, say, a yard from the wall-lines. I take it, from the beams being about 3ft. 6in. centres, that it is a plank floor on beams. If the floor is carried on joists resting upon the beams, various other modes might be suggested. —WM. STEVENSON, Hull.

CHIPS.

The building of a new Roman Catholic Church has just been commenced at Lincoln. The contractors are Messrs. H. S. and W. Close, of that city, whose tender was accepted at £7,310.

A new gymnasium is being built at Warrington, and it will be opened a month hence. The dimensions of the principal room are 84ft. by 43ft., and the height from the floor to the ceiling is 25ft. The cost of the building, including the site, will be about £1,600. Mr. J. E. Wright, of Warrington, is the architect, and Mr. William Taylor, of Haydock-street, in the same town, the builder.

The Royal Gallery at Dresden has acquired a picture by Sir Joshua Reynolds representing a youth dressed in Dunstable hunting costume. It is supposed to have been produced by Sir Joshua about 1760.

It has been decided to hold at the New Gallery, from next December to April, 1892, an exhibition of pictures and objects of interest connected with the 50 years of Her Majesty's reign dating from the Accession to the Jubilee. This Exhibition will form a sequel to the series of historical exhibitions which have been held at the New Gallery during the three previous winters.

An examination of candidates for the certificate of the Sanitary Institute was held at the Shire Hall, Stafford, on Friday and Saturday. Forty-seven candidates presented themselves, including 27 Staffordshire inspectors, who had attended the recent course of sanitary instruction lectures, the others coming from different parts of England and Scotland.

The new workhouse hospitals, Reading, which are nearing completion, are being warmed and ventilated throughout by Mr. E. H. Shorland, of Manchester. In the large wards are fixed Shorland's double-fronted patent Manchester stoves, with descending smoke flues, and in the smaller wards Shorland's patent Manchester grates.

The will and codicil of Mr. William Verity, formerly of 137, Regent-street, gas and electric lighting engineer, and late of Moorcroft, Weybridge, who died on June 12, were proved on the 15th inst., the value of the personal estate amounting to £7,347.

Good progress is being made with the construction of the outer pier at Scarborough, from plans by Mr. Philip J. Messent, engineer to the Harbour Commissioners. Of the apron, 420ft. out of the proposed 650ft. has been finished, and the whole work will be completed this season.

The death occurred on Sunday of Mr. Sheridan Daynes, of North Walsham, who, for a period of 34 years, had been connected with the well-known building firm of Messrs. Cornish and Gaymer, in which position he had gained the esteem and respect of all the employés. Mr. Daynes, who was 50 years of age, had also prominently identified himself with many useful institutions in the town.

A new sort of electric-bell has been devised by an American inventor, consisting of a vibrating plate of metal, like the reed of a parlour-organ, which is set in motion by the electro-magnet, and emits a clear and continuous musical sound, less irritating to hear than the startling rattle of the ordinary electric-bell.

At St. Bartholomew's Hospital on Wednesday week, Mr. Langham inquired into the cause of death of John Graver, aged 58, a carpenter and joiner, who died suddenly on the previous Saturday at the new buildings now in course of erection at the General Post Office. A verdict of death from natural causes was returned.

LEGAL INTELLIGENCE.

AN IMPORTANT DECISION ON NEW ROADS.—At the North London Police Court on Thursday, the 27th ult., Messrs. Isaac Edmondson and Son, builders, were summoned before Mr. Haden Corser by the London County Council for unlawfully laying out a road, passage, or way, known as Newington-turning, as a public carriage-way in such a manner that such road, passage, or way would not directly communicate at both ends with a public carriage-way, contrary to the 53rd and 54th Victoria, cap. 243. Mr. Buckmaster, who appeared for the London County Council, stated that the defendants had laid out one portion of Newington-turning as a carriage-way to the full width of 40ft., but they had failed to make the whole of the footway a carriage-way. Mr. C. Glenn was counsel for the defendants, and stated that when the building estate was finished Newington-turning would be intersected by another carriage-way or road, which had already been staked out, and he produced a plan showing this arrangement. He also referred to an estate at Herne Hill where the road was not 40ft. in width. Mr. John Hebb, assistant architect to the County Council, Mr. Henry Lovegrove, the district surveyor, with the notices, &c., the surveyors to the estate, Mr. C. Herbert Shoppee and Messrs. Buckland and Garrard, also Mr. C. J. Bentley, were in attendance, but only Mr. Hebb gave evidence. Mr. Corser dismissed the summons, with £5 5s. costs, and notice of appeal was given.

WATER SUPPLY AND SANITARY MATTERS.

COWLYD WATER SCHEME.—A meeting of the joint authority of the Conway town council, the Conway rural sanitary authority, and the Colwyn Bay local board was held on Friday, in connection with the Cowlyd water scheme, which was formally adopted. Mr. Farrington, C.E., borough surveyor of Conway, who is in charge of the scheme, was formally appointed engineer. The estimated cost of the scheme is £16,000, the engineer estimating that the works would be carried out in twelve months. The clerk was instructed to advertise for tenders, and to make immediate application for the loan sanctioned by the Local Government Board. In compliance with the recommendation of Mr. J. Ritchie, C.E., it was decided to use 12in. instead of 9in. pipes, the chairman stating that this would raise the cost of the lake from £1,000 to £1,700.

EDINBURGH.—The full text of a report by Messrs. Gale, Hill, and Mansergh, and Messrs. Leslie and Reid, civil engineers, on the proposed additional supply of water for Edinburgh and district, has been published. The three suggested sources of supply, from the Manor, the Tweed, and St. Mary's loch, are dealt with, and the adoption of the Manor scheme is "strongly recommended." The Manor (a tributary of the Tweed), it is pointed out, is the nearest of the three sources to Edinburgh, and the water obtained is the best in point of quality. For fifteen million gallons per day the total outlay is set down at £842,440, or by an alternative scheme at £873,005.

HUDDERSFIELD WATERWORKS.—The first sod of the new Butterley Reservoir, one of a series constructed in the Wessenden Valley, above Marsden, was cut by the vice-chairman of the Waterworks Committee of the Huddersfield Corporation. The new reservoir will cover 41½ acres of land, it will contain when full 400,000,000 gallons of water, and will make the eighth reservoir belonging to the Huddersfield Corporation. The Corporation of Huddersfield have bought the rights of the Wessenden Water Commissioners, and have acquired the whole of the water area in the Wessenden Valley. The construction of the Butterley Reservoir was planned by the late Mr. John Stanway, who had, to a large extent, the superintendence of the construction of the Blackmoorfoot reservoir, which will hold 700,000,000 gallons, and is the largest of the series. Mr. Stanway died suddenly in May last, a few days after he had paid a visit to the site of the ninth reservoir at Bank Bottom, down the valley. The work will be carried out on the lines laid down by Mr. Stanway, and Mr. J. E. Hughes, of London, has been appointed to superintend the work.

LANARKSHIRE.—The District Committee of the County Council of the Middle Ward of Lanark are at present considering an important scheme for the supply of water to the numerous populous villages and agricultural properties in the area under its care. The district, measuring twenty miles in length by twelve across, has an estimated population, exclusive of the burghs, of 112,642, and there are now special supply districts in existence which represent 740,000 gallons per day. The new scheme will provide an extra 2,000,000 gallons, to be distributed, according to the population, on a basis of 25 gallons per head per day. The scheme is the first of the kind taken up by a County Council in Scotland, whose hands in this case have been strengthened by an Act passed last y amending the Water Clauses Act, under wh County Councils are authorised to levy a gene public water rate, as water trustees are authori to do in towns, not exceeding 3d. in the £1. T cost of the new scheme is estimated at £220,0 The Committee have consulted Messrs. Leslie a Reid, C.E., Edinburgh. The reservoir propo under their scheme will be on the Glengavel wat a tributary of the Avon which flows into the Cly at Hamilton; and there will be required som thing like 100 miles of pipes. As the reserv will be 850ft. above sea-level, most of the distr will be supplied by gravitation. The drainage a to be annexed at first is 3,700 acres, and there additional areas that may be diverted into t reservoir of 1,417 acres and 755 acres respectivel

WATERWORKS FOR TULLAMORE, IRELAND.— meeting of the committee appointed by the sanita authority to select plans sent in for competition above project was held on Thursday, 20th Augu There were four competitors. After an exhausti examination of the different competitors on t merits and demerits of their schemes, the committ were unanimous in selecting the scheme forward by Mr. R. P. Gill, Assoc.Inst.C.E.I., of Armag co. Tipperary. The scheme is entirely a gravitati one, taken from the Clodiagh river, about six mi from the town. The reservoir, filters, and pu water basin will be of concrete. Six-inch diamet cast-iron turned and bored jointed pipes will fo the main, with 4in. and 3in. pipes through t town. Population to be supplied is about 5,0 daily supply will exceed 100,000 gallons, estimat cost about £6,000. At a meeting of the sanita authority on Tuesday, 25th August, the action the committee in selecting Mr. Gill's plan w ratified.

The foundation-stone for a new Primiti Methodist Chapel at Wrekenton, near Gateshea on-Tyne, was laid on Saturday last by Mrs. J. Robson, of Gateshead. The architect for the ne building is Mr. James W. Frazer, A.R.I.B.A 12, Grey-street, Newcastle-on-Tyne, and the co tractors Messrs. Woodall and Wilson, Gateshead.

The foundation-stone of a new Roman Cathol church, to be erected in Llandudno, will be bless and laid by Dr. Knight, Bishop of the dioces on Thursday next, the 10th inst. Mr. Edmu Kirby, F.R.I.B.A., of Liverpool, has given t designs for the building, which will be in t Decorated Gothic style, and Mr. John D. William of Knighton, Radnorshire, is the builder.

The memorial to the late Canon Hannah, Edinburgh, will take the form of a Celtic cross white Sicilian marble, which will be erected ov the grave of the deceased in the Grange Cemeter Edinburgh. Designed and sculptured by Mr. Gun of Messrs. Gunn and Co., 130, George-stree Edinburgh, the cross will stand about 13ft. hig and will be ornamented after a typical Celt pattern.

The next Convention of the American Institute Architects is to be held in Boston, Mas., some tim in October, the precise date not being yet fixe An exhibition of architectural drawings by arch tects now residing in the States will be held in co nection with the Convention, and a joint committ of the Boston Society of Architects and the Bost Architectural Club has been appointed to make t arrangements.

Colonel J. Ord Hasted, R.E., Inspector of t Local Government Board, held an inquiry Darlington on Friday, the Town Council havin made application to borrow £4,000 for the extensio of the Town Hall and offices, and also £1,700 f erecting a new bridge to the park, street improv ments, and additions to the baths. With regard t the town hall extensions, the town clerk explaine that the present accommodation was inadequat It was proposed to extend the buildings from th town hall eastward 61ft., and provide a council chamber, a mayor's chamber, and committee-room The borough surveyor explained the plans. M G. G. Hoskins, architect, and Mr. George Marshal builder, opposed the scheme, the former suggestin till new municipal buildings were erected, that small extension of the accountant's clerks' office b made.

At the last meeting of the Preston town counci Mr. Yates Booth drew attention to the long-delaye opening of the Harris Free Library and Museum erected at a cost of over £100,000 two years ago b the Harris Trustees, but still unfurnished. H understood there were disputes between the trustee and two contractors, who claimed together £9,99 and that some of the architect's claims were in dis pute. Alderman Hibbert, chairman of the com mittee, and also the architect, said if the trustee had done what he advised three years ago th building would have been opened this year. If the would now act on Mr. Justice Chitty's order, to th same effect, the building could be furnished fo opening in twelve months.

Our Office Table.

The inaugural address to the Royal Institute of British Architects will be delivered by Mr. MacVicar Anderson, President, on Monday, November 2nd. On the 25th January, 1892, Mr. Anderson will publicly present the prizes and medals, and will give an address to the students. The four business meetings of the Institute are fixed for the 16th November, 1891, the 18th January, 7th March, and 13th June, 1892. The next preliminary examination is arranged for the 24th and 25th November, 1891, and the next intermediate examination for the 24th, 25th, and 26th November, 1891. The spring examinations are: Preliminary, 15th and 16th March, 1892; intermediate, 15th, 16th, and 17th March, 1892; final, during the week commencing 28th March, 1892.

The new education scheme of the Architectural Association is gradually assuming a definite and concrete form. Temporary premises for the studios and classrooms have been taken at 56, Great Marlborough-street, W. The lecturers will include Mr. F. R. Farrow, who will deal with "The History of Architecture"; Mr. Ravenscraft Elsey Smith, who is to lecture on "The Orders and Classic Ornament," a subject in which he is well qualified by his explorations in Athens; and Professor Robert Kerr will treat on "The Arts of Construction." The studio will be under the superintendence of two Academy medallists, Mr. R. W. Schultz taking the junior and Mr. J. A. Slater the senior students. The chief instructors in the more scientific subjects will be Dr. Holmes and Messrs. Moody and Hancock.

This year the complete list of purchases which have been made for the nation under the terms of the Chantrey bequest is as follows: "St. Elizabeth of Hungary's Great Act of Renunciation," by P. H. Calderon, R.A., purchased for £1,200; "Pandora" (marble statue), Harry Bates, £1,000; "Lions" (drawing), Harry Dixon, £100; and "The Winter Sun in the Wild Woodland" (oil), J. W. North, £315. The first three works were exhibited at the Royal Academy, and the last at the New Gallery. Since the year 1877, when the Chantrey fund first became available, the collection consists of 78 works. Of this total, 18 only are by members and associates of the Academy, the remaining 40 being by outsiders. Three artists have twice been favoured by the trustees. Sir F. Leighton, one picture, "The Bath of Psyche," and one statue, the "Athlete struggling with a Python"; Prof. Herkomer and Mr. Joseph Clark with two pictures each. Of the 40 outsiders who have obtained the honour of selection, ten have since been elected into the academic body.

At the annual meeting of the Society of Art Masters just held in the Lecture Theatre, South Kensington Museum, information was sought as to the extent to which schools of art had participated in the grants made by local authorities under the Technical Instruction Acts, 1889 and 1891, and under the Local Taxation (Customs and Excise) Act, 1890, and it was generally felt that in the distribution of funds under these Acts they had not, except in isolated cases, received the consideration to which they are justly entitled, seeing that their teaching in draughtsmanship, modelling, and design is of the highest national importance, in all their stages, to the numerous manufactures of the country in which a knowledge of the principles and practice of applied art is a first essential. The society, therefore, unanimously adopted the subjoined resolution, in the hope that masters of schools of art, and the members of their committees, will not fail to place it in the hands of gentlemen interested in art education, especially those who may be members of Municipal Corporations, County Councils, and other local authorities, in support of a formal application for assistance from the sources referred to:—

"The members of the Society of Art Masters, including about 100 masters of schools of art in all parts of the United Kingdom, desire to represent to gentlemen interested in art teaching who are members of County Councils, Town Councils, and other local authorities, that the teaching carried on in these schools is of the highest educational importance, and especially in relation to art as applied to manufactures; and that it is therefore, in the truest sense, technical instruction of the highest national value. They therefore desire to urge upon all local authorities the strong claim which these schools have to a considerable share in the grants made under the Technical Instruction Acts, 1889 and 1891, and under the Local Taxation (Customs and Excise) Act, 1890."

A limited liability company of unusual character is announced in the financial journals of this week under the title of "Browne and Parry, Limited." It is registered from a City address, with a capital of £500 in £1 shares. The object is to carry on the business of architects and surveyors, and civil engineers, auctioneers, &c., in all branches. The firm is registered without articles of association. Such commercial undertakings for carrying on professional work are not infrequently floated in the United States, but this is the first of the kind we have seen here.

The death occurred last week of Mr. Leonard C. Wyon, modeller and engraver to the Royal Mint, and one of a family that has long been associated with that Department. Mr. Leonard Wyon was the son of the late Mr. William Wyon, R.A., chief engraver to the Mint, and was born at the Mint in 1826. He was silver medallist of his year at the Royal Academy. He designed the present British bronze coinage, the coinage of Australia (1857), New Grenada (1858), Canada, Cyprus, United States of Colombia, Straits Settlement, Jamaica, Uruguay, Hong Kong, Japan, Peru, Newfoundland, and the present coinage of British India. His miscellaneous medals were exceedingly numerous, and included a medal of the Emperor Nicholas of Russia, another to commemorate the exchange of visits, in 1855, between the Queen and the Emperor of the French, and a portrait of William Wordsworth (1848), from a drawing from the life.

The twenty-first annual exhibition of modern pictures held under the auspices of the Walker Art Gallery, which was opened on Monday, is the best collection brought together in Liverpool for a dozen years past. There is a great diminution, compared with recent years, in the number of works displayed, 1,281 in all. No. 8 room has been hung by J. M. Whistler, and on a greyish wall a few pictures, including one by that artist himself—his "Arrangement in Black—a Fur Jacket"—are hung with wide intervals. The most attractive works include "Christ among the Doctors," by Holman Hunt, and four pictures from the recent Academy—Luke Fildes' "Doctor," Calderon's "St. Elizabeth of Hungary," Leighton's "Perseus and Andromeda," and G. F. Watts's "Lady Catherine Thynne." There are three portraits of Mr. Gladstone, including the one by Robert Holt to be presented to the Liverpool Institution. The water-colours number 500 and the pieces of sculpture only 50.

Several interesting additions have just been made to the collection of casts of sculpture and architectural ornament at the Edinburgh Museum of Science and Art. Of these the earliest is the font and its tabernacle in the church of San Giovanni at Siena, a work completed in 1430 by Jacopo della Quercia. On each of the six sides of the font is a sculptured panel in gilt bronze, representing a scene in the life of John the Baptist. The other two new casts are the monument to Carlo Marsuppina, by Desiderio da Settignano, in the church of Santa Croce at Florence, and the tomb of Archbishop Uriel von Gemmingen in the Cathedral of Mayence (*c.* 1514). A number of copies of small German works of the 16th century have also been added to the museum, including two life-sized figures, placed at opposite corners of a house in Nuremberg, by Adam Kraft, and representing the Annunciation; cast of a "Pieta," by Veit Stoss; statue of a man in armour, after Peter Vischer; and figures of two "Dancing Fools," after Erasmus Grasser. From South Kensington a number of architectural casts have been received by the Edinburgh Museum, the most important being details of Saracenic work from Cairo.

The Council of the Society of Arts are prepared to offer, under the terms of the Stock Trust, a gold medal, or a prize of £20, for competition amongst the students of the Schools of Art of the United Kingdom, at the Annual National Competition held in 1892. The prize is offered for the best original design for architectural decoration, by means of painting, stucco, carving, mosaic, or any other method, such as that for the side of a room or hall, a ceiling, or the apse or side of the chancel of a church. The design must be on imperial sheets, and must be accompanied by drawings of details on separate imperial sheets. Mere patterns, or pieces of painting and modelling, without the mouldings or borders necessary to make up a complete decorative scheme, will not be taken into consideration. The work is to be that of the previous school year. The designs are to be submitted in the usual manner to the examiners, at the Annual Competition (April, 1892) of the Department of Science and Art. Competing designs must be marked, "In competition for the Stock Prize," in addition to being labelled and staged according to the regulations of the Department of Science and Art.

The *American Architect* says:—"Mr. Thomas, of New York, the architect of the new Armoury at the corner of Fourth Avenue and Thirty-fourth-street, has placed himself in a position where his experiences will be edifying to the rest of the profession, if not very agreeable to himself, by guaranteeing, under bonds, that the cost of the building will not exceed a certain amount. After the plans had been approved by the Building Bureau, a discussion took place in the Board of Commissioners as to the method of advertising for bids for carrying them into execution. Mr. Thomas advised inviting separate bids for the different portions of the work, on the ground that the bids obtained in this way would be likely to amount, in the aggregate, to less than a bid made by a single contractor for the whole work. Some of the board thought a single contractor could be better held to a fixed time of completion than a number of independent contractors. Mr. Thomas thought that, as he guaranteed the cost, under heavy bonds, his opinion in regard to the mode of making contracts ought to have some weight, but his wishes were coolly disregarded, and the order was passed to advertise for bids in gross." English architects will be interested in hearing the outcome of Mr. Thomas's guarantee, and especially to learn whether he has had to pay a forfeit.

La Nature has remarked on the employment of electricity for working pile-drivers. An electric-light plant lying idle during the day was employed for the purpose. An Edison motor was mounted in the lower part of the pile-driver frame, and transmitted power to a chain drum fitted with fast and loose pulleys. By means of a suitable cut-out the current could be diverted from the motor to a resistance box when power for hoisting the pile driver was not needed. A current of 64 ampères and 100 volts was employed, and the generator was 330ft. distant. The conductor was a copper wire 0·2in. in diameter.

The ancient pavement in the Papal Lodge of the Vatican, which was destroyed about 1859, and of which now only fragments and designs are left, is the subject of a paper by Signor Tesorono. These pavements in majolica were laid, by order of Pope Leo X., by the two brothers Robbia, both Dominican friars, after designs by Raffaele. Signor Tesorone has compared this work with other ornamentation in the Vatican. He has tried to find fragments of the precious work in other parts of the Vatican or elsewhere; but while it is dubious whether he has been successful in that attempt, he has discovered examples of ancient work belonging to the same period as the Logge of Raffaele, including some done by the brothers Robbia.

The United States Census Bulletin, No. 100, gives an interesting record of the streets, lighting, water-supply, sewers, police, and fire departments of the 50 principal cities in the United States. Of the 50 cities 22 have a population of over 100,000 each, and a total of 8,737,648, or 13·95 per cent. of the total population of the United States. The average density of the population in these 22 cities is 10,190·03 to the square mile, or 15·92 to the acre. There are, however, enormous differences in the ratios of population to area included in the city limits of these various cities. All the streets of Boston, Worcester, and Holyoke are paved, while in Denver none are paved, and in Minneapolis but 3·1, in St. Paul 4·1, and in Dallas 4·7 per cent. are paved. The average yearly cost of construction and repairs per head of population in cities having over 100,000 inhabitants is 1dol. 54 cents, and in 27 cities of less than 100,000 inhabitants it is 2dol. 4 cents. The amount per head of population annually ex-

pended in street cleaning varies from 5 cents in Buffalo and 8 cents in Chicago, to 71 cents in New York and 62 cents in Cincinnati. There is, however, no definite relation between the cost per head of street cleaning as shown by these figures and the actual condition of the streets as to cleanliness.

Another U.S. Census Bulletin, No. 96, prepared by Mr. Charles Kirchoff, of the Division of Mines and Minerals, deals with copper production. This report shows the United States to be now the largest producer of copper in the world, the product for the year 1889, the last one tabulated, being 226,055,962lb., or 109,017 tons. About 8,700 men are employed in copper mining. During the last ten years, Arizona and Montana have made wonderful progress in the mining and production of copper, and Montana now leads all other States in this production, its product, nearly 43,850 tons, exceeding that of Michigan (which has heretofore been the leading producer) by one-eighth.

The Institute of Architects of New South Wales have been actively engaged in formulating various forms and codes for professional practice. Some time ago the Institute of the colony adopted a code of professional charges and practice based on that of the Institute of British Architects, and are now engaged in preparing conditions of contract. We hope the committee will first obtain evidence of existing practice and clauses, and consult contractors as well as architects. The Royal Victorian Institute, judging from its annual report, has been doing useful work in issuing diplomas to members, in establishing a scheme of examinations, and in discussing questions like the regulation of competitions, conditions of contract, architectural pupilage, sub-letting, appointment of quantity surveyors, and last, though not least, a draft bill has been prepared and discussed for the registration of architects. Our younger and more active societies in Australia, as elsewhere, are beginning to see that registration is the only practical measure to place architecture in a recognised position.

The *Chamber of Commerce Journal*, in an article on the resources of the Congo Free State, remarks that the Upper Congo abounds in forests, and many of the woods are hard, and would prove of value in Europe. Mahogany and ebony, camwood, and a timber strong almost as teak, known locally as ironwood, are found in the interior; but the question of transport stands in the way of their being utilised by commerce. Probably the Kwilu river, in French Congo, some 100 miles north of the Congo mouth, offers a better field for the timber merchant, since for the 80 or 90 odd miles of its navigable course from the sea it flows through the great Mayumba forest, which will eventually yield timber as fine as any now in the market coming from Africa. The timber of the Gold Coast, which is no finer than that of the South-West Coast, has already begun to attract attention, and companies are being formed to work the forest regions bordering on the courses of the rivers draining that portion of the Gulf of Guinea.

The Moorhouse Sawmills in Maxwell-road, Pollokshields, Glasgow, owned by Messrs. J. Watt Torrance and Co., were destroyed by fire on Friday.

The Italian Government denies the truth of the report that the excavations at Pompeii have been suspended for want of cash. On the contrary, the excavations, not only at Pompeii, but also at Vetulonia, Rome, and in other place, are still going on, the allotted funds being sufficient for the purpose.

A fountain, erected by public subscription in the park at Bloxwich, near Wolverhampton, was inaugurated on Monday. It was supplied by Messrs. G. Smith and Co., of Glasgow.

The Manchester city council approved, on Wednesday, a resolution passed by the gas committee declaring that it is necessary to raise the sum of £150,000 by exercising the borrowing powers conferred by the Electric Lighting Acts, and authorising an application to the Local Government Board for permission to borrow that sum.

Mr. Johnston has resigned office as Surveyor to the Commissioners of Rathmines, near Dublin, after more than forty years' service. At Wednesday's meeting of the commissioners, a resolution was unanimously passed conveying the thanks of the members for the efficient manner in which he had discharged his duties, and wishing him all happiness in his well-earned retirement.

Trade News.

WAGES MOVEMENTS.

Arbroath.—The operative slaters have received intimation that on the 22nd inst. they will receive an advance of ½d. on hour on their present rate of wages, extending to March, 1892. The wages will thus be raised from 6½d. to 7d.

The Strike of London Carpenters.—There is but little change to note in the position of affairs in the building trades of the Metropolis. Both sides express themselves confident of ultimate victory, the employers stating that the busiest season is going by, and predicting that the coffers of the men will be exhausted by the long-continued demand upon them; while, on the other hand, the men point to the fact that each week fresh firms concede the terms of the memorial, and allege that the "struck" firms who are keeping their shops open are paying 10d. and 10½d. an hour, besides railway fares and bonuses, and, in certain cases, providing lodgings and food. The carpenters have been greatly hampered during the past fortnight by the serious illness of Mr. G. F. Watts, the energetic secretary of the United Trades Committee, who is confined to bed through hæmorrhage of the lungs, aggravated by his exertions at demonstrations, in visiting pickets, and at office duties. During the week funds have come in more freely from provincial centres, and a grant of £21 has been made by the Portmanteau Makers' Society. A fresh levy of 6d. per man a week has been made at Birmingham, and will be continued while the dispute lasts. The strike pay is still being distributed at the rate of 9s. per man per week. Fifty-seven firms have now conceded the demands made, the latest additions being Crace, of Wigmore-street, and Morant, of Bond-street. Several demonstrations were held in London on Sunday in aid of the funds, of which the more important were those at Peckham Rye; at North Camberwell, Mr. Ben Ellis in the chair; and St. Pancras arches, where three mass meetings were held. At each of these meetings, those present pledged themselves to support the movement to the utmost. A meeting of representatives from nearly all the unions engaged in the building trades was held on Wednesday night at the Rose and Crown, Old Bailey, to consider the best means for rendering assistance to the carpenters and joiners. The trades represented were masons, bricklayers, plasterers, painters, builders' labourers, plumbers, glaziers, wood-cutting machinists, lath-renders, navvies, and bricklayers. Mr. J. G. Bowern presided, and laid before the meeting the present position and prospects of the strike. The following resolution was carried unanimously, having been moved by Mr. Harvey (plasterer), and seconded by Mr. Richards (operative bricklayer):—"That this meeting of representatives of all branches of the London building trades pledges itself to support the carpenters and joiners in their struggle to obtain an eight-hour day by using every effort of the organisations we represent to obtain their financial and moral support."

Lincoln.—The carpenters and joiners of this city have gained practically all that they struck work for. The employers have not only advanced the wages ½d. per hour, making the rate of pay 7½d., but they have agreed to the code of working rules which the men drew up subject to some modifications. The bricklayers have been equally successful, their demand for a rise in wages of ½d. per hour, viz., from 6¾d. to 7¼d., being granted. It has been mutually agreed that any further disputes that may arise shall be settled by a Board of Conciliation, consisting of six master builders and a like number of operatives.

Newport, Mon.—The bricklayers of Newport were recently on strike for six weeks, demanding an increase of wages from 7d. to 8d. per hour. The masters offered 7½d., leaving the additional ½d. to arbitration, offering to pay it from the resumption of work if the award was against them. The arbitration took place on Wednesday in last week, but the result has not yet been published.

North Wales Quarries.—Lord Penrhyn, having refused to concede the demands of his quarrymen for an increase of 10 per cent. in wages, an agitation arose among the younger men in favour of a strike, although this course was protested against by the Quarrymen's Union. On Tuesday, however, a ballot was taken, with the result that the majority pronounced against a strike.

A new board school at Colinton, near Edinburgh, a spacious building designed by Mr. R. Wilson, architect, of Edinburgh, was opened on Tuesday.

The foundation stone of the new river harbour at Thurso was laid on Thursday in last week by the Duke of Portland. Mr. Barron is the engineer, and Mr. John Mackay the contractor. The outlay will be about £17,000.

CHIPS.

Mr. G. St. P. Connolly, Colonial architect Queensland, has severed his connection with t Government of the Colony. It has now be decided to rearrange the Department of Pul Works, and all matters connected with divisio boards will be transferred to the Colonial Sec tary's Department.

A group of public buildings, consisting of magistrates' court-house, police-station, local bos offices, banking premises, and suites of offices, about to be erected in Station-road, Colwyn Ba The architects are Messrs. Booth, Chadwick, a Porter, of Manchester and Colwyn Bay.

The decoration of the church at Sneyd, Staff has been supplemented by a mural painting ov the chancel arch, consisting of a representation the Resurrection. The painting has been design and executed by Mr. Frederick Rhead, of Stoke-o Trent.

The late Signor Benedetto Romagnani, of Pistoi Florence, has left to the Corporation of the City London "the centre of a chandelier from the saloo of Vessalo, composed of six parts, and decorated the middle with the Triumph of Neptune and oth ornaments."

Holloway's Ointment.—This cooling Ointme perseveringly rubbed upon the skin, is the most reliable remedy overcoming all diseases of the throat and chest. Quinsey, relax tonsils, sore throat, swollen glands, ordinary catarrh, and bronchi may be arrested as soon as discovered, and every symptom banish by Holloway's simple and effective treatment.

PROFESSIONAL PROBLEMS.

HOW to obtain clients and keep them is one of the first and hardest lessons to be learned by the professional man. He soon finds out that acquirements are for very little without that other gift of turning his knowledge to practical account in the most adroit manner he can, and in applying what he has learned. Not every-one has the genial and persuasive personality which attracts and captivates, and which, in too many cases, succeeds where talent or ability fails to secure attention. A man may have had the advantage of passing his pupilage with an eminent architect, of going creditably through his examinations, and of having good family connections, yet without being able to do so much as one who has begun life as a builder's clerk, and has been grown into business in a rough-and-ready manner, without education or friends. But we find it so in every vocation. Industry and energy are, of course, considerable factors, but not the only ones. Much is due to perception: of seeing rightly the requirements of each case as it arises, of discerning quickly the mode of dealing with certain problems, and of turning to account the knowledge or experience that has been learned. The young architect brought up in the traditions of the drawing office is helpless. He has, with few exceptions, a very imperfect idea of any problem presented to him other than those he has learned from books and from copies of buildings. His mind has never realised the concrete problem, the relation of design to material and labour, how it can be carried out between employer and builder, the legal obligations involved in construction, and the hundred other things which distinguish building from mere draughtsmanship.

How to make oneself master of these practical views of architecture is not easily discerned. The young architect finds the building operative a match for him very often. Many points and "wrinkles" in carpentry or joinery or masonry cannot be learned in the office, or from books. A deviation from the working drawing or specification arouses the architect's disapprobation, but the workman has a very good explanation; the prescribed form, or mode of construction, is not practicable; it cannot be worked as shown, or it is exceedingly wasteful. The joiner has executed it in another way. The reasons assigned are recognised as practical, and the workman's mode is adopted, but still there is something that does not please the architect. If he had only the practical knowledge of the joiner or mason, how much better the result might have been. He feels, at least, he has been beaten on grounds that might have been avoided by a little practical knowledge, and which a month in a joiner's shop would have supplied.

The builder, too, can often present to the mind of the employer those points which have a more direct interest for him. One of these is *cost*. It is a singular thing that architects, as a rule, try to evade this item. But it is just the question which most touches men who have property, and who study the money-markets, and desire to know where the best investments are to be found. To them cost is the chief consideration. To the commercial man it is of the first importance to know how much he can lay out on building a new warehouse or business premises without hampering his resources, and he naturally likes to have a reliable estimate. How few in the profession are able or willing to say how much such an accommodation will cost, what price per cubic foot a warehouse of a certain class should be, the cost per head or per sitting of a school or a church! And yet these data are within reach of any practical mind. The builder knows the figure by experience. The relative cost of buildings in wood, brick, and stone can be found by comparison, and it is a pity architects do not take the trouble to compare results with respect to buildings they have carried out, noting not only the cost per foot cube in varying materials, but the relation of floor space to cost, of quantity of goods stored, the price per head accommodated, or the sitting. The study of estimates is dry and repulsive to many minds; but if they can be analysed a little more, and the amounts of contract divided by the accommodation offered, the number of rooms, the area in feet, and so on, the subject would be rendered an interesting one. For example, an estimate might be considered in relation to the amount of material employed or the trades engaged. Thus, in a particular class of building the brickwork or carpenters' work may represent a certain proportion of the whole cost, and this fact is useful in approximately estimating a similar building. Again, the relative amount of labour to material in each trade is of value to the architect in estimating or in checking tenders. Proportions may be applied in other ways, as in determining the proportion of beds and joints to each cubic foot of stone, which varies for different classes of masonry. Only a practical surveyor or a builder can carry these methods in his head, though there is no reason why they should not be acquired by the architect. An employer may sometimes like to know how much extra it would cost to put a Portland stone ashlar-faced front to a building instead of brick. An experienced surveyor would say the cost would be from 5s. 6d. to 7s. per cubic foot, according to the quantity, including architectural details like pediments, pilasters, and groins. To one unpractised in estimates the careful measurement and quantities of the stone and labour from the drawings would be necessary. We do not recommend "rule of thumb" methods of estimation, for they are often unreliable; but we say that a scientific mode of classifying labour and material and building estimates or tenders might lead to a saving of time, and to the establishment of data of considerable value to the profession.

Contracts are a branch of the architect's business that can be learned only after the term of pupilage. Books and forms of contract are plentiful, but they do not instruct. The architect has very often to prepare his own contracts, or, if not, to frame one for the assistance of the legal adviser, and his only resort is to use one of the forms published, such as that issued by the Institute of British Architects. These forms do not supply the legal or technical qualifications necessary for the profession in protecting clients. When a disagreement occurs about orders for extras, a certificate, or some question as to material or workmanship, the clause is appealed to by both parties to the contract; but the architect finds that there is a little ambiguity, or that the builder has managed to keep within the letter while disobeying the spirit, or it may be there is a loophole of escape. Only those who have had experience in arranging disputes under contracts of this kind are prepared to draw up their provisions to meet any of the many points or questions likely to arise. The question whether the bill of quantities should form part of the contract or not, and another question that has come to the front of late, that of permitting underletting or sub-contracts, are matters which presuppose a general knowledge of business and the relation of labour to wages. These can only be learned in one way, and that is by coming into contact with contractors and surveyors and workmen, and hearing both sides of the question. The profession are a long way from agreeing as to the best mode, though a committee of the Institute some time ago considered that sub-contracts were often advantageous, because, for one reason, they enabled contractors with small capital to obtain efficient skilled hands for special kinds of work which they could not execute themselves, and therefore they could compete on better terms with large contractors who kept skilled hands all the year round. Other weightier reasons may be urged for allowing a contractor to sub let. It enables many skilled hands to obtain a share of the large contracts; it induces a higher class of workmanship, and it encourages individual interest in the work. But the trade unions have arguments to use on the other side against the practice of under-letting, and big contractors who keep a large number of men of various trades naturally object to the system. Both sides require a careful attention on the part of the architect; but it will be often found that circumstances may favour one or the other view, and no hard-and-fast rule can be enforced. Political economy is not one of the favoured studies of the student of architecture, though he is brought so frequently into contact with problems in which labour and wages are concerned that he ought to be prepared to advise. Take, for instance, the present carpenters' and joiners' strike. Few in the profession have probably taken much more than a very transitory interest in this strike, yet the reduction of the hours of labour and the rate for overtime have important bearings on future contracts. In what relation the skilled workman should stand in connection with building is a question that ought to receive immediate attention. By no means can the present relation under contract be deemed satisfactory.

The legal problems which come before the architect are numerous. Everyone engaged in building knows how wide is the range of legal questions. Landlord and tenant is a very important division, and a great many points are continually occurring as to leases and covenants. What is "good tenantable repair"? The architect is expected to advise his client as to these points. A fund of common legal knowledge must be acquired, in addition to decisions of the Judges and the definitions of the Courts. It will not do now to be ignorant of such a judgment as that of Lord Esher in "Proudfoot v. Hart" as to a tenant's contract in keeping premises in "good tenantable repair." The whole subject of dilapidations is a question requiring much study and insight into the two kinds of waste, permissive and voluntary. A great diversity of opinion is to be found as to what is a dilapidation, and how it can be ascertained. A client wants to know what sorts of dilapidations he is liable for; but hardly two surveyors will agree, the fact being that the matter is a subject very much of construction under different holdings. Although lawyers and surveyors have written many useful textbooks on the question, they are of little use in instructing the professional man to determine in certain circumstances for what repairs his client is liable.

A great deal more is to be acquired by making notes as they occur in practice, and in using that common sense and judgment in finding out first what a client's covenants are, what was the real condition of the premises when first taken, and then to apply those principles of judicious criticism which consist in determining how far a tenant is liable for voluntary or permissive waste; firstly, for example, in altering the premises

prejudicially in the eyes of the grantor, and secondly in neglecting or omitting to repair the effects of time and use.

SOUTHAMPTON FREE LIBRARY COMPETITION.

ALTHOUGH Southampton has one fine institution devoted to the pursuit of Classical and Oriental literature, science, and art at the southern end of the town, the Corporation authorities have not overlooked the development of the town northwards. Competition designs for a free library on a site facing the upper Parks were invited some time ago, and no less than 37 sets have been sent in and have been on view. One of the conditions of the competition was that Mr. Wm. Henman, A.R.I.B.A., of Birmingham, was to act as an assessor, and that gentleman has awarded the first place to Mr. A. E. J. Guy, of Southsea, and the second premium to Mr. Sidney R. J. Smith, A.R.I.B.A., of the Adelphi. The very irregular shape of the site at the junction of three roads, and the necessity imposed on the authors of designs to make the frontage of the principal elevation conform to the obtuse angle formed by the main roads, increased greatly the difficulty of designing a building having any pretensions to architectural dignity. The irregularity of the site has also resulted in a considerable diversity of plan, and has called for a great deal of ingenuity. Many of the competitors have conceived germs of much promise, but have been less happy in developing them. While the junction between the London-road and Cumberland-place has been considered a desirable position for the main entrance by a large number of the authors, very few have thought of an axial arrangement for the entrance and principal department — the lending library—and, as the assessor observes, "it has occurred to only one, the author of the design No. 35, to complete this symmetrical arrangement by placing the lending library in the central line between the reading and news rooms, and at the same time to provide the reference library on the ground floor with easy and separate access from the principal entrance." It was easy, for instance, to draw a line obliquely from the angle of frontage to the apex of the plot as a principle of disposition; but only one design has followed this system. Another important condition of a public library on a large site is that the principal rooms should be on one floor, and we are not surprised that a large number of the competitors, guided by the knowledge and practical experience of the librarian, Mr. Oswald T. Hopwood, have adopted the single-floor arrangement. If the cost is to be taken as any criterion of merit—and we believe in this case the committee have made it an indispensable condition—the two-storied schemes will, of necessity, be placed on one side. No doubt a more dignified elevation is obtained by a second story; but for the purpose of administration the librarian ought to be able to command the whole of the departments on one level. The ground-floor distribution is also decidedly better for lighting.

To take the designs which have been awarded the first and second premiums, Mr. A. E. J. Guy (No. 35) aligns his reading and news-rooms at the obtuse angle of frontage, with the principal entrance between at the junction of main roads. Forming equal angles with the ends of these rooms is the entrance corridor, and in the same axis is arranged the lending library, which is an elongated octagon running north and south. This shape has been given to bring the ends of this room in agreement with the obtuse angle. It is lighted from a glazed roof. The reference library occupies the space on the north-east boundary, being shaped to that outline. On the Bedford-road side the triangular space left by the direction of lending library is filled up with a mending room, store, &c., so that every inch of the area has been utilised. The lobby space for borrowers is obtained by glazed partitions on the canted sides of octagonal end of lending library, and by the counter, which projects into it, there being a door in the centre of hall for ingoing borrowers, and exits on the canted sides, by which arrangement confusion is avoided. Glazed partitions also form the inner sides of news-room and reading room, that in the news-room separating it from the reference library. The access to each department from the central hall is separate. By this plan it will be seen all the rooms are placed on the ground floor, the upper story plan having only the librarian's room—a Continental arrangement to enable a better supervision of the departments—this room being formed by the triangular space inclosed by the sides of lending library and the reading and news room. The gallery round lending library is accessible from this room, which is lighted by an octagon lantern and through glazed partition of lending library. The committee-room forms the angle over entrance with a circular oriel, and the caretaker's rooms are also provided here. By this scheme a complete elevation can be erected within the estimated cost, and the reference library left as a future extension without sacrificing the symmetry of the design. The assessor remarks in his report that the first portion to be erected can be carried out for the sum named. The cubing is taken at 6½d. for the first erected portion, and 6d. for the reference library, as only an external boundary wall and roof will be necessary to be erected, the walls of the lending library and newsroom being utilised for the reference library. The elevations, shown by black chalk drawings, are treated in a plain brick style, with projecting bays to the front reading and news-rooms, with gabled lights above. Certain suggestions are made by the assessor —one is that the librarian's room be omitted and the committee-room be used for the purpose, that the central bookcases in the lending library be placed lengthwise, that a space for storage of books be screened off from the reference library, that the caretaker's residence be placed at the north, and other details. The elevation to the main roads may with advantage be improved. We do not altogether like the outline and details of the entrance block, nor the treatment of the centre below the cupola. On the other side, the author has realised the value of making a good lending library the backbone of a plan that can be developed without disturbing the symmetry.

The design of Mr. Sidney R. J. Smith (No. 4) is unsymmetrical; the lending library faces Cumberland-place, and behind it, placed parallel-wise, is the reading-room, and at the north end the reference library. The newsroom is placed with its front windows to London-road, and is broken to fit the oblique line of the eastern boundary; but the main walls are well arranged in parallel lines for roofing, and are at right angles to the straight line of western boundary. There is a good commodious hall, with librarian's room on the left side, opening into hall by a glazed partition, a good lobby for borrowers taken out of the corner of lending library, and distinct entrances into the reading room and reference library. The latter is a future addition. We object to the waste triangular spaces left on the eastern side, which cannot be utilised, and also to the broken outline of this and the main frontages. An octagon stair turret at side of entrance is carried up as a circular brick tower crowned by a cupola, and this has been artistically treated in red brickwork. The section shows three span roofs, with top lights running along the parallel ridges. All the rooms are on the ground floor. We think the numerous small breaks would entir destroy the value of the frontage.

Other designs show that their auth have accepted the idea of placing the m reading rooms in front, disposed angle-w with a central axis; but from various cau have failed to fully carry out the schen No. 10 (Mr. E. Cooper Poole), has a pl that certainly might have been work out with more successful results. The rea ing room and news-room on each side of t central entrance are well located with fr windows, but the lending department h been sacrificed instead of being made central room. There is a commodic entrance and borrower's lobby in front, a the drawings are bright, and show mu careful study. No. 2 (Mr. H. T. Ha Regent's Park) has a Late Gothic gabl treatment of elevation in red brick a stone, and tiled roof, and the arrangeme of reading and news-room are the same in the last, with a good central entrance a lobby for borrowers projecting into t lending library; but this department spoiled by the irregularity of its shape. is top-lighted. The reference library shown on the western side. The same pri ciple is also seen, but more cleverly manage on the plan of No. 24 (Messrs. Farrow a Nisbett, Winchester) who have hit upon t principle of No. 35; but the lending librar instead of being placed lengthwise with t axis, is disposed at right angles thereto wi its length east and west. The news a reading rooms are on each side of a spacio entrance, each with its distinct doorwa and there is a wide borrowers' spa immediately in front of the entrance pr jecting into the lending library, which lighted by a lantern. The author mak the future reference library a second-sto addition. No. 3, by a well-known hand, a clever set of designs. The elevation, red brick, is imposing, and picturesque treated with some nice detail. The pl shows an ingenious disposition of the room Unlike many others, the author places t lending library on the east side of entran with librarian's room next, so as to comma the entrance. There is a spacious lobby f borrowers, well placed in reference to t entrance, and some useful circular recess in the reading-room on the other sid the entrance corridor appears tortuou though this arrangement was doubtle intended to restore proportion to the roo by throwing the irregularity of the site in the centre. The Bedford-road frontage h been made a more attractive elevati than in many of the other designs the windows of the reading and new rooms. No. 1 (Mr. C. J. Marshall, Gre Queen-street, Westminster), shows the e trance at the north end of front towar the main road, the news and reading-roo being disposed round the angular frontag these have projecting bays. The lendi library forms the north side in connecti with the entrance, and between these bloc a small rectangular area is obtained for ligh but much too small for that purpose. T plan is single-storied, and the referen library is intended to be placed in the northe portion of site. No. 14 is another desi which throws the irregularity of site into t lending library, and the arrangement proposed for the present buildings wou make a very incomplete design. A glaz roof is indicated over this department, whi has a large serving counter. The extern design is rather heavy and formal, in a sort Italian style. Messrs. L. and A. C. Housto Serjeants' Inn (No. 7), adopt a centr hall of circular form, access to which given by a wide corridor entrance. A porti of the circular hall forms the counter to len ing library, which is rather awkward. T news-room is irregular in shape on left entrance. The reading room is entered al separately from circular hall, and is light

the west side. Committee and caretaker's m in the north angle. The hall is domed, th side lights. A clever plan is No. 36 r. S. C. Greenwood, Southampton), based the circular system. The circular lend- ; library, with radiating cases and tables, surrounded by a 5ft. corridor, outside ich, comprising the angles of site, are the ding room, news-room, and reference- rary, fitted with tables. The entrance is the junction of the two roads; the rowers' space is taken out of the lending rary. The design is well worked out, ugh the principle would scarcely be suit- e. The design is Renaissance, of two ries over the entrance block, the circular rary having a lantern roof in centre, with f-lights over the surrounding rooms. other very able arrangement is No. 13 r. H. Branch, Cheapside), who has cleverly naged to fill up the irregular site by ming a bold, semicircular side to the read- -room which faces the east. A central lend- ; library, the axis of which is parallel to lford-road and in a line with the main rance, has the news-room on the west side l the said reading-room on the east. It has an idal end to the north, and a range of iron ars on each side, which carry a gallery. arrangement of this central department leverly managed, and is covered by glazed nsverse roofs in three spans. A two-storied vation, with three stories in the centre, shown, the design being indifferent in le and detail. No. 9 (Mr. Robt. J. Beale, stminster), has a good general arrange- nt, but the elevations in the Italian style much broken, and would be costly. The ner of lending library is made the nter. No. 8 (Mr. S. Liddon Walters, hopsgate-street) has a well set-out plan, walls arranged to fit the site. The news- m fills up the angle between entrance ridor and reading room, and has a semi- gonal front to the road. The position of borrower's counter, forming one side of rance corridor and lending library, which n the north side of corridor, would be onvenient. The librarian is central in ition. The grouping and lighting are isfactory, and the elevations show llioned windows, and a stone treatment Renaissance character is adopted. No. 17 cleverly-grouped plan, with good space lobby out of entrance hall. The reference ary is shown over lending library; ding rooms are top-lighted. A nicely- wn broken-gabled elevation is sent. ome of the authors, to produce regularity the walls of their principal rooms, have, we have noticed before, sacrificed the ametry of the lending library. We only briefly refer to a few others. . 23 (Mr. W. S. Skinner) places the read- -room along the western front obliquely; news-room is on the east side, its end hted in front. It is unfortunate that the hor should have spoilt his entrance by the arian's room, which has been wedged in ween the porch and the news-room, as it ght have been arranged in a more central ition with advantage, and have produced ore regular shaped lending library. No. (Mr. John Johnson, A.R.I.B.A.) has a her expensive Renaissance design; the n has some merit in the reading and ws-rooms, the centre entrances are well ced, but the counter of the lending library awkward in arrangement. No. 37 is an lian design, showing excellent lighting windows which are on both sides of ding-room, and admitting of improve- nt. No. 18 has thrown the awkward gle on the east side into the entrance- l, and has thereby spoilt it for effec- e interior treatment. No. 31 has well-arranged borrowers' lobby in tre between news and reading rooms, reference library being in the rear, as a ure addition. The style is Late Gothic. . 33 (Messrs. Gutteridge and Mitchell, Southampton) has a dignified red brick elevation, a centre with gabled wings; the plan has a rather cramped entrance, though well considered in other respects. No. 27, by Messrs. Karslake and Mortimer, is scarcely happy in the junction of lending library and reading room. Messrs. Quilter and Wheel- house have a set of drawings showing a dignified red brick, two-storied elevation with domical circular corner between news- room and lending library—the latter is arranged on the "alcove" system, and is side lighted. Plan No. 27 is not cleverly disposed, and the junction of lending library and news-room is awkward. We have no space to refer to other designs which have missed the mark. Taking the designs as a collection, they show much talent and considerable labour in their pre- paration. The committee having acquired a larger site than required for the present buildings, it is very important that the design to be erected for the limited sum of £3,500 should be so far complete in its plan and group- ing as to be no disfigurement in its present imperfect condition. Many of the authors, by reserving a space on one side of the plot for the future reference library, have pro- duced designs which would not be archi- tectural or agreeable till they were completed, and those portions erected first within the cost would be not only imperfect, but un- sightly. The selection of a design which contemplated an additional story would be for the same reason objectionable. The main frontage, at least, should be completed in the first outlay; and any reserved space for future extension should be better on the side (the west side in this case) which is less exposed to public view.

HOT-WATER ENGINEERING.—XIV.

Supply of Hot Water for Baths and Domestic Purposes.

other forms of cylinder apparatus.

THERE has only been one persistent attempt to improve upon the ordinary method of connecting up the pipes in the cylinder ap- paratus, and this particular method will be described. It will not, however, come within the province of these papers to offer a criticism, whether in its favour or otherwise; but from the various actions and phenomena that have been explained it will be within the readers' power to judge what advantages, or the reverse, may re- sult from the method adopted. The other un- usual forms of apparatus to be described are the outcome of special requirements, as will be ex- plained.

Fig. 45 shows the apparatus just referred to, which is known as Dyer's system, being pro- moted by an engineer of that name. The cylin- der, as will be seen, occupies its customary place close to the range or boiler, but is some- times placed lower than usual, as the primary re- turn pipe being carried below, there is no special need to keep the bottom of the cylinder above the top of the boiler, as in the ordinary arrangement. The primary flow is carried from the top of the boiler to the cylinder, entering about half-way up, as usual, but, instead of ter- minating there, it is branched just at its con- nection and continued up the house, having also communication with the top of the cylinder, as shown. This practically amounts to a connect- ing pipe being put in between the primary and secondary flow pipes, as shown in dotted lines at Fig. 46.

After leaving the top of the cylinder this pipe is carried in all respects the same as an expan- sion service or secondary flow, and it is returned in the same manner, except that its lower con- nection is different to what has been explained up to the present, and is quite peculiar to this system.

From the illustration (Fig. 45) it will be seen that the return does not enter the cylinder at a high point, but is carried right below, and one branch is carried up into the bottom of the cylinder, and the other is carried on and turns up into the bottom of the boiler. It may occur to some of the readers that to circulate below the boiler is opposed to general good results, but this is not the case. In some instances it becomes desirable, and with ordinary precautions it can be effected with every satisfaction and quite free from objections.

The most uncommon feature in this apparatus

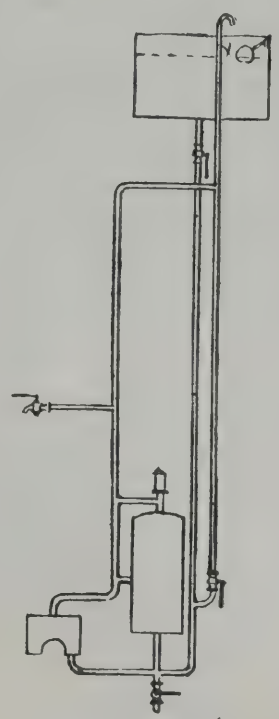

FIG. 45

is the point at which the cold supply service is connected. This enters the secondary return pipe down near the cylinder, as shown, so that upon the opening of a tap the cold water flows directly into this pipe. It will be noticed that in the drawing the secondary return pipe is shown as entering the cold supply, but the re- sult is the same either way when a tap is opened, and so also is it when the taps are closed and the water circulating. In the published illustra- tions of this apparatus a safety-valve is shown affixed to the top of the cylinder as now illus- trated (Fig. 45). The writer cannot bring him- self to agree with this as being the correct posi- tion for it, as will be fully explained when speaking of these articles.

The peculiarity of inserting a connecting pipe between the primary and secondary flow pipes, as Fig. 46, can often be put to good use with an

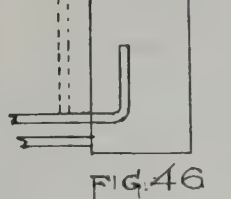

FIG. 46

ordinary apparatus when circumstances make it desirable, as the effect is to get hot water in the secondary flow quicker than when all water from the boiler has to pass through the cylinder. This result, however, only permits of a limited quantity being obtained in this shorter time.

When the flow pipes are connected up in this manner the water in circulating normally passes up the flow pipe from the boiler in the usual way, but upon reaching the cylinder only a part enters and takes the passage through and out by the secondary flow at top, while part takes the direct passage through this connecting pipe from primary to secondary flow without affecting the contents of the cylinder. The result is that the water which takes this direct route arrives up at the draw-off taps quicker by a deal than that

which has to find a passage through the cool water in the cylinder, but, of course, it is only the contents of the pipe that can be drawn hot, and unless this pipe be of considerable length the quantity of hot water will be very small. Of course, this only alludes to the time at which the fire is first lighted and the contents of the apparatus cold, or nearly so.

An instance in which this method was adopted successfully occurred where there was just one bath of very hot water wanted every morning. The existing apparatus of the ordinary cylinder system was unable to give this unless the fire was lighted very early, the reason being that the boiler in the range was hardly powerful enough, and the pipes (secondary flow and return) above the cylinder extended a considerable distance. This length of pipe, which amounted to about 120ft. each way, held sufficient water to materially increase the aggregate contents of the apparatus, and the distance it reached necessarily made the time longer in which the hot water could reach the bath in question, which happened to be nearly at the furthest point.

In this case the long length of pipes and the quantity of water contained in them was put to good use in the following way: It was found by rough calculation that the pipes themselves held more than sufficient water for the one bath required, and it was therefore proposed to rely upon their contents for this purpose without drawing from the cylinder; but that this water might get hot more quickly than hitherto the primary and secondary flows were joined as Fig. 47, which practically allowed all the heated

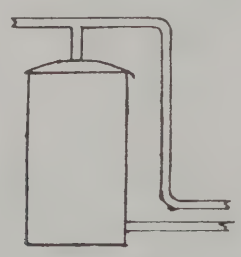

FIG. 47

water from the boiler to go directly up to the point required, and consequently in the shortest possible space of time. This was successful, but the method is not recommended; only shown to illustrate what can be done to meet a very special circumstance. The drawbacks to this are, firstly, the limited quantity of water that could be drawn *hot*, but which would, of course, be very quickly replaced; and there would be a great loss of heat from these long service pipes, as the hottest water passes directly into them; and consequently there would be the utmost need of their being covered to prevent radiation, or good results would be greatly minimised. The important subject of covering pipes, &c., for the conservation of heat will be treated in the next paper.

BOOKS RECEIVED.

Dilapidations: a Textbook for Architects and Surveyors, 4th edition, with the most recent legal cases, by Banister Fletcher, Professor of Architecture and Building Construction King's College, F.R.I.B.A., &c. (London: B. T. Batsford, High Holborn), is a new and enlarged edition of a textbook well known to our readers. It is unnecessary for us to dwell again on the merits and arrangement of this treatise. The tabulated form in which it is arranged has many advantages for business men as well as students. The rights and liabilities of lessors and landlords, of lessees and other tenants, are concisely thrown into distinct paragraphs easy of reference and concise in statement. Thus, for example, a lessee looking over Table II. will see at one glance that he cannot compel his landlord to repair unless bound by contract; "that he must pay rent though premises be burnt down, unless there is an express covenant that rent shall cease"; that there is "no implied covenant that if landlord omit to do the repairs according to covenant he may do them, and deduct the amount from the rent"; that he is liable to repair even if roof be stripped by the wind"; and is liable to rebuild if house be blown down by tempest, and so on. References to legal cases are appended as footnotes to each page. The construction and meaning of covenants is also thrown into the form of a table, which can be committed to memory if need be. Thus the usual phrases, "habitable" and "tenantable repair," "good repair," and other terms are explained by reference to decisions. The method of taking dilapidations and waste is described item by item. Lord Esher's recent decision as to the meaning to be attached to ordinary covenants is quoted at length. Our readers may remember the judgment, which we gave and commented on, and which will henceforth be taken as a standard authority on the subject. Chapter VI. should be carefully studied by every student and young architect, as it gives dilapidations scheduled under the several trades, based on the covenants usually inserted. These are explained by notes in smaller type. The duties of surveyors, actions at law, the appointment of referees and umpire, under the Agricultural Holdings Act, 1883, are discussed. The appendix contains a useful epitome of dilapidations in the form of question and answers, which will be found of practical value; also extracts from the Conveyancing and Law of Property Act, 1881. A comprehensive and full index is given, and this edition may be regarded as being a very complete handbook on the subject.——*The General Machinist:* a practical introduction to the mechanism and machinery, edited by the editor of the "Industrial Self Instructor" (London: Ward, Lock, and Co.) This is an elementary treatise uniform with "The Stonemason and Bricklayer," lately noticed by us, and contains over 200 pages of closely printed instructions on mechanism, tools, and the general work of the machinist. The book is copiously illustrated by diagrams of mechanical details, and has at the end four folding plates illustrating details of steam-engine, force pump, machine tools, &c. The student and apprentice in the workshop will find many useful hints and suggestions.—— A new edition of *Walks in Epping Forest*, Percy Lindley's readable handbook to the Forest paths, has just been published; it is handy in size, and well illustrated.——*Bits of Canterbury Cathedral* is the title of a small but somewhat pretentious book which has just reached us, affording once again undoubted evidence of the trite remark that the more incapable the draughtsman the more ambitious frequently is his choice of subjects. Canterbury Cathedral, of all buildings in the country, has so often been well illustrated, like Salisbury and other familiar monuments of ecclesiastical art, that to represent it again in poor perspectives wretchedly reproduced serves no good purpose whatever. Our English cathedrals have suffered enough at the hands of vandals in the past, and that fact furnishes all the more reason why they should not be caricatured nowadays by would-be illustrators, who, in attaching their names to scribbles of our magnificent minsters and cathedrals, seek to be associated with great works of historic interest. The general perspective of Canterbury Cathedral, with which Mr. Walter Tallant Owen opens his book, shows the building in its entirety from an actually impossible point of view, and, like the rest of the drawings which follow, it is very poorly delineated. The baptistery, one of the most picturesque and interesting features in the cathedral precincts, is quite spoiled, and so is the well-known Norman staircase in the Close. The volume is published in New York by Wm. T. Comstock.——It is a pity that the Society of the Medical Officers of Health, and their editor, A. Wynter Blyth, M.R.C.S., couldn't invent an original title for the periodical they conduct, and in which they have published the reports of the recent Hygienic and Demographic Congress. *Public Health* was our title and our property, and, when discontinued, was amalgamated with this journal. We shall not trouble ourselves about the people who have picked up our old clothes; but really they might have turned them!

COMBINED PLUMB AND LEVEL.

A COMBINED plumb and level, which promises some advantages, has been patented in the United States by Garner and Connaughton, of Latourell Falls, Oregon. The sides of the stock form straight edges, and at its lower end is a mortise in which plays an inclosed plumb-bob over a glass plate provided with graduations visible through an opening. The bob is also visible through side glasses, through which likewise may be seen a removably secured

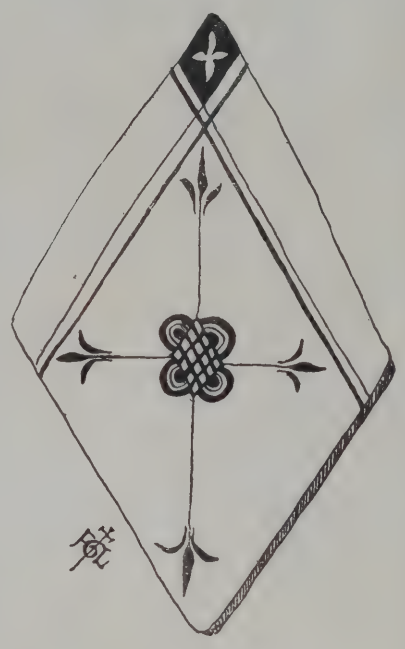
spirit-level set transversely in the stock, the cord by which the bob is suspended being seen across the level. A short steadying rod projects into an opening in the upper part of the bob, to prevent its rotation and permit a limited swinging motion, and the bob-cord extends up through a central recess or channel in the stock, a tubular extension being also supported to slide in the stock, through which the cord may be passed, to be secured to its cap, around which the cord may be wound when the tube is lowered into the stock. There are guide-lines on the stock and on the extension, whereby the latter may be set accurately, and the extension has an arm or cross-bar whose ends are in line with the straight edges of the stock, adapting the device for use on a longer surface than when the extension-tube is down to the stock. At one end of the stock is a spirit-level, and in its opposite edge is a swinging gravity-level, the weighted pointer of which is seated in a mortise having glass top and side plates, the latter marked with graduations. In a modified construction the recess for the bob-cord is mortised in the face of the stock and covered by a glass plate, the suspension device being a pivoted bar having at its upper end a pointer registering along a graduated scale.

ST. MARY'S, AMERSHAM, BUCKS.

By FREDERICK GEORGE LEE, D.D., F.S.A.

THERE is probably no town within thirty miles of London which still retains its leading ancient architectural features more markedly than Amersham, in the Deanery of Burnham, and county of Bucks.

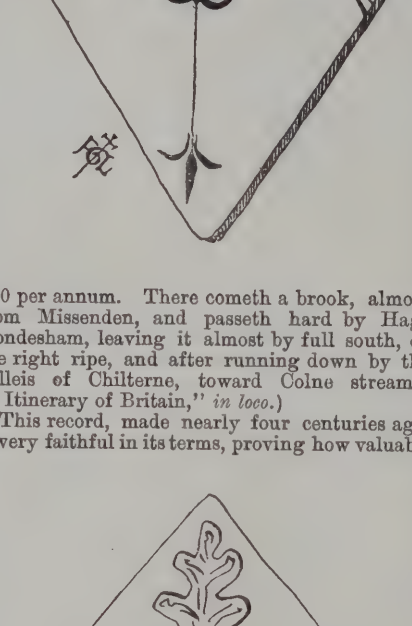
As regards its houses and streets—very ancient and irregular, and exceedingly picturesque—many of them are Elizabethan, or of the earlier part of the 17th century; while the church, the Classic market-hall in brick, and the notable Drake almshouses,* harmonise tolerably well with all the more ancient Domestic edifices on either side of the long, single main street. There were several old hostels, here and there, a few good gentlemen's houses in the town;† a remarkable ancient building on the south side of the High-street, which was probably a cell or offshoot of some influential religious house. And although this building now comprises a saddler's shop and a straggling but capacious dwelling-house, it contains several features of architectural interest and archæological character. Some of the windows are very old; the oaken mouldings and chamfers are uniformly excellent, while certain of the recently covered-up pargetting is very artistic and well done. Moreover, the main part of the older cottages throughout the town are of singular antiquity and picturesqueness.



Anciently, Amersham returned two burgesses to Parliament. When it first became a borough remains uncertain. The earliest recorded members are Robert le Warrener and Ralph att Grove, A.D. 1300, and it was disfranchised in 1832.

There are four ancient manors, or reputed manors, in Amersham—viz., Raans, Shardloes, Wedon Hill, and Coleshill.

These have been held by the families of De Latimer, Brudenell, De la Vache, De Mandeville, Bohun, Tothill, Russell, Drake, Proby, Waller, and others. In certain cases the old manorial rights have been lost, while, as regards Raans, the substantial manor-house is now occupied by a farmer. This was built by a member of the Proby family, though one or two of the lower rooms are evidently of much greater antiquity.



John Leland, vicar of Haseley, co. Oxon, the well-known and careful antiquary, thus describes it. He visited it under Henry VIII., and wrote in Edward VI.'s reign:—

"Hagmondesham, alias Hamersham, a right pretty market town on Fryday, of one street, built with tymber, standing on Buckinghamshire and Chilterne, two miles and a half from Little Missenden. The D. of Buckingham was chiefe lorde of it, vice the kinge; now the Lord Russell by gift, whoe dwellyth at Cheineis, 3 mile of by east. The paroch church standeth by north-east toward the middle of the town; and in a chapple on the north syde of it lyeth buryed Edmund Brudenell, father to Sir Robert Brudenell, late chief-justice of the Common Pleas, and Drew Brudenell, older brother to the said Sir Robert, and Helen his wife, daughter to —— Broughton, who dwelt at a Manor of his,

£40 per annum. There cometh a brook, almost from Missenden, and passeth hard by Hagmondesham, leaving it almost by full south, on the right ripe, and after running down by the valleis of Chilterne, toward Colne stream" ("Itinerary of Britain," *in loco.*)

This record, made nearly four centuries ago, is very faithful in its terms, proving how valuable

the results of Leland's peregrinations have been to subsequent students. At a period when change and destruction were working such havoc, he at all events efficiently aided in the preservation of facts, records, and traditions. The parish church of "Our Blessed Lady of Agmondesham," as it is termed in a deed dated 1492, stands a little to the north, about the centre of the town, and is a structure of good proportion and considerable size and interest. No account of it is on record in Domesday Book, its name being not even mentioned; but a Christian sanctuary and altar have no doubt stood here, though probably but small and humble, ever since the days of St. Birinus, of Dorchester. As at present built, that is, so far as the cruciform ground-plan is concerned, the church of Amersham was prob founded by Geoffrey de Mandeville,* who g it to the Abbot and Convent of Walden, in Es In the 22nd year of Edward III., the patron of the benefice was claimed and exercised by Abbot of Brecknock. Two, at least, of rectors became bishops, William de March Bath, and William Grey, Lord High Treas of England, and Bishop of Ely. The Rec House, a large and comfortable mansion o eminence to the north-west of the church beautifully situated. It appears to be about years old. On the south of the churchyard st a range of very old and picturesque brick timber erections, houses, shops, and out-bu ings, one of which, possibly that at the west of the block, was known as the "Church Hou where of old the sacristan and caretaker of church lived. The churchyard, which cont a remarkably old yew-tree, is full of graves memorial stones. It is not now open for buri a church cemetery, to the north-east, and near, being now used in its place. From a note made by an accomplished architect al fifty years ago, and subsequently publishe substance,† a good idea of the general ar tectural character of the church, as it then may be obtained.

"It consists of chancel, nave, clerestory, aisles, transepts and porch on the south side, tower of three stages at the west end. Ther nothing remaining earlier than Perpendicu except it may be some of the piers to the n which have the appearance of Late Decorated. church has been much modernised, and ther but little good work left. Perhaps the best is groining of the south porch, which has some bosses at the intersection of its ribs."

To the above may be added the fact that in restoration of twenty years ago, many fragm of stone carving were discovered, indicating the original edifice was probably of a Norman or Romanesque character, and several sculptured fragments of the dog-t ornament, within a deep hollow moulding, discovered in certain blocked-up windows, again opened. Portions of the latter fragm are still preserved, with several others of a date, in the Drake Chapel. It may also pointed out that in the south side of the chanc then partially restored and rebuilt from foundations—fragments of a Romanesque str course, of a well-known type, were discov in the lower portion, within a foot of the gro —a batch of facts which show remains of a ancient Christian sanctuary.

As a whole, the sacred building ranks onl the second-class of Buckinghamshire churc It is distinctly below those of Aylesb Wycombe, and Chesham in size, plan, inte and dignity, though not devoid of architect beauty and character. Its main parts of ex lent proportions are of Third-Pointed st though repairs and additions in Debased style a subsequent period ‡ have been frequently m Substantial alterations and new work were, recorded, added *circa* A.D. 1660, and ag about the year 1708. The interior at period, stuffed full of deal galleries, high p common benches, and "curtained pews for quality"—as is recorded—was restored abou years ago, when several Second-Pointed wind were inserted; but some objects of inte

* These were built in 1617 by Sir William Drake, Bart. Over the front door are the arms and crest of the family, with the following inscription:—"Sir William Drake, of Shardeloes, in ye County of Bucks, Knight and Baronet, in the year of our Lord 1617, to the Glory of God, and for the relief of Six Poor Widows well reputed in this Parrish, hath built Six Almshouses, with all conveniences to them, and a very good allowance for ever, at his own cost and charges."

† Notably that belonging to Mr. John Chase, the artistic and archæological contents of which, many of them collected by his late kinsman, the Venerable Archdeacon Freer, are full of interest and value. Books, pottery, enamels, pictures, and prints form a remarkable collection, of which, by their owner's favour, the present writer made a too-brief recent inspection.

* Geoffrey de Mandeville, whose chief mansion w Walden, in Essex, where he founded a monas married twice, and his son Geoffrey in turn ma Rohesia, daughter of Alberic and de Vere, Earl of Ox and was himself created Earl of Essex. The de Ma villes owned many houses and estates both in Bucks Oxon. Stoke Mandeville in the former county is na from them. They were likewise large benefactor religious houses, and the original founders of sever various shires. For a pedigree of the de Mandev who were also Lords of Rycott, in Oxon, see pp. 331- of my "History of the Prebendal Church of the B. of Thame."

† Mr. William Caveller.

‡ From the Domestic State Papers of Charles the F reign, the results of a formal visitation by Williams, Bi of Lincoln, A.D. 1637, are on record. As regards Amers the following is preserved:—"The wainscot round a the communion table to be made lower by 14 inches the kneeling benches to be made lower and broader. is Erasmus [i.e., his Commentaries.] To provide a chalice and two covers—one for that which is there the other for the new one. To have a convenient he There be two flaggons. North aisle wants pavi many of the seats in decay. The boards that are set the backs of the old seats to be taken down. Mr. Gr wife's seat—the boards to be taken off, and the door made even with the old seat. All the high seats taken down to the mark near the chancel—viz., four seats on the south side and Sir Thomas Sand's. The of the organ is in some place of the town."

re removed, destroyed, or lost, while recently interior has been effectually renewed and ll-repaired in general good taste and with at picturesqueness, and this within the last years. Possessing now no galleries, it can ily seat about 1,040 persons out of a present ulation of 3,000. It is held as a benefice h the adjacent hamlet of Coleshill, where re is a modern chapel-of-ease, under the care he Rector of Amersham.

ertain of its architectural features are worthy more particular notice.

he arches of the nave are graceful and well-portioned, while the roofs of nave, transepts, choir are not wanting in good effect. Some w windows, in excellent taste, have been erted in place of those decayed and dilapidated hat at the east end of the Drake mortuary ng of good design. New clerestory windows re been likewise put up; while outside, tead of a mean and debased battlemented sting of brick, a well-designed band of free-ne now crowns the walls of the nave.

he nave and chancel are somewhat narrow, the aisles are dark. The tower at the west is of excellent proportions, while the new ne turret at the top of the vice or staircase es greater external picturesqueness and effect t. The organ stands in the south chapel. e altar-table is fairly raised and furnished; the stone reredos is somewhat commonplace. e stalls are solid and good. There is an ex-ent vestry to the immediate north of the ke mortuary chapel, in which there are two iron-bound chests with several locks. Here re were anciently some fragments of ancient s—broken figures and quarries; but these e been lost or removed. Of two ancient rries, now in cottage windows, sketches are n.

he east window of the chancel, of five lights, filled with good old foreign stained glass—t probably of Flemish work. It stood ori-ally in a private chapel at Lamer, in Here-dshire—which belonged to the ancient family Garrard, a race allied to the Drakes—and tains dignified figures, well designed and very in colouring, of ten of the Apostles, all edingly effective.

here are several other modern windows, of ed merit, in stained glass, some of them dsome. Two of these, at least, contain too h dark-coloured glass, which, very unneces-ly and unwisely, tends to darken the sacred ding, for the clerestory windows of the nave o large a structure are proportionately small, do not let in too much light. Care should be riably taken to exclude the use of staring urs, dull backgrounds, and dark glass in ern windows.

There are several brasses* remaining of considerable interest. Most of them, however, have been moved, and some, to avoid their being trodden upon, are now placed on the walls. The earliest is that of Thomas Carbonell, Esq., and his wife Elizabeth, in a good state of preservation, though some of the letters of the inscription are lost.

There is another brass, of a bold and effective design, supposed to represent William Brudenell,† which formerly had shields charged with the arms of Brudenell impaling Raans in its upper part‡; and another of the same race—Henry Brudenell, Esq., and Alianora his wife, daughter of Hugh Preston, son of Sir Thomas Preston, Knt.

Another represents a very ancient race, who took their name from Penn, an adjacent village to the town—John de la Penne and Elizabeth his wife, daughter of Peter Hally. And another, John Drake, son of Francis Drake, of Esher in Surrey, by Katherine his wife, aged 4 years.

There can be little doubt that the present vault and mortuary chapel of the Drakes of Shardloes, on the north side of the chancel, stands on the site of the old de Mandeville burying-place, and possibly on that of the Brudenells likewise. In certain old deeds—of which I possess partial abstracts and some curious notes—the chantry of the Brudenells is expressly referred to, and it is implied that services for the repose of the souls of the dead were frequently said in the reign of Henry VII. The existing Drake vault is large and well arranged, while the capacious chapel over it—full of modern monuments in Sicilian marbles—is of fine proportions. From these and the ordinary family records an interesting and acceptable "History of the Family of Drake of Buckinghamshire" might be compiled, Dr. Lipscombe's account being very imperfect and inadequate. But the chapel wants a Communion-table, stalls, and other proper fittings, for at present it is an empty desolation, and is a contrast to such places as they were in the ages of faith.

The other monuments of varying sizes and characters are numerous, and some of them very handsome—especially those belonging to the Drakes in the chancel. These are in good order.

In the north transept there are several marble tablets commemorating members of the Weller family. Their residence is called "The Plantation"; while at the west end of the south aisle a large tablet to the memory of a member of the Bucks family of Ayres remains.

The late Mr. Preedy, a London architect, restored the interior of the church, about twenty years ago, and did his work conscientiously and effectively. The exterior has been quite recently carefully dealt with by Mr. J. S. Alder, who deserves commendation. Perhaps greater simplicity might have been aimed at in some details. Anyhow, the result is, on the whole, very creditable and picturesque. The accompanying sketch was made before the last and latest restoration.

* There is a careful and exact list, p. 19, with all the details of dress given in Haines's "Monumental Brasses" (London: 1861)—a volume of the highest merit and interest. This may be consulted by those who desire further information on the subject.

† Edmund Brudenell, of this family, Lord of Raans, who held that manor in 1469, had by his first wife a daughter Alice, who married Richard Waller, of Groombridge, in Kent. Possibly this alliance may have led to the Wallers settling in the parish of Amersham. The register of the Baptism of Edmund Waller, the celebrated poet, stands thus in the Amersham Register book:—"1605, March, Edmund Waller, son of Robert Waller, Esq., baptiz'd ye 9th." He was buried in Beaconsfield churchyard in the year 1687.

‡ An artist without a reasonable knowledge of heraldry and genealogy finds himself robbed of a science admirable in itself, full of collateral guides and aids, by which so much may be learned of history and so much more may be taught.

CHIPS.

Messrs. Gething and Grice, general stone merchants, have found their London, suburban, and country business extend so rapidly that they have, for the greater convenience of their customers, taken a railway wharf and offices, at Nos. 191 and 201, Warwick-road, Kensington (G.W.R. depôt), within five minutes of the Addison-road, Earl's Court, and West Kensington stations. They will open the wharf on September 21, as soon as the necessary alterations and erections are completed, as a general building and monumental stone depôt, and keep a large stock of block and slab stone used in the building and monumental trades—viz., Portland, Bath, hard York, Robin Hood, Howley Park, Newbiggin, Aspatria, Dumfries, Mansfield, Painswick, Hopton Wood, alabaster, and numerous other stones.

At Tuesday's meeting of the Town Council of Dudley, it was resolved to borrow £5,000 for the purchase of a recreation ground at Eve Hill (£300), another at the Buffery (£926), for the site of a fire station in Priory-street (£1,300), and the widening of Stone-street (£2,500).

It has been decided to close the old Court House Police-station in Glasgow, and plans were agreed upon on Friday for the erection of a new police-station in East Clyde-street. The new building will be constructed at a cost of from £3,000 to £10,000 and is to be three stories in height.

St, Nicholas Church, Liverpool, was reopened on Sunday after restoration and decoration carried out by Messrs. G. H. Morton and Sons, of that city.

The failure is announced from Bradford of Joseph Smith, land agent and surveyor, carrying on business with others under the name of Smith, Gothard, and Co. The liabilities are over £60,000, of which £48,000 are in connection with land speculations at Ilkley, carried on by the Victoria Land Company, most of which is secured. The estate is expected to realise 10s. in the pound.

WAYSIDE NOTES.

APOSTLES of handicraftsmanship who wage relentless war against all manner of machine work will have been stirred to unwonted depths by the announcement of the "Universal Wood-Carving Machine Company, Limited." This concern, which has been, or is to be, launched with a capital of £80,000, is promoted to purchase the English and foreign patent rights of a machine which "will execute with great speed and accuracy reproductions of carved panels, &c., of the finest workmanship, at about one-tenth the cost of hand-carved work." So here we have another step in the wrong direction, from a true artistic point of view, howsoever beneficial and useful the machine may seem to furniture manufacturers and others. Machine-made joinery was considered a "come-down" in its day; but here we are to have wood cut and carved in divers ornamental patterns by certain ingenious pieces of mechanism, operated by boys at "four dollars to six dollars per week," with one man in charge to look after the machines, keep the tools sharp, and lay out the work for the boys! No need to go without wood-carving in the home in the future. And perhaps the Company in arguing that the public, if able to purchase furniture, &c., "with handsome covered decorations" at only a slightly increased price as compared with similar articles in plain wood, "will naturally choose the former," are correct in their surmises, much as we may regret the time and manners that permit the choice. In view, however, of machine carvings on furniture, the small minority will more than ever stick to the neat plainness and decent comeliness of uncarved wood.

Manufacturers intending to send out goods to the Chicago Exhibition will be interested to know that a member of the British Legation at Washington has been making personal inquiries at Chicago as to what department among the industrial arts will have most chances of success. As a result, he believes that fine porcelain, the higher class of ornamental furniture, cut glass, tiles, jewelry, gold and silver work, and fine arts in metals, tapestries, and decorative stuffs, mosaics, and stamped leather will find the readiest sale.

The outcome of the offer of General Pitt-Rivers to purchase Old Sarum from the Dean and Chapter of Salisbury, is that the Dean and Chapter have resolved to maintain possession of the place, while taking measures to place it under the Act for the Preservation of Ancient Monuments. I do not know whether General Pitt-Rivers was acting officially in making the offer, but take it that he was, and that had the dean and chapter, with the concurrence of the corporation of Salisbury, agreed to the offer, the site of Old Sarum would have been the scene of archæological explorations, which, from the nature of the place, would have been calculated to afford many very interesting discoveries of remains of antiquities and indications of old buildings. It is said that the question of the sale of the site of the old city aroused much public interest with lengthy *pro* and *con.* discussions. Judging by the result, the *cons.* prevailed, and I, for one, am glad. It is not every site of antiquity that we would wish to be ransacked. Let the old bones and stones rest in peace, and the halo of pleasing mystery and imagination—quickly dispelled by matter-of-fact research—hang over the place for ever.

Carlsbad, judging from the description of a writer in the *St. James's Gazette*, is in quite the same way as the Rhineland of the *Saturday Review*. Speaking of the association of Goethe with Carlsbad, and of the erstwhile limpid clearness of the Tepl stream, the writer says that in those days "the wanderer by the banks of the stream may never have had to hold his nose lest the smell should sicken him: at present the odour unpleasantly resembles that at Barking Creek, where the sewage of London makes its presence painfully felt. In Goethe's day the coal of Bohemia lay undisturbed beneath the surface of the ground, and wood was used for cooking and heating. That coal is now burned as fuel, and gives off dense smoke in the process, and the air of Carlsbad is not purer than the waters of the Tepl." The insanitary condition of this Bohemian bathing resort is pointed out, showing that, when we are fairly sanitated-up in this country, there will yet be other worlds for sanitarians to conquer. Carlsbad is determined to be up-to-date in the matter of illuminations, having recently introduced the electric light in the streets; but some matters concerning drainage appear to be in an inferior condition to what one might reasonably expect at an extensive resort of wealthy persons, expectant of relief from manifold diseases.

Even architects should not essay difficult mountaineering without responsible guides. Herr Glückel, an architect of Vienna, who was taking a tour in the Austrian Alps, and is known to have ascended the Hoch König, near Bischofshofen, without a guide, has been missing since August 19. We shall all hope that Herr Glückel has come to no harm; but the length of time that has elapsed since the 19th of last month is by no means reassuring where mountaineering is concerned.

Architect readers will have observed your note last week respecting the proposed, or possibly inaugurated, limited liability company for "architecting," surveying, engineering, and auctioneering. I cannot prognosticate a very rosy look-out for shareholders in the concern. The promoters should have thrown in a few other businesses—say the law and medicine—and opened a cheesmonger's department for the convenience of customers. Then when architecture was flat, and nothing "moving" in the surveying and engineering way, while no one wanted to sell off their goods and chattels, there might yet be a prime market for cheese and dairy produce. When about to venture in a new line, there is nothing like "going the whole hog," which reminds me, again, that pork and bacon would go well with the cheese, and give a generally bristling—if not brisk—air to the whole concern.

The time for sending in designs for the Bath competition has been extended, though by a very few days when compared with the misguided liberality of many competition promoters. Judging by the nature of the second advertisement emanating from the Guildhall, at Bath, there are plenty of competitors for the work of making additions to the new town hall.

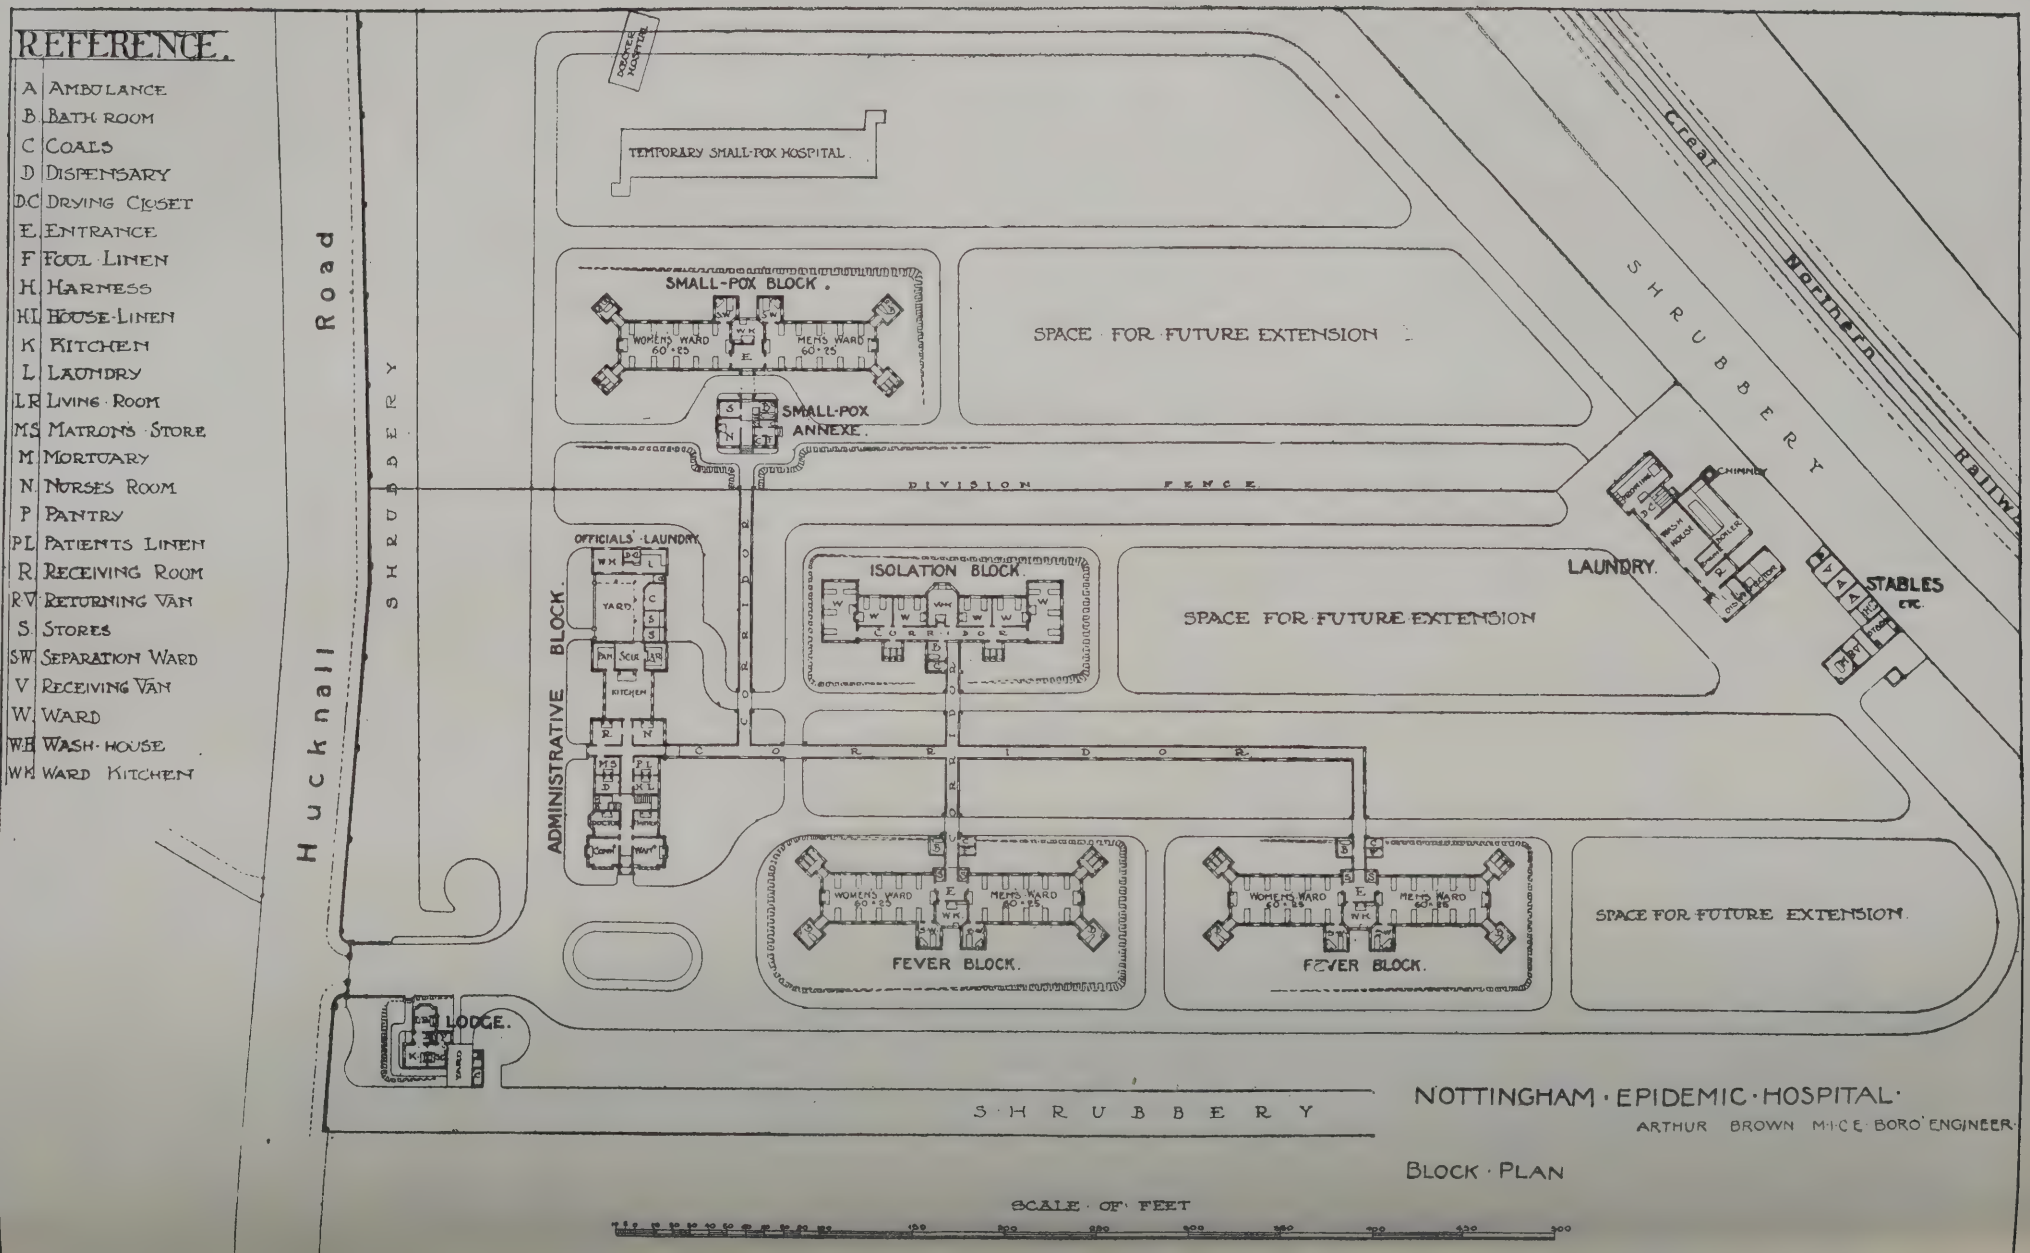
The restoration of the parish church of Burnham Thorpe, Norfolk, suggested, as will be remembered, by the Prince of Wales, is not the only work to be done at Burnham to commemorate the birthplace of Nelson. The memorial scheme includes a public hall, and a foundation-stone of this building was laid by the Countess of Leicester on Monday afternoon. Besides the Prince, the Queen, the Duke of Edinburgh, and the Duke of Cambridge have been contributors to the fund. The cost of the church restorations will be £10,000.

What right has an architect who restores an old church to put his name to representations of the building as "architect" of the same? I never could see much, morally or otherwise. It may be a more excusable sin when the restoration embraces some radical alteration to the church, in which case, however, the work is not one of restoration, and, therefore, the point at issue does not affect such buildings and their architects; but it is no uncommon thing to see, say, in the Royal Academy exhibition, a drawing of an old church whereunto some architect has tacked a down-pipe, or wherein he has put in about three and a half new stones, thereby spoiling the whole internal effect; or laid down a few square yards of glaring encaustic tiling; and whereunto he has thought fit to append his name—as "architect," forsooth!—of the building. The public must often be misled, even if the profession knows very well that such a one is no more the architect of the building than "the man in the moon." It would be more open and honest to say "Restored by Messrs. Vandal," or "Architect to the restorations, Mr. Iconoclast"—or whoever the restorers may have been. To append one's name as architect simply is to deceive the unwary. In reality, those restoring old buildings are rather *surveyors*, as the architect who looks after repairs and restorations to our Metropolitan basilica is called the "Surveyor to St. Paul's Cathedral." This is no sudden fancy on my part, but a view I have held for years, and been frequently tempted to put forward herein. the cap fits anywhere—as it might well do innumerable directions—may it be recognise and an alteration in custom betoken a growi candour on the part of a certain section of t profession.

A correspondent sends me a leaf from t *Commercial Compendium* of Aug. 26, in whic among the extracts from the Registry of Dee of Arrangement I note the following:—

Knowles, Eli, 3, Palatine-buildings, Glebe-street, Gr Harwood, architect, tobacconist, and chipped pot dealer. Assignment. Trustee, John R. Ecroyd, Accrin ton, accountant. Date, Aug. 17th; filed, 24th; liabilit secured and partly secured, £479 5s.; unsecur £216 12s. 1d.; property after deducting claims, £69 8s.

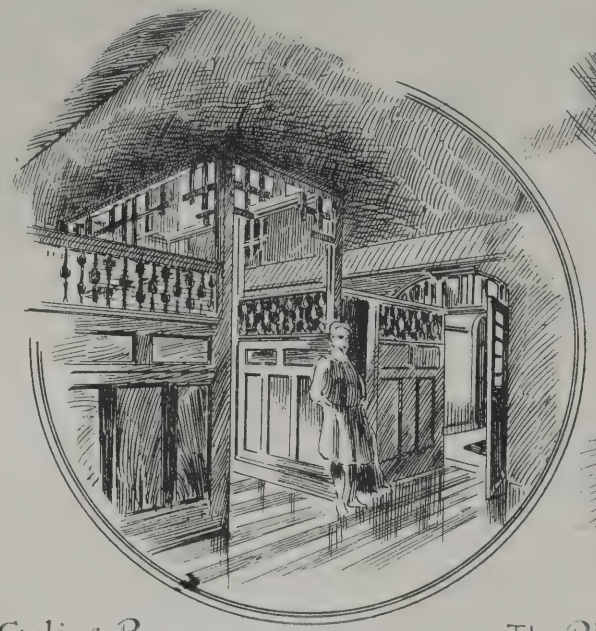
I wonder whether Eli came to grief on arch tecture, tobacco, or chipped potatoes? I ho he will start again soon, and with better luc This is a case no doubt in which the comi examination for the F.R.I.B.A. might be di pensed with. The Institute hates Registratio and if anything but Registration will meet su instances as this, I should be glad to hear wh it is. If only Eli had entertained the A. instead of the gentleman with the uncook lettuces!



GOTH.

GEOMETRICAL ENCAUSTIC AND MOSAIC TILES.

A VERY handsomely illustrated catalogue designs has been brought out by Mess Carter and Co., of Poole, Dorset, who receiv the Prize Medal and Star certificate awarded the Society of Architects for superiority of wor manship and material. The plain floor ti made in various colours, shapes, and sizes, are a very excellent manufacture, and the desig are noticeable for their nice arrangements a harmonious blendings. Plate 1 shows some e ceedingly good patterns for vestibules, corrido halls, verandahs, and other purposes, at abo 5s. 6d. per square yard, centre and borde The grey, dark chocolate, red, and buff are t chief colours, and these, by different arrang ments and proportions of the buff, produ several degrees of light and darkness, the t extremes being red and black, and red and bu disposed diagonally. In plan 2, several n combinations and richer effects are seen. Desig 5720, 5780, 5800, 5700, and 5750, plan and No. 5540, 5560, and 5550, plan 5, very pleasing and harmonious arrangemen For chancel and sacrarium pavings, seve appropriate designs are to be found, and for th and rural decoration, and reredos work, we m commend the patterns on plate 9. For gla hearths, plates 10 and 11 may be consulted fo variety of plain glazed and embossed heart Several very rich effects are produced by a co bination of embossed, hand-painted, and gla tiles. The panelled patterns are very handson Several arrangements are shown for slabb hearths and cheeks, composed of rich-colou enamelled tiles, the latter being in one pi about 1½in. thick. Plate 13 shows seve patterns of delicate-tinted wall tiles and da borders and fittings. The Keramic-mosaic p terns, Plate 8, are very chaste and in refi colourings. Various other kinds of tiles—u glazed, printed, picturesque, mosaic, terraco tiles, and mouldings—are illustrated, and prices are affixed to every pattern, each of wh has a number for reference. Important dir tions as to cleaning and ordering are given. recommend Messrs. Carter and Co.'s new book designs to the notice of every architect bef specifying tile-work.



The new schools, Loanhead, are being warm and ventilated by means of Shorland's patent Ma chester grates, the same being supplied by E. H. Shorland, of Manchester.

The block of premises at the corner of Lo Causeway and Westgate, Peterborough, is be rebuilt for Alderman Barrett, of that city, who previously reconstructed the premises on the oppo side of Long Causeway. The new premises, wh will be let off as shops, occupy an area of 83ft. 41ft., and will be four stories in height. external walls above the ground floor are fa with dark-red brick, from Rowlands Castle bri yards, Hampshire, and stone dressings are fre introduced, to suit the style, which is an adap tion of Elizabethan. The works are being carr out by Mr. Gray, contractor, of Westwood-ro from the designs of Mr. H. M. Townsend, also Peterborough.
